THE CENTRAL ARIZONA PROJECT

WEDNESDAY, MARCH 30, 1949

HOUSE OF REPRESENTATIVES,
SUBCOMMITTEE ON IRRIGATION AND
RECLAMATION OF THE COMMITTEE ON PUBLIC LANDS,
Washington, D. C.

The subcommittee met, pursuant to call, at 10 a. m. in the committee room of the House Committee on Public Lands, New House Office Building, the Honorable John R. Murdock (chairman of the subcommittee), presiding.

Mr. MURDOCK. The subcommittee will come to order.

We are convening as the Subcommittee on Irrigation and Reclamation of the Committee on Public Lands to take up for hearing H. R. 934, my bill, and H. R. 935, an identical bill introduced by my colleague from the Second Congressional District of Arizona, Congressman Patten, entitled "A bill authorizing the construction, operation, and maintenance of a dam and incidental works in the main stream of the Colorado River at Bridge Canyon, together with certain appurtenant dams and canals, and for other purposes."

The bill will be inserted in the record at this point.

(The bill is as follows:)

[H. R. 934, 81st Cong., 1st sess.]

A BILL Authorizing the construction, operation, and maintenance of a dam and incidental works in the main stream of the Colorado River at Bridge Canyon, together with certain appurtenant dams and canals, and for other purposes

Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled, That for the purpose of controlling floods, improving navigation, and regulating the flow of the Colorado River, providing for storage and for the delivery of the stored waters to provide essential supplementary supply of water to irrigated lands, for municipal and domestic uses, and for the irrigation of public and other lands within the United States, and for the generation, use, and sale of electrical energy as a means of making the project herein authorized a self-supporting and financially solvent undertaking, and other beneficial purposes, the Secretary of the Interior, hereinafter referred to as the Secretary, subject to the terms of the Colorado River compact and the water-delivery contract between the United States and the State of Arizona, execued February 9, 1944, is hereby authorized to construct, operate, and maintain (1) a dam and incidental works in the main stream of the Colorado River at Bridge Canyon, which dam shall be constructed to an elevation of not less than one thousand eight hundred seventy-seven feet above sea level; (2) a related system of main conduits and canals, including a tunnel and main canal from the reservoir above the dam at Bridge Canyon to the Salt River above Granite Reef Dam, a canal from the Salt River to the Gila River above the town of Florence, Arizona, and thence a canal to Picacho Reservoir, and thence a canal to the Santa Cruz River flood plain; (3) such other canals, canal improvements, laterals, pumping plants, and drainage works as may be required to effectuate the purposes of this Act; (4) complete plants, transmission lines, and incidental structures suitable for the fullest economic development of electrical energy generated from water at the works constructed hereunder for use in the operation thereof and for sale in accordance with Federal reclamation laws (Act of June 17, 1902, 32 Stat. 338, and Acts amendatory thereof or supplementary thereto); and (5) such appurtenant dams

and incidental works, including interconnecting lines to effectuate coordination with other Federal projects, flood-protection works, desilting dams, or works above Bridge Canyon and a dam on the Gila River in New Mexico and such dams on the Gila River and its tributaries in Arizona as may be necessary in the opinion of the Secretary for the successful operation of the undertaking herein authorized and to effect exchanges of water to insure an adequate supplemental supply to lands presently or heretofore irrigated from the Gila River including and below Cliff Valley in New Mexico and from the tributaries of the Gila River by supplying water from the main stream of the Colorado River to lower lands now receiving water from the Gila River or its tributaries, thus releasing Gila River and tributary water for use and exchange on other lands served by the Gila River and tributaries and other exchanges of water which may be agreed upon by the users affected: *Provided, however,* That construction of the tunnel and that portion of the canal hereinabove described from the reservoir above the dam at Bridge Canyon to a junction with the aqueduct hereinafter authorized shall be deferred until Congress by making appropriation expressly therefor has determined that economic conditions justify its construction, and in order to provide a means of diversion of water from the Colorado River to the main canal pending the construction of said tunnel and said portion of the canal and for use thereafter as supplemental and stand-by works the Secretary is authorized to construct, maintain, and operate from appropriations authorized by this Act an aqueduct from Lake Havasu to and connecting with the main canal in the vicinity of Cunningham, Wash., and pumping plants to raise water from Lake Havasu to such elevation as may be required to provide gravity flow of such water to the main canal.

SEC. 2. The Secretary shall have the authority to acquire, by purchase, exchange, condemnation, or otherwise, all lands, rights-of-way, and other property necessary for said purposes: *Provided,* That, anything herein contained to the contrary notwithstanding, the Secretary shall not have the authority to condemn established water rights or the water to the use of which such rights are established, or works used or necessary for the storage and delivery of such water to the use of which rights are established, or the right to substitute or exchange water without the consent of the holders of rights or those entitled to the beneficial use of such waters as may be involved in the proposed exchange.

SEC. 3. The estimated cost of the construction of the said works shall be determined by the Secretary. The Secretary shall also determine (a) the parts of said estimated cost that can be properly allocated to flood control, silt control, navigation, river regulation, recreation, fish and wildlife conservation, general salinity control, respectively, and any other purposes served by the project which may hereafter be made nonreimbursable by law, the sums so allocated, together with the expenses of operation and maintenance attributed by him to such purposes, to be nonreimbursable, and (b) (1) the part of the estimated cost which can properly be allocated in irrigation and probably be returned to the United States in net revenues from the delivery of water for irrigation purposes; (2) the part of the estimated cost which can properly be allocated to irrigation and probably be returned to the United States by revenues derived from sources other than the delivery of water for irrigation purposes; (3) the part of the estimated cost which can properly be allocated to power and probably be returned to the United States in net power revenues; and (4) the part of the estimated cost which can properly be allocated to municipal water supply or other miscellaneous purposes and probably be returned to the United States.

Before any construction work is done or contracted for, the Secretary shall first determine that costs allocated to power, municipal water supply, irrigation, other miscellaneous purposes as herein provided will probably be returned to the United States: *Provided,* That the repayment period for costs so allocated shall be such reasonable period of years, not to exceed the useful life of the project, as may be determined by the Secretary.

SEC. 4. Electric energy developed at any of the generating plants herein authorized shall be used first for the operation of pumping plants and other facilities herein authorized, and for replacement purposes, and the remainder thereof sold or exchanged, to effectuate the purposes of this Act. In the production, sale, exchange, and distribution of electric energy generated by any of the works herein authorized in excess of that required for the operation of said pumping plants and other facilities, the Secretary shall be governed by the Federal reclamation laws. The Secretary is authorized to supply water for municipal and domestic purposes in accordance with the provisions of said laws.

SEC. 5. Contracts for the delivery of water for irrigation purposes shall provide for the delivery of such water at an identical price per acre-foot at the several points of delivery of water from the main canals and conduits herein authorized, and from such other points of delivery as the Secretary may designate. Such contracts shall be made with the State of Arizona or the State of New Mexico, or with persons, firms, public or private corporations, irrigation or other districts, municipal or other political subdivisions, thereof, in accordance with the reclamation law. No person shall have or be entitled to have the use for any purpose of any water delivered hereunder except by contract made as herein stated.

SEC. 6. The works provided for by the first section of this Act shall be used: First, for river regulation, improvement of navigation, and flood control; second, for irrigation and domestic uses and satisfaction of present perfected water rights; and third, for power. The title to all works herein authorized shall forever remain in the United States and the United States shall until otherwise provided by law control, manage, and operate the same: *Provided*, That the Secretary may in his discretion enter into arrangements for the operation or use of a unit or units of said works with the States of Arizona or New Mexico or any irrigation districts, reclamation project, or other subdivision or agency thereof.

SEC. 7. The rights of the United States in and to the waters of the Colorado River and its tributaries for the use of which the works herein authorized are incidental, convenient, or necessary as well as the rights of those claiming under the United States shall be subject to and controlled by the Colorado River compact.

SEC. 8. The United States in constructing, managing, and operating the works herein authorized, including the appropriation, delivery, and use of water for the generation of power, irrigation, or other uses, and all users of water thus delivered and all users and appropriators of water stored by said reservoirs or carried by said canals, including all permitees, licensees, and contractees of the United States, or any of its agencies, shall observe and be subject to and controlled, anything to the contrary herein notwithstanding, by the terms of the Colorado River compact and the water-delivery contract between the United States and the State of Arizona dated February 9, 1944, and by the laws of the State of Arizona or the State of New Mexico governing water rights wherever the same may be applicable.

SEC. 9. Nothing herein shall be construed as modifying or affecting any of the provisions of the treaty between the United States of America and the United Mexican States signed at Washington, District of Columbia, February 3, 1944, relating to the utilization of the waters of the Colorado River and other rivers as amended and supplemented by the protocol dated November 14, 1944, and the understanding recited in the Senate resolution of April 18, 1945, advising and consenting to ratification thereof.

SEC. 10. This Act shall be deemed a supplement to the reclamation law, which said reclamation law shall govern the construction, operation, and management of the works herein authorized except as otherwise herein provided.

SEC. 11. Nothing herein shall be contrued as interfering with such rights as the State of Arizona or any other State now has either to the waters within its borders or to adopt such policies and enact such laws as it may deem necessary with respect to the appropriation, control, and use of waters within its borders, except as modified by the Colorado River compact or any other interstate agreement.

SEC. 12. There are hereby authorized to be appropriated, out of any moneys in the Treasury not otherwise appropriated, such sums as may be necessary to carry out the provisions of this Act.

DEPARTMENT OF THE INTERIOR,
OFFICE OF THE SECRETARY,
Washington 25, D. C., March 29, 1949.

Hon. ANDREW L. SOMERS,
Chairman, Committee on Public Lands,
House of Representatives.

MY DEAR MR. SOMERS: This Department has been requested by the House Committee on Public Lands to report on H. R. 934, a bill authorizing the construction, operation, and maintenance of a dam and incidental works in the

main stream of the Colorado River at Bridge Canyon, together with certain appurtenant dams and canals, and for other purposes.

Some time ago this Department submitted to the President and the Congress its report on the central Arizona project. That report was, subject to certain conditions precedent therein enumerated, favorable. By letter dated February 4, the Director of the Bureau of the Budget advised me that he had been instructed by the President "to advise you * * * that he again recommends that measures be taken to bring about prompt settlement of the water rights controversy." In a subsequent letter, dated February 11, Mr. Pace explained that this advice was not to be taken as meaning that "the President * * * at any time indicated that suit in the Supreme Court is the only method of resolving the water-rights controversy which is acceptable to him" and that "If the Congress, as a matter of national policy, makes a determination that there is a water supply available for the central Arizona project, the President will consider all factors involved in any legislation to authorize the project and will inform the Congress of his views respecting the specific provisions of this legislation." Mr. Pace's letter of February 4 was published in the Congressional Record for February 7 at page A595. A copy of his letter of February 11 is attached.

Should the Congress, in the light of the very real need that exists in certain areas of Arizona for supplemental water for irrigation and of the urgent need for more power in the Southwest, determine upon the enactment of legislation along the lines of H. R. 934, then your committee may wish to consider the recommendations contained in paragraph 49 (8) of the report dated December 19, 1947, by the Bureau of Reclamation's regional director, region III. I urge your committee to consider also including, at an appropriate point in the bill, a provision affecting the Indians and reading along the following lines:

(*a*) In aid of the construction, operation, and maintenance of the works authorized by this act, there is hereby granted to the United States, subject to the provisions of this section, (i) all the right, title, and interest of the Indians in and to such tribal and allotted lands, including sites of agency and school buildings and related structures, as may be designated from time to time by the Secretary in order to provide for the construction, operation, or maintenance of said works and any facilities incidental thereto, or for the relocation or reconstruction of highways, railroads, and other properties affected by said works; and (ii) such easements, rights-of-way, or other interests in and to tribal and allotted Indian lands as may be designated from time to time by the Secretary in order to provide for the construction, operation, maintenance, relocation, or reconstruction of said works, facilities, and properties.

(*b*) As lands or interests in lands are designated from time to time under this section, the Secretary shall determine the just and equitable compensation to be made therefor. Such compensation may be in money, property, or other assets, including rights to electric energy developed at any of the generating plants herein authorized. In fixing such rights to electric energy, including the rates and other incidents thereof, the Secretary shall not be bound by section 4 of this act. The amounts of money determined as compensation hereunder for tribal lands shall be transferred in the Treasury of the United States from funds made available for the purposes of this act to the credit of the appropriate tribe pursuant to the provisions of the act of May 17, 1926 (44 Stat. 560). The amounts due individual allottees or their heirs or devisees shall be paid from funds made available for the purposes of this act to the superintendent of the appropriate Indian agency, or such other officer as shall be designated by the Secretary, for credit on the books of such agency to the accounts of the individuals concerned.

(c) Funds deposited to the credit of allottees, their heirs or devisees, may be used, in the discretion of the Secretary, for the acquisition of other lands and improvements or the construction or the relocation of existing improvements or the construction of new improvements on the lands so acquired for the individuals whose lands and improvements are acquired under the provisions of this section. Lands so acquired shall be held in the same status as those from which the funds were derived, and shall be nontaxable until otherwise provided by Congress.

(d) Whenever any Indian cemetery lands are required for the purposes of this act, the Secretary is authorized, in his discretion, in lieu of requiring payment therefor, to establish cemeteries on other lands that he may select and acquire for the purpose, and to remove bodies, markers and appurtenances to the new sites. All costs incurred in connection with any such relocation shall

be paid from moneys appropriated for the purposes of this act. All right, title and interest of the Indian in the lands within any cemetery so relocated shall terminate and the grant of title under this section take effect as of the date the Secretary authorizes the relocation. Sites of the relocated cemeteries shall be held in trust by the United States for the appropriate tribe, or family, as the case may be, and shall be nontaxable.

(e) The Secretary is hereby authorized to perform any and all acts and to prescribe such regulations as he may deem appropriate to carry out the provisions of this section.

(f) Nothing in this act shall be construed as, or have the effect of, subjecting Indian water rights to the laws of any State.

The Director of the Bureau of the Budget advised that there would be no objection to the presentation of an identical report to the Senate Committee on Interior and Insular Affairs regarding S. 75, an identical bill. A copy of Director Pace's letter of March 17 regarding that report is enclosed for your information.

Sincerely yours,

OSCAR L. CHAPMAN,
Under Secretary of the Interior.

EXECUTIVE OFFICE OF THE PRESIDENT,
BUREAU OF THE BUDGET,
February 11, 1949.

Hon. JOSEPH C. O'MAHONEY,
Chairman, Committee on Interior and Insular Affairs,
United States Senate, Washington 25, D. C.

MY DEAR SENATOR O'MAHONEY: Members of the Congress have raised a question as to the interpretation to be placed upon the last clause of the last sentence of my letter of February 4, 1949, addressed to the Secretary of the Interior advising him of the relationship to the program of the President of the central Arizona project. The clause referred to reads as follows: "* * * and that he (the President) again recommends that measures be taken to bring about prompt settlement of the water-rights controversy."

During the last Congress in connection with consideration of Senate Joint Resolution 145 and House Joint Resolution 227, this office advised the Attorney General that it would be in accord with the program of the President to resolve the water-rights controversy by waiving immunity of the United States to suit and by granting permission to the States to bring such actions as they might desire, if the Congress felt it to be necessary to take such action. This advice was transmitted to the Congress by the Attorney General. Similar advice was also transmitted by the Secretary of the Interior, together with specific suggestions as to a form of a resolution which the Congress might consider.

In order that there may be no misunderstanding of the President's position, I shall be grateful if you will advise the members of your committee that the President has not at any time indicated that suit in the Supreme Court is the only method of resolving the water-rights controversy which is acceptable to him. On the contrary, the letters addressed to the Congress last year, as indicated above, stated specifically that enactment of the resolution authorizing suit would be acceptable to the President. "* * * if the Congress feels that it is necessary to take such action in order to compose differences among the States with reference to the waters of the Colorado River * * *."

The prospect report and materials relating to the positions of the several States affected are now before your committee for consideration. If the Congress, as a matter of national policy, makes a determination that there is a water supply available for the central Arizona project, the President will consider all factors involved in any legislation to authorize the project and will inform the Congress of his views respecting the specific provisions of this legislation.

Sincerely yours,

(Signed) FRANK PACE, Jr.,
Director.

EXECUTIVE OFFICE OF THE PRESIDENT,
BUREAU OF THE BUDGET,
Washington 25, D. C., March 17, 1949.

The honorable the SECRETARY OF THE INTERIOR.

MY DEAR MR. SECRETARY: On February 19, 1949, you transmitted to me the report which the Department of the Interior proposes to make to the chairman

of the Senate Committee on Interior and Insular Affairs on S. 75, a bill authorizing the construction, operation, and maintenance of a dam and incidental works in the main stream of the Colorado River at Bridge Canyon, together with certain appurtenant dams and canals, and for other purposes.

The President has authorized me to inform you that there is no objection to the presentation of this report to Senator O'Mahoney. It will be appreciated if you will attach a copy of this letter when you forward your report to the committee.

Sincerely yours,

(Signed) FRANK PACE, Jr.,
Director.

Mr. MURDOCK. We vary a good deal in our committee procedure, while attempting always to keep within the rules of the House.

In view of the fact that we have here several witnesses from the West, who are businessmen and away from their businesses at an expense of time and money, I want to vary the program a little bit in starting off the hearings by using our out-of-town witnesses first.

If the committee will bear with me, I would like to make a little opening statement, as the author of the bill, and then the gentleman from California, Mr. Engle, would like to make a statement following that in order to get both sides of the matter in dispute outlined briefly for the beginning of consideration.

Then I think I shall call next on my colleague after my opening explanation before calling on the witnesses.

STATEMENT OF HON. JOHN R. MURDOCK, A REPRESENTATIVE IN CONGRESS FROM THE STATE OF ARIZONA

This is a simple bill and may be briefly and easily explained as follows:

It authorizes the construction of certain dams on the Colorado River and its tributaries, the chief multiple-purpose dam being at the Bridge Canyon site at the head of Lake Mead in northern Arizona. The other main features authorized by the legislation are: An aqueduct from the point of diversion eastwardly into the Phoenix area joining the river above Granite Reef Dam above Phoenix, and a continuation of the same into the central Gila Valley and further south to the Santa Cruz flood plain.

This authorization contemplates a temporary diversion from the Colorado River above Parker Dam, but ultimately a diversion by tunnel from the Bridge Canyon Dam, if and when economic conditions show the same to be feasible. The Parker diversion requires a pump lift which ought to be avoided, but it is recommended by engineers as being more easily and quickly built. The tunnel diversion would eliminate the pump lift and provide a gravity flow into the area to be served. The greater expense of the tunnel makes it wiser to defer, by a provision of this authorization measure, the establishment of the tunnel route for a date in the future when its feasibility can be more accurately gaged.

Generation of hydroelectric power is a necessary part of the plan. Some of this power is to be used for pumping and the major part of it to be marketed in a power-hungry area, and the resulting revenue, after repayment of investment, is to be used to aid in repayments of some irrigation costs.

This bill, like the Boulder Canyon Project Act of 1928 after which it is modeled, is based on the Colorado River compact of 1922, and H. R. 934 is supplemental to the Boulder Canyon Project Act of 1928, as it merely seeks to carry the original act another step forward. If there is anything constitutionally or legally wrong, or judicially unsound about the proposed bill, then the same thing is constitutionally and legally wrong and judicially unsound about the Boulder Canyon Project Act of 1928. They are on a par legally and rest upon the same basis. Both documents are in accord with the Colorado River compact and recognize the compact as their basic authority. Brilliant, legal authority on this committee has said that Congress cannot interpret an interstate compact, but nevertheless Congress did interpret a compact, the great compact of 1922, in its enactment of 1928, else how could the congressional enactment state that it is supplemental to and in conformity with the Colorado River compact? This bill makes the same provision.

It would be too bad if some of our legal authorities should prove that a congressional enactment cannot interpret an interstate compact, for that might nullify and destroy our first great enactment starting the development on the Colorado River. The enactment of 1928 was but one step by Congress in the river development intended to furnish the needed benefits to the State of California, and now 20 years later we come with H. R. 934 intended to be another step, designed to give much-needed benefits to Arizona. No more of an interpretation of the Santa Fe compact is necessary for this legislation than was needed for the legislation of 1928. The two measures are exactly on a par in legal foundation.

What may we expect by way of opposition to this measure? We are assured of the opposition of certain water agencies in southern California. We may identify those agencies in opposition as first in reality the Imperial irrigation district officers who, in my opinion, are leading the opposition basically, but not as openly as others, and second the metropolitan water district with its chief city, Los Angeles, which will be prominent in opposition, and over all certain State officials of the State of California who will try to make it appear that California is about to be injured by Arizona's action.

This whole complex matter is much clouded and jumbled, but we hope after our positive and affirmative presentation to furnish evidence in the hearings that the State of California, as a State government, has little real interest in opposing this legislation. Also, that the city of Los Angeles and the State of California are being used by selfish interests in southern California to conduct a fierce opposition against Arizona's rights in the Colorado River. In view of the great mass of misinformation emanating from the propagandists in southern California, it will require some time throughout the hearings to make these facts clear. However, that is a part of the task of the proponents of this bill.

As before stated, this bill aims to confer benefits upon Arizona which are rightfully hers and to work no harm upon any American State or community. The real purpose of this bill is not to enrich a few land monopolists, as California has seen fit to charge, but to rescue, stabilize, and conserve a great capital investment in Arizona which is now threatened, and at the same time to insure the economic

future of the State. This project is important to the Nation and has an international aspect. Our witnesses will show that this proposal is engineeringly sound and economically feasible.

Mr. Engle?

STATEMENT OF HON. CLAIR ENGLE, A REPRESENTATIVE IN CONGRESS FROM THE STATE OF CALIFORNIA

Mr. ENGLE. Mr. Chairman, I am very reluctant to find myself in disagreement with our distinguished chairman and with his colleague from Arizona, Mr. Patten, and with my distinguished friend, Senator McFarland, who is here with the committee in respect to this legislation.

The chairman has pointed up, I think, by implication at least, some of the disagreement which is implicit in this legislation.

I would like, Mr. Chairman, very briefly to outline to the committee what I consider to be the issues which this committee must face.

First is determining whether or not it should proceed on any extensive scale with a hearing of this legislation; and, secondly, with reference to whether or not a different procedure than that anticipated by the chairman should be followed, namely, whether or not we should determine certain basic legal questions first before we go into the question of the economic and engineering feasibility of this project.

I have given some attention, Mr. Chairman, to the Comprehensive Department Report on the Development of the Water Resources of the Colorado River Basin, published by the Department of the Interior in March of 1946. This, as I understand it, is the comprehensive report covering water development of the entire Colorado.

In that report, Mr. Warne makes the following statement, on page 3:

> There is not enough water available in the Colorado River system for full expansion of existing and authorized projects and for development of all potential projects outlined in the report, including those possibilities for exporting water to adjacent watersheds. The formulation of an ultimate plan of river development, therefore, will require selection from among the possibilities for expanding existing or authorized projects, as well as from among the potential new projects. Before such a selection for ultimate development can be made it will be necessary that, within the limits of the general allocation of water between upper-basin and lower-basin States set out in the Colorado River Co., the Colorado River Basin States agree on suballocations of water to the individual States.

This committee has just approved the division of water between and among the upper-basin States in the upper-basin compact.

On page 13 of the same report, there is the following language by Mr. Warne:

> There is not complete agreement among the States regarding the interpretation of the compact and its associated documents (the Boulder Canyon Project Act, the California Self-Limitation Act, and the several contracts between the Secretary of the Interior and individual States or agencies within the States for the delivery of water from Lake Mead). This report makes no attempt to interpret the Colorado River compact or any other acts or contracts relating to the allocation of Colorado River water among the States and among projects within the States.

I quote from that comprehensive report made in March of 1946 to indicate to the committee that there is a basic disagreement in regard to water and the allocation of water on the Colorado River.

It was contemplated that those disagreements should be settled in one fashion or another; that if all other projects which are contemplated or could be authorized were authorized, the water in the Colorado River would be oversubscribed.

I shall now go to the report on the central Arizona project forwarded to Congress, and I am reading from the letter of transmittal by Commissioner Michael W. Straus, under date of January 26, 1948, as follows:

Assurance of a water supply is an extremely important element of the plan yet to be resolved. The showing in the report of the availability of a substantial quantity of Colorado River water for diversion to central Arizona for irrigation and other purposes is based upon the assumption that claims of the State of Arizona to this water are valid. It should be noted, however, as the regional director points out, that the State of California challenges the validity of Arizona's claims.

I emphasize this statement:

If the contentions of California are correct, there will be no dependable water supply available from the Colorado River for this diversion. While water is physically available in the Colorado River at the present time, and is wasting to the sea, the importance of the questions raised by the divergent views and claims of the States is apparent. The Bureau of Reclamation and the Department of the Interior cannot authoritatively resolve this conflict. It can be resolved only by agreement among the States, court action, or by an agency having proper jurisdiction. It is assumed that the Congress, in considering this proposed project, will give this conflict the full consideration it deserves.

I again emphasize this statement:

The submission of this report—

This is the official report of the Bureau of Reclamation on this project—

is not intended in any way to prejudice full consideration of this controversial matter, nor should this report be construed as affecting the water rights of Indians and Indian reservations.

I go back to call the committee's attention again to the statement made by the Bureau of Reclamation that if the contentions of California are correct, there will be no dependable water supply available from the Colorado River for this project; and the further fact that the Commissioner states that they have not decided that question and their report is not to be considered as affecting that question one way or the other.

It is a fact, then, that the entire engineering, so far as the necessary water supply is concerned, as contained in the central Arizona project, is based on the assumption that Arizona's claims to the water necessary to serve the project are valid.

In other words, then, the Arizona project cannot be built unless it is definite and clear that Arizona has a legal right to use the water necessary to serve the project.

Here are the three major items of dispute between California and Arizona, and I will state them:

Whether the 3 (b) water in the compact—that refers to the basic Colorado compact—is apportioned and that, therefore, California has, by its limitation act, excluded itself therefrom?

Arizona will have to sustain its position on this point before it can legally use the water necessary to serve the central Arizona project.

The second question is whether Arizona is to be charged with the

amount of water that it actually uses and consumes from the Gila River and its tributaries, or whether it need only be charged with the amount that it depletes the virgin flow of the Gila River at its confluence with the Colorado River?

Arizona will have to sustain its position on this point before it can legally use the water necessary to serve the central Arizona project.

The third question is whether California, under its limitation act, is entitled to take its water from Lake Mead storage in a net quantity; that is to say, without being charged with evaporation or other losses occurring before it actually diverts the water?

Arizona will have to be successful on this point before it can legally use the water necessary to serve the central Arizona project.

In other words, then, Arizona will have to be sustained 100 percent in its contentions, and California will have to be overruled 100 percent in its contentions, before Arizona can legally use the water necessary to serve the central Arizona project.

Mr. CRAWFORD. Mr. Engle, who said that?

Mr. ENGLE. That is what I am saying; and I will follow it up and show you that other people are saying the same thing.

Mr. CRAWFORD. You are reading your statement?

Mr. ENGLE. That is correct. This is my statement.

California had a bill before the Congress last year seeking to have the controversy over the water supply in the lower basin of the Colorado put in the Supreme Court for a decision.

I now read from the hearings before subcommittee No. 4 of the Committee on the Judiciary, House of Representatives, Eightieth Congress, in the report of the Department of the Interior, under date of May 14, 1948, signed by Oscar L. Chapman, Acting Secretary of the Interior, wherein he states, on pages 24 and 25, as follows:

This is what you are asking about, Mr. Crawford. This is the statement of Oscar L. Chapman, reporting on the litigation bill before the Committee on the Judiciary.

He says this:

Confining my attention to this section of the Boulder Canyon Project Act—it being impossible to predict all of the issues that may be raised by the various parties to the proposed suit—four major problems would appear to be in dispute between California and Arizona. I may summarize them in question form thus:

(1) Are the 1,000,000 acre-feet of water for which provision is made in article III (b) of the Colorado River compact "surplus" or "apportioned" within the meaning of section 4 (a) of the Boulder Canyon Project Act? This is, is or is not California entitled to share in the use of III (b) water?

(2) Is the flow of the Gila River, for purposes of determining the water supply of the Colorado River Basin, to be measured at the mouth of the stream or elsewhere? And, as another aspect of the same problem: Is beneficial consumptive use by Arizona of the waters of the Gila to be measured in terms of diversions from the Gila River less returns to that river or in terms of the depletion of the virgin flow of that river at its mouth?

(3) Is the water required for delivery to Mexico under the treaty with that nation to be deducted from "surplus" water prior to determination of the amount available for use in California under section 4 (a) of the Boulder Canyon Project Act, or is California entitled to use a full one-half of the "surplus" diminished only by so much of the Mexican requirements as cannot be supplied from the other half?

(4) Is the burden of evaporation losses at such reservoirs as Lake Mead to be borne by California and Arizona in proportion to the waters stored there for each of them, or is the burden of these losses to be fixed in some other fashion?

The bare statement of these questions, the knowledge that there is disagree-

ment between Arizona and California about the answers to be given them, and the fact that, if the contentions of either State are accepted in full and if full development of the upper basin within the limits fixed by the Colorado River Compact is assumed—

I call that to the attention of all the gentlemen of the upper Colorado River Basin, because he puts it in—

if full development of the upper basin within the limits fixed by the Colorado River Compact is assumed, there is not available for use in the other State sufficient water for all the projects, Federal and local, which are already in existence or authorized, would seem to indicate that there exists a justiciable controversy between the States.

I quote also from page 26 as follows:

The water which California projects, Federal or other, now in existence or under construction will require when they are in full operation is a great deal more than the amount which that State is entitled to use if all of Arizona's contentions are taken to be true. Similarly, the water which Arizona projects now in existence, under construction, or authorized will require when they are fully developed is much more than the supply available to that State if all of California's contentions are taken to be true.

I also quote from page 26 as follows:

I have not attempted to examine the merits of the contentions made by the spokesmen for Arizona and California on these questions. Assuming, however, that there is some merit to both sides on all four of the major questions, it is obvious that there are many answers, in terms of the number of acre-feet of water which California may use under section 4 (a) of the Boulder Canyon Project Act that might conceivably be given. Using the long-run average flows shown in this Department's report on the Colorado River Basin as a basis for computations, the answers might range from as much as 6,250,000 acre-feet per year to approximately 4,000,000 acre-feet. Likewise, there is a great range in the amount of water from the Colorado River system which might be found available for use in Arizona. The maximum might be somewhat over 3,500,000 acre-feet, the minimum nearly as little as 2,250,000 acre-feet.

In other words, the central Arizona project, in the opinion of the Bureau of Reclamation, can only be built at the expense of California. That is, the water necessary to serve the central Arizona project must necessarily come out of the amount of water to which California, at this time, lays claim.

Now, Mr. Chairman, I present those as the legal questions before this committee to indicate to the committee that at the present time Arizona does not have any firm legal right to the water necessary for this project.

In my opinion it is not good judgment to go into a hearing on the economic and engineering feasibility of a project when we have not first determined that the water necessary for the use of that project has been established.

It would seem to me that the logical approach to this problem would be to determine whether or not Arizona or California is correct in its contention.

I expect, at a little later time, Mr. Chairman, to make a motion to postpone the consideration of the economic and engineering feasibility of this project until such time as there is a decision of the California-Arizona water rights controversy. I think that is an essential prerequisite to any consideration of the economic and engineering feasibility of this project.

I am not going to make that motion at this time because in deference

to the chairman and in deference to the fact that he has had witnesses come from great distances, we should hear those witnesses. I feel that the committee would probably take the same position.

However, Mr. Chairman, I want to address myself briefly, at least, to this proposition: Does this committee have any right or jurisdiction to undertake to determine the legal rights of California or the legal rights of Arizona?

Mr. CRAWFORD. Will the gentleman yield?

Mr. ENGLE. Yes, I yield.

Mr. CRAWFORD. Just a moment ago you referred to a decision to be made with reference to these rights. Who will make that decision?

Mr. ENGLE. The Supreme Court of the United States.

Mr. CRAWFORD. Has that case been instituted?

Mr. ENGLE. It has not and it cannot be instituted because the Supreme Court has ruled that the United States Government is a necessary party.

We have a bill pending in another committee of this House, the Judiciary Committee, to authorize a suit making the Federal Government a party to that litigation.

That legislation is now pending in another committee in this House. If that legislation is acted upon favorably by this Congress then this suit can be instituted.

There are only three ways in which States can determine controversy. One is by agreement. That is by compact such as we had here the other day and which was consented to by this committee and by Congress.

The second way is by arbitration, and the last way is by litigation.

California, in this instance, has offered to negotiate; California has offered to arbitrate; and California has offered to litigate; and Arizona has refused to do any one of the three.

Mr. LEMKE. When was that decision of the Supreme Court of the United States made?

Mr. ENGLE. The decision of the Supreme Court was in 1935.

Mr. LEMKE. It seems to me that that decision is erroneous. Under the compact it is the States who decide, or the court which decides the rights of the States under that compact. Uncle Sam has said, "That compact is okay, as far as I am concerned."

If I am any judge, that means that the question should be decided by the court as between the States.

However, if the Supreme Court ruled to the contrary, you are bound by it.

Mr. ENGLE. The Supreme Court, Mr. Lemke, has what we might say is the last guess. Anyway, the Supreme Court decided that the Federal Government is a necessary party because the Federal Government has gone into Boulder Canyon project and has built a huge project, and Federal interests and Federal property are therefore involved. For that reason, the Federal Government is a necessary party.

However, the question which I want to address myself to is whether or not this committee has any right to make a legal determination of water. If this committee decides that it has no power and no jurisdiction to decide the interpretation of the basic Colorado River compact, then that question must be decided before the engineering and

financial feasibility of the project should be considered by the committee.

It does not make good sense, does it, to spend weeks of our time hearing testimony from witnesses who come all the way from Arizona on the economic and financial feasibility of a project for which there is no water? That is utterly ridiculous, in my opinion.

Therefore, if this committee decides that it is going to undertake to decide that question, then we should go right back to the 1922 compact and try to determine what the States meant on an interpretation of that compact, to resolve the differences in interpretation between the respective States.

If we have not done that, we have not laid a proper foundation.

I will go one step further: I say that this committee has no jurisdiction. It has no power. This Congress has no jurisdiction and it has no power to interpret an interstate compact or to interpret an interstate contract, and that is what a compact is.

Therefore, the basic question which should be decided before the engineering and financial feasibility of this project is considered at all by this committee has to be settled in another forum. This Congress has no judicial power. No Congress under the Constitution has any judicial power. Congress cannot decide that California is wrong and that Arizona is right. Congress cannot take away any water from California. Congress cannot grant any water to Arizona.

The Federal Government does not own the water. There are 1,000,000 acre-feet of water in contention here. The Federal Government does not own that water. How, then, can the Federal Government give that water to Arizona and take it away from California?

Mr. LEMKE. Will you yield?

Mr. ENGLE. I yield; yes.

Mr. LEMKE. I think the gentleman is correct, with this exception: Congress can build all the dams it wants to, but they cannot decide where the water will go.

Mr. ENGLE. That is correct. When Congress builds the dams it allocates the water in accordance with the State water law. It is subject to the State sovereignty and jurisdiction. Only the judicial branch of our Government has the power to determine a conflict between the States.

The members of this committee are familiar with the plain language and intent of the Constitution, where it says in section 1, article I:

> All legislative powers herein granted shall be vested in a Congress of the United States, which shall consist of a Senate and House of Representatives.

And where it says, in section 1, article II:

> The executive power shall be vested in a President of the United States of America.

And where it says, in section 1, article III:

> The judicial power of the United States shall be vested in one Supreme Court, and such inferior courts as the Congress may from time to time ordain and establish.

And where it says, in section 2, article III:

> The judicial power shall extend to all cases, in law and equity, arising under this Constitution, the laws of the United States, and treaties made * * *; to controversies between two or more States * * *.

91190—49—ser. 11, pt. 1——2

That is this kind of a controversy.

The members of this committee are familiar with section 233 of the Judicial Code of the United States, which has been in existence since 1787 and is now found in title 28, section 341, of the United States Code, Annotated, where the Supreme Court is given exclusive jurisdiction "of all controversies of a civil nature where a State is a party."

If the Supreme court is given exclusive jurisdiction, then no other agency, of course, can have such jurisdiction.

We know, therefore, that there is only one tribunal which has constitutional power to determine an interstate controversy of the character we have before us. True, there are other ways of settling a controversy other than by litigation, but I know only of two. One is for the parties to sit down across the table and give and take until a settlement is reached; and the other is for the parties to agree to submit their differences to arbitration and agree to be bound by what the arbitrators say.

Other than litigation, those are the only methods of settling a dispute, whether it be between two men, two corporations, or two States.

As I have said, California has agreed to negotiate; California has agreed to arbitrate; and California has agreed to litigate; but Arizona has refused to do all those three.

Mr. Chairman, you yourself have admitted that there is a serious controversy between Arizona and California.

I quote from the record before a former Irrigation and Reclamation Subcommittee of the House Committee on Public Lands, of which you were the chairman. We were considering at that time the authorization of the Gila project, and the record of these proceedings shows that on July 11, 1946, the chairman stated:

> To my personal knowledge, there has been effort made to get Arizona and California to get together for a quarter of a century, ever since 1923, certainly since 1927, and more certainly since the Boulder Canyon Project Act was passed. Somebody, some place, has held up the agreement.

On that same day, and in that same hearing, Mr. Charles A. Carson, the special attorney for the State of Arizona on Colorado River matters, who appeared before this committee in connection with the upper Colorado compact, was answering questions propounded by Congressman John Phillips, and this question and this answer appear on page 521:

> Now, I would just like to ask Mr. Carson in very simple language: Do I understand now that Arizona refuses to arbitrate?
> Mr. CARSON. Yes, sir; you can understand that.

So we find that a settlement by agreement and a settlement by arbitration is not possible. Therefore, nothing remains but to have litigation, and that litigation can go to and be decided only by the United States Supreme Court.

There is one other matter. I call the attention of the committee to the fact that we have already passed on this question; at least, it has been settled so far as this committee and this House is concerned.

On July 14, 1947, the House Committee on Public Lands reported on H. R. 1597, being a bill to authorize the Gila project. That report is Report No. 910 of the committee, and after authorizing the project the committee report made the following statement, which I will read.

This is the statement, Mr. Chairman, of the Committee on Irrigation and Reclamation of this House in reporting on the Gila project. I quote:

> It is the intent of the committee that nothing in this bill is to be construed as affecting the rights of the States of Arizona or California as to the use of the amount of water in the lower Colorado River Basin, that each State is entitled to under the existing compact, contracts, or law. The committee feels the the dispute between these two States on the lower Colorado River Basin should be determined and settled by agreement between the two States or by court decision because the dispute between these two States jeopardizes and will delay the possibility of prompt development of any further projects for the diversion of water from the main stream of the Colorado River in the lower Colorado River Basin.
>
> Therefore, the committee recommend that immediate settlement of this dispute by compact or arbitration be made, or that the Attorney General of the United States promptly institute an action in the United States Supreme Cour against the States of the lower basin, and other necessary parties, requiring them to assert and have determined their claims and rights to the use of the waters of the Colorado River system available for use in the lower Colorado River Basin.

In other words, Mr. Chairman, as I read the report of the committee in that instance, it made a specific direction in respect to this problem. It specifically refused to go into the matter or to undertake to determine the respective rights under that interstate contract, but directed that it should be done by agreement or by decision in the Supreme Court.

I think another very important matter is involved here. If we should attempt to authorize this project, we would be making a congressional determination of the question of water rights. It has been the policy of the United States Congress from the beginning to recognize that the control of the uses of water is vested in the States and that differences between the States with respect to the uses of water should be settled preferably by compact; but if agreement is not possible, then by litigation.

This proposal before us would be a reversal of that policy. A century of development of water law would be upset. State sovereignty over the rights to the use of water would be destroyed.

We are asked to determine a question of water rights by this legislation. We have no constitutional power to do it. We are violating both Federal precedent and policy to do it; and it is, therefore, beyond our jurisdiction even to consider doing it.

I may go just a little further in that respect and call the attention of my colleagues from the upper Colorado Basin to this situation: If this committee undertakes to make a political decision of the water rights of the lower Colorado River, what reason do you have to suppose that that will not be a precedent for the determination of the utilization of water in the upper Colorado River States?

In other words, let us make this assumption: Let us assume that the Congress authorizes this project and that after this project is authorized at an initial cost of some $750,000,000—with a total cost, including lost interest, of the sum of $1,400,000,000—and all of these vast developments are put in place, and California, as has already been stated in the statement submitted by the Bureau of Reclamation, now has projects either under construction or authorized to use all of this water, then what is going to happen in the upper basin in the event that the authorization of projects in the upper basin will require us

to leave one or another of those projects in California or Arizona high and dry some 10 or 20 years from now?

Mr. WELCH. Will my colleague from California yield?

Mr. ENGLE. I yield.

Mr. WELCH. Will you please tell the committee just what you mean by the statement with reference to the committee making a "political decision" with respect to this matter?

Mr. ENGLE. I mean by that this, Mr. Chairman: That if the committee makes a decision based upon what we might say is the representation from the various States on this problem, then you have what I call a political decision. It is not a decision in the courts. It is a legislative decision. Perhaps it more properly could be called a legislative decision, in the legislative branch of the Government.

There is another thing that I am calling the attention of my colleagues to.

Mr. WELCH. It is an economic question; not a political question, as I see it.

Mr. ENGLE. It is a political or legislative decision, when you decide and interpret a contract here in Congress.

The point I want to make to my friends up in the upper basin States is this: That in the event the situation should occur which I have described, do you have any reason to suppose that there will not be a similar political or legislative decision made with reference to the authorization of projects in the upper basin States which would leave, as I say, one or another of these million dollar projects high and dry, maybe 10 or 20 years from now, when the upper Colorado starts to use some of its water?

Mr. LEMKE. Will the gentleman yield?

Mr. ENGLE. Yes.

Mr. LEMKE. Just for an inquiry.

Do I state this correctly: Your position is that if we make a legislative decision that is contrary to the final interpretation of the contract by the court, our mistake will be corrected by the court although it may cost the Government considerable money?

Mr. ENGLE. No; I am not saying that.

What I am saying is that if we establish a precedent of making a political and legislative decision on matters involving the interpretation of an interstate contract, then every project that comes up on the Colorado River will be subject to the same kind of treatment.

Ten years from now, when California has 30 Congressmen instead of 23; or 20 years from now, when California has 40 Congressmen instead of 23——

Mr. LEMKE. May I make an observation?

Mr. ENGLE. Yes.

Mr. LEMKE. I do not agree with you if you mean that we can make a decision contrary to law and that that will be a precedent, because we cannot change the compact, except as interpreted finally by the court.

Mr. ENGLE. I am in hopes that this committee will not make that decision. I do not think it is proper for this committee to make that decision.

Now, Mr. Chairman, I want to summarize very briefly.

In summary I want to say this: That there is no water for this

project, nor is there sufficient water, if California is correct, in any one of its contentions. In other words, we are undertaking to give consideration before this committee to the economic and financial feasibility of a project for which there is no water, if California's contentions are correct.

Second, it is not sound to hear the economic and engineering feasibility questions involved in this project until the water question is determined, because we are talking about a project that may never exist.

Third, does this committee wish to go into that problem? That is, the problem of water rights involved in this legislation. Or would they rather leave it to the Supreme Court, where it belongs?

The determination of that question is a condition precedent to a proper consideration of this legislation.

Fourth, if the committee decides to go into the water issue, the committee should then hear first those issues and determine those issues before going into the questions of engineering and financial feasibility.

In such instance California should be given a full opportunity to get its witnesses back here to be heard with respect to the interpretation of this basic compact, upon which they predicate their water rights.

Fifth, and last, if the committee decides to undertake to determine this water question, and if the committee finds after a full hearing on the question that Arizona does have the water, then and only then will it be proper for the committee, in my opinion, to proceed with the hearing of witnesses on the question of economic and engineering feasibility.

Now, Mr. Chairman, I have said that at a little later time I intend to make a motion to defer the consideration of this project until the basic water problem is settled.

In my opinion, this committee has three questions to answer, and they must all be answered in the affirmative before it can put out this bill.

No. 1 is that the committee has to determine whether or not it will take jurisdiction, I might say, of the water question involved in this legislation. The committee should decide as No. 1, whether or not it has any right or jurisdiction to pass upon and to endeavor to interpret the basic documents in the Colorado River.

Secondly, if the committee determines that it does have such jurisdiction and that it is proper for this committee to determine the respective rights under the interstate contract, then the committee should hear the witnesses on the water issue first and determine the existence of the water before the committee undertakes to determine the questions of whether or not the project is economically and engineeringly feasible.

The third question the committee has to answer is whether or not this project, which will cost more than all reclamation has cost in its history—some $1,400,000,000, after it is put into full operation—whether or not that project is a proper project and is financially feasible and feasible from an engineering standpoint.

Mr. Chairman, those are the three basic questions which I intend to continue to submit to this committee with due deference to the chairman and his people who have come from a long distance to testify.

I will propose a motion which will put the issue before this committee, the basic question of whether or not this committee desires to

take jurisdiction or has any jurisdiction to determine and to interpret an interstate contract.

Mr. WELCH. Mr. Chairman, I ask to be excused at this time.

There is another phase of California's water and power pending before the House at this time. It is the appropriation bill for the Department of the Interior. Some of us are vitally concerned as to whether the benefits to be derived from public power in the great Central Valley will be enjoyed by the power users and irrigationists and farmers, or whether it will be enjoyed by the large power interests. I would like to be on the floor.

Mr. MURDOCK. Yes. We are sorry to have you go, Congressman Welch, but we understand the importance of that issue, also.

I think the issues now are outlined. As I said to my friend, Congressman Engle:

"I want to make a brief opening statement by way of explanation. I think you want to make a brief opening statement by way of explanation; so that we will get the matter before the committee."

Mr. ENGLE. My statement was not so brief, Mr. Chairman.

Mr. MURDOCK. The argument that the Congressman from California has given us is strangely reminiscent.

I intended to bring—but I forgot to bring—a stack of Government publications printed during the past 3 years, totaling about 5,000 printed pages, in 6-, 8-, and 10-point type, where all of these matters have been presented at great length.

They were presented before the Committee on Irrigation and Reclamation in 1946, again in 1947, and yet a bill was reported out unanimously by this committee and passed by the House unanimously, in the face of the arguments that we have heard.

Mr. POULSON. Mr. Chairman, the arguments through all those thousands of pages did bring out the fact that there was a basic dispute over the interpretation of the contract, which was a legal dispute.

Mr. ENGLE. Mr. Chairman, I might comment on that to say this: California had no objection to the Gila project, provided it was clearly understood that Arizona was making its choice and that the determination of the basic water-rights question would be settled.

The committee in its report, and I read the excerpt from the report——

Mr. MURDOCK. As for any assumed choice by Arizona on the Gila project, more will be said later. We have the official report to follow, also, in the record.

Mr. ENGLE. I think the language I have conforms, Mr. Chairman. If it does not it is supposed to.

I would like to ask our chairman a question, if you will yield to a question. It is just one brief question.

Mr. MURDOCK. All right.

Mr. ENGLE. Is it your opinion that this committee or that this Congress has the power to interpret an interstate compact or contract?

Mr. MURDOCK. This committee did interpret an interstate compact in 1928 and reported out the Boulder Canyon Project Act, and Congress passed it.

Mr. ENGLE. Mr. Chairman, I recall Mr. Breitenstein testifying specifically in answer to my question in the hearings on the upper Colorado River that Congress had no such power.

I asked him specifically: "In your opinion, does the Congress have the authority or the power to interpret such interstate compact?" and Mr. Breitenstein said, "No, sir."

It was agreed in the hearings on the upper Colorado River compact that Congress had no such power. It was written into the report.

The report issued by this committee says in just so many words that the Congress is not interpreting the basic compact, and Mr. Breitenstein, who appeared for the upper Colorado people, was so concerned about it that he would not consent to writing language in the bill saying that Congress did not by its consent to the compact, interpret the basic Colorado River compact.

When I asked him why he said that if you put such language in it might imply that such power did exist in the absence of such language.

That is the time, Mr. Chairman, when you will recall I asked him if I handed him a note saying that I did not intend to kick his dog, that I thereby implied that I would kick his dog in the absence of such a note; and he said he thought maybe his dog had been kicked first, because of some language in the Boulder Canyon Project Act.

However, he specifically denied that the Boulder Canyon Project Act was an interpretation of the basic Colorado River compact.

Mr. MURDOCK. Senator McFarland has kindly come over to our hearing. I believe the Senate is meeting at 11 o'clock today, also. I rather wanted the Senator to give the outline of this.

We cannot, in one short session, which has to be a short session, argue this matter. I think the issue is at last outlined. It has been joined in the minds of a few of us for a long time.

I note that my colleague, Congressman Patten is here.

Have you a word, Congressman Patten?

STATEMENT OF HON. HAROLD A. PATTEN, A REPRESENTATIVE IN CONGRESS FROM THE STATE OF ARIZONA

Mr. PATTEN. Yes, Mr. Chairman and members of the commitee. I appreciate being here, and will submit a written report in the future.

I am pleased to sponsor this bill, or to be allowed to do so with your worthy chairman, because not only is it necessary for Arizona, but I am sure it is right and just.

As the committee listens to the witnesses I am sure they will be convinced by the facts that is the case.

I now ask permission of the committee to file a statement which I have prepared on this question.

(The statement is as follows:)

STATEMENT BY HON. HAROLD A. PATTEN, MEMBER OF CONGRESS, ARIZONA, BEFORE THE HOUSE PUBLIC LANDS COMMITTEE, REGARDING H. R. 934 AND H. R. 935

On the first day of the present hearings permission was most kindly granted me for the submission of somewhat amplified remarks, in addition to the very brief statement made by me at that time.

I am well aware that the numerous engineering, legal, financial, and technical details related to the central Arizona project, as proposed in House bills 934 and 935, either have been or will be amply presented to the committee by individuals expert in those fields; I, therefore, will refrain from amplification of those aspects of the case.

At the risk of being deemed completely ingenuous, I should like to say that I

am convinced that this committee and the Members of Congress are going to concentrate their attention upon the central and essential elements of right and justice in this matter, and that they will thus cast aside the many specious and technical arguments, however skillfully advanced, which are being raised by the opponents of the proposed legislation. Looking at the case in this fashion, it is clear that Arizona desperately requires her share of the waters of the Colorado River, and that she requires them now, today, to preserve her own civilization and her own way of life in the sisterhood of the various States. It is preposterous to assume that in the division of the Colorado system waters available to the lower-basin States it was ever intended or agreed that Arizona should be forced to content herself with little more than the waters of the Gila River, all of which had theretofore been appropriated and put to use within the boundaries of my State. Conversely, it is equally obvious that the division was intended to be, should, and must be, made upon a basis giving Arizona a substantial quantity of the waters of the main stream of the Colorado.

California, by her own legislative action, has limited herself to a maximum of 4,400,000 acre-feet per year of the waters of the main stream which were apportioned by article III (a) of the compact, plus one-half of any excess or surplus that might exist. That is the lion's share of a very large lion. Without laboring the point further and without engaging in any extended mathematical computations, I think it plain that Arizona is entitled to sufficient water from the main stream of the Colorado River to supply the central Arizona project, namely, 1,200,000 acre-feet, and that this would be the conclusion of any impartial group who would examine the case, either superficially or in the most minute detail.

I can see no justification in common sense for, nor does the law uphold the argument advanced by our opponents which seeks to obtain action favorable to California upon the basis that California's need is a greater need than the need of Arizona. However, because California has devoted, and is continuing to exert, great attention to the proposition that she is in some dire, urgent, and present necessity, I feel it proper if only in the interest of a dispassionate appraisal of the facts to point out that California is in truth in no such need, and that she is not likely ever to be in such need if she will merely refrain from the doing of a palpably unwise act. It is entirely within her power to refrain from such an act, and is to her distinct advantage as a State, and will occasion her no substantial (if any) losses.

I refer to California's avowed intention to transport waters of the Colorado River to the east and west mesas of the Imperial Valley, where she proposes in future to develop huge irrigation projects.

On the basis of conceded or undisputed facts, California finds herself in a somewhat rare circumstance. On the afternoon of April 6, the distinguished counsel for the metropolitan water district, Mr. James H. Howard, was testifying before a subcommittee of the Judiciary Committee of this House; and the chairman of the subcommittee, by a series of questions, drew from Mr. Howard the admission that the contemplated requirements for additional water to be used by the metropolitan water district for municipal purposes in the city of Los Angeles and the other large urban areas along the coast of that region, would not develop beyond the supply for which it has a present contractual right, until a time some 60 years hereafter.

California has elsewhere admitted (during the hearing on Senate bill 1175, see p. 377) that the present total annual use by California of the Colorado River water is approximately 3,000,000 acre-feet. California also admits that she intends to develop and to place under irrigation a total of some 300,000 acres in the areas which I have mentioned as being within the east and west mesas of the Imperial Valley. They have not denied, and they cannot deny, that if these 300,000 acres are not placed under cultivation California will have, in ample degree, all the water of the Colorado River which she is likely to need.

The Bureau of Reclamation in concert with the University of California and the United States Department of Agriculture has been conducting a detailed study of the two mesas. The Bureau has already formulated and filed its report on the Imperial east mesa, which report is entitled "Land Classification and Development Report, Imperial East Mesa, All-American Canal Project, California." The report is a thorough treatment of the subject, and it appears to be well documented and substantiated. The Bureau has likewise prepared a report concerning the ability of the east mesa to repay the cost of California's proposal for the development thereof. That report, I believe, is entitled, "Report

of Repayment Ability, Imperial East Mesa, All-American Canal Project, California."

I do not pretend to have made an exhaustive personal study of these reports, but I do wish to present their essence in a summarized manner.

In a letter whereby the regional director transmitted the land classification and development report to the Commissioner of the Bureau of Reclamation the following language appears:

"2. The report shows that of 225,300 acres covered in the survey, only 35,900 acres or 16 percent were classified as irrigable. Most of this acreage (30,550) is class 3, and the remaining acreage (5,350) is class 2. The class 2 and 3 lands are scattered throughout the east mesa. Only 18,612 acres of irrigable land are so grouped that they could be included in the seven potential areas considered most feasible of development. The remainder of the class 2 and 3 lands, 17,288 acres, is considered, from an economic standpoint, to be beyond the reach of a distribution system."

It also follows, that the balance of these lands on the east mesa, an area of some 189,400 acres, are not irrigable, and they were so classified in the report. The report also points out that due to the circumstance that the irrigable lands are scattered here and there, the cost of irrigation is extraordinarily high, so high as would appear to render irrigation unfeasible.

The lands on the west mesa are reported to be inferior to those of the east; however, assuming that the lands are generally equal, and applying the finding that 16 percent of such east mesa lands are irrigable, it follows that there would be on the west mesa some 12,000 irrigable acres. The net result is that of the total area on both mesas, more than 250,000 of the 300,000 acres are nonirrigable whereas only some 48,000 are susceptible of irrigation. Assuming a water need of 6 acre-feet per acre, the application of this water requirement to the 48,000 irrigible acres indicates a requirement of 288,000 acre-feet of water per year. Add 3,000,000 acre-feet of the maximum use which California has thus far made annually of the Colorado River to the 288,000 acre-feet which would be required at some indefinite future time if California persists in her plan to irrigate the east and west mesas, and you have a total of 3,288,000 acre-feet. The difference between that quantity and the 4,400,000 acre-feet to which California has limited herself leaves approximately 1,112,000 acre-feet to be applied to other future requirements, apart from any share of excess or surplus waters which might be deliverable to California; which makes it manifest that California will have ample water to cover any losses or diminutions which she would have to stand, including losses from evaporation.

The foregoing remarks are based upon the favorable position California takes for itself. I do not at all concede that California has an absolute right in any event to 4,400,000 acre-feet per year of the IIIa water; that quantity appears to me to be just what the California statute says; that is, a limitation to a maximum of 4,400,000 acre-feet.

I think the committee will recall that Senator McFarland pointed out that the amount of Colorado River water wasting into the Salton Sea from Imperial Valley irrigation activities is some 1,074,150 acre-feet per year according to information furnished by the Bureau of Reclamation. Certainly, California will make a serious effort to avoid this extravagant waste, and although I am no engineer, I am of the opinion that at least half of this loss can and should be averted. If so, she will have more than a million acre-feet of water in which to increase her uses and to offset losses and depreciations such as evaporation and the like. I offer the following excerpts taken from the report of repayment ability, bearing date of March 1948:

"This report presents an analysis of the repayment capacity of lands classified as irrigable within seven potential development units on the Imperial east mesa division of the All-American Canal project in California. Irrigation water would be supplied from the Colorado River and delivered through the All-American and Coachella Canals. Of the 33,872 acres in the potential units 32,440 acres are publicly owned lands withdrawn from entry. A complete discussion of the land classification of the area and anticipated farming problems is given in the east mesa land classification and development report, dated April 1947. This report shows that 18,612 acres of the 33,872 acres in the potential units have been classified as irrigible; 3,782 acres are class 2 and 14,830 acres class 3" (p. 1).

"Project development costs are estimated to average $615 an acre, which includes $390 for a distribution system and $225 for predeveloping the lands" (p. 1).

"On the basis of a budget analysis it has been shown that class 3 lands would not be able to pay for the cost of constructing a distribution system" (p. 2).

"However, the class 2 lands are so interspersed with class 3 and 6 lands that their separate development would be physically impractical. If all 80-acre tracts of predominately class 2 and 3 lands were developed, it is estimated that less than 20 percent of the total construction and predevelopment cost would be recoverable from the settlers" (p. 2).

"This classification shows a total of 35,900 acres of class 2 and 3 lands, of which 18,612 acres are located within seven potential development areas. Most of the lands tentatively classified as irrigable are of marginal character, and were designated as class 3. The class 2 and 3 lands not located within the development areas represent isolated tracts scattered throughout the mesa, which could not be served by a distribution system without the inclusion of a large acreage of class 6, nonirrigable land." (Last paragraph, p. 3.)

"It appears likely that the irrigation of any substantial acreage of the mesa lands would tend to enhance seriously the drainage difficulties in Imperial Valley unless additional drainage facilities are constructed" (p. 4).

"Most of the mesa is publicly owned land under reclamation withdrawal. Of the 33,872 acres in the potential units, 32,440 acres are publicly owned lands, withdrawn from entry. There are 1,219 acres of privately owned lands located within unit 1; 84 acres of State land; and 129 acres owned by the Southern Pacific Co." (Last paragraph, p. 4.)

On March 28, 1949, the Secretary of the Interior announced that the irrigation development of public lands on the east mesa would be inimical to the public interest; and in a letter written to the president of the board of directors of the Imperial Irrigation District at about the same time, the Secretary among other things states that he is compelled to advise the district that he does not contemplate that any public lands on the east mesa will be open to reclamation, homestead entry and settlement, and that he therefore could not approve the construction of canal turn-outs designed to serve these lands. Whether certain interested persons in California will stubbornly persist in their efforts to place the lands of the east and west mesas under cultivation, is a matter which remains to be seen; however, there can be no doubt that the continuation of such efforts is an unwise thing. Certainly California should not be heard to cry forth her urgent need for water if this is the sort of project which is to be included in the substantiation of her supposed necessity.

I think I might repeat that the report specifically stated that "of the 33,872 acres in the potential units" of the Imperial east mesa "32,440 acres are publicly owned lands withdrawn from entry."

I am in no position to state that all of California's claims are as spurious as her claim that she now needs and must have practically all of the water flowing in the Colorado River below Lee Ferry, except that which may be required to meet the Mexican requirements under the international treaty; but these simple facts of the case certainly should deflate the ever-ballooning claim of the California propagandists and apologists that their State is presently drawing upon what they are pleased to call their last water hole and that the great civilization of the Golden Empire is about to wither and blow away. Has the Los Angeles Chamber of Commerce heard about this?

Mr. MURDOCK. Senator McFarland, will you enlighten us further?

STATEMENT OF HON. ERNEST W. McFARLAND, A UNITED STATES SENATOR FROM THE STATE OF ARIZONA

Senator MCFARLAND. Thank you, Mr. Chairman.

Mr. MURDOCK. This is only with a view to opening up the matter so that we can get the whole matter before the committee.

We do expect to bring the whole matter before the committee; and, naturally, only one side of it—and not the Arizona side of—has ever been presented to this committee or to this House. That is the thing we want to see; that both sides are fully presented.

Senator MCFARLAND. Mr. Chairman and members of the committee, I wish to thank you for the privilege of coming before you and explaining some of the things that have taken place before our committees in the Senate, and giving you a summary of the evidence.

If I may, Mr. Chairman, I would like to submit my prepared statement to you without reading it in full, because it is rather lengthy. The statement contains a summary of the evidence. In the Senate we had hearings on S. 1175, which is the antecessor of, and practically the same as S. 75. S. 75 is identical with House bills 934 and 935, which you are considering here this morning.

I want to say to you in the first place, though, that I appreciate appearing before a committee of which my good friend, Congressman Engle, is a member. He and I have fought a lot of battles together and before we have always been on the same side. I hope before this is over that he will see the error of his ways and will come over on the right side and be with Arizona.

I want to say to the Congressman, though, before I start on this summary that he mentioned here this morning that there had been authorizations for projects in California, most of which had been constructed. Did you gentlemen ever hear of California asking for litigation before they asked for one single one of those projects to be authorized by Congress? If you did, you have heard more than I have. No one ever heard of California asking for litigation until Arizona comes in and wants a little of this water.

I want to explain that in a little more detail, later.

(The prepared statement of Senator McFarland is as follows:

STATEMENT OF SENATOR ERNEST W. MCFARLAND IN SUPPORT OF HOUSE BILLS 934 AND 935

Mr. Chairman and members of the committee, experience has convinced me that my own understanding of measures before the Senate is greatly increased if I may have the benefit of the history and course of the companion bills in the House. With the thought that you gentlemen may derive a fuller understanding of the central Arizona project, as the same is reflected in the bills now in hearing, if you were apprised not only of the general factual background and purpose of the project, but if you also were acquainted with the relevant developments in the Senate, I shall attempt to state the case as it has there been presented.

As you doubtless know, the Senate Committee on Interior and Insular Affairs now has under consideration S. 75, which is a bill identical with House bills 934 and 935. S. 75 is, with a few minor changes, the same as S. 1175, which was filed during the Eightieth Congress and upon which full hearings were held in the Senate during the term of that Congress. Such hearings were printed and you doubtless have copies thereof.

It is clear at this point that the testimony for and against S. 75 is generally equivalent to that introduced in connection with S. 1175, and likely the equivalent of the testimony which will be here adduced.

Therefore, as a prologue and perspective of the case, I desire to summarize, first, the provisions and purposes of S. 75 and House bills 934 and 935 and, second, the evidence which has been hitherto taken in support of S. 75 and of its antecessor, thereby accomplishing the parallel purposes as to House bills 934 and 935.

Final action was not taken on S. 1175 for the reason that the report of the Department of the Interior on the central Arizona project had not become final at the time of the hearings and did not become final until September 16, 1948. In general and fundamental support of House bills 934 and 935, I wish now to introduce that report as an integral part of the evidence which is offered by the proponents of the bills.

I also desire now to offer in evidence, by reference, those portions of the testimony offered by the proponents of S. 1175 and by officials of the Bureau of Reclamation during the hearings on S. 1175 in June and July of 1947, as the same has been printed in the report of said hearings. My references at this time will be to the foregoing sources, for convenience and certainty.

S. 75, which was introduced by Senator Hayden and myself, is a bill to authorize the construction, operation, and maintenance of a dam and incidental works in the main stream of the Colorado River at Bridge Canyon, together with appurtenant dams and canals for the purpose of providing supplemental water

for lands now being irrigated in central Arizona. House bills 934 and 935 have the identical purposes.

The amount of land which would receive supplemental water under these bills is estimated in the report of the Secretary of the Interior to be approximately 639,680 acres (table B-23 of report). Other persons estimate this acreage to be approximately 725,000 (see testimony of W. W. Lane, pp. 218–219 of the hearings on S. 1175).

However, as may be plainly deduced from all the testimony, the bills would attain many other desirable objectives, direct and indirect, of incalculable value.

The provisions and objectives of the bills are best understood if considered against the background of the long and toilsome battle Arizonians have waged to reclaim desert land and to convert it through the magic of irrigation to productive abundance. To preserve and maintain the rewards of this monumental struggle, we now are in mortal necessity of a supply of water wherewith to supplement such inadequate stores as nature and terrain have made available, which stores are depleted to an extremely critical point. (Note testimony of Mr. E. A. Moritz, for example, on p. 31 of said hearings).

Our only source for self-preservation is the waters of the Colorado River, which can best be obtained for the major area of our developed lands by raising those waters to an altitude sufficient to permit them to flow naturally to points of need, whence they may be used directly or in exchange for waters now derived by inflow from higher regions, thereby releasing the latter for use in such higher regions.

S. 75 and House bills 934 and 935 propose to authorize a project to deliver these life-sustaining waters to the people of Arizona.

They will do so under a plan engineeringly feasible and financially self-liquidating, which will preserve a great and sturdy American community that will continue to be an invaluable fountain of strength and revenue for its own and our Nation's security.

The bills provide for a dam at Bridge Canyon on the Colorado River in northwestern Arizona, and for a tunnel and main canal to transport water from the reservoir impounder by that dam in a general southeasterly direction to the Salt River above the presently existing Granite Reef Dam. From there a canal would be built to the Gila River above the town of Florence, Ariz., whence a canal would be constructed to the Picacho Reservoir and thence to the flood plains of the Santa Cruz River. Appurtenant to these would be a related system of conduits and canals to distribute water to lands in Maricopa and Pinal Counties. The delivery of water to these areas will satisfy the demands there, consequently affording a greater supply of the waters of the Salt and Gila Rivers to higher areas along their courses and on all their tributaries within Arizona, such as Duncan and Safford. Relief will also extend to areas along the Gila in New Mexico, and will augment municipal supplies, as in the case of Tucson, Ariz.

You will note that the boring of the tunnel will be deferred until Congress determines that economic conditions so justify. In the meantime, a hydroelectric generating plant would be installed at Bridge Canyon Dam. Part of the energy there produced would operate pumps to lift water from Lake Havasu, behind the present Parker Dam, to an aqueduct which would be constructed to convey the water easterly to the main canal previously described, at a point near Cunningham, Wash. The remainder, fully two-thirds, of the electricity to be produced at Bridge Canyon Dam would be sold within an area where the demand already exists and will increase.

The cost of the tunnel will not be in evidence, as construction thereof would not occur until some date in the future, when Congress by making appropriation expressly therefor has determined that economic conditions justify its construction.

The bills also provide for a fully coordinated system for the efficient distribution and storage of water, and for the generation and transmission of electrical energy.

Revenues derived from the delivery of water and the sale of electricity would, well within the useful life of the project, repay the reimbursable costs thereof, although the costs allocated to flood control, desilting operations, recreation, and fish and wildlife control would not thus be reimbursed.

Mr. Chairman, the testimony in the previous hearing to which I have referred, and the documentary evidence which I have introduced today in support of these bills, may be divided into three subheads. First, the need of water for central Arizona; second, the feasibility of the central Arizona project; and third, the availability of the water for the project. I shall attempt to give a brief summary of the evidence under these three subheads.

THE NEED OF WATER FOR CENTRAL ARIZONA

We in Arizona have a high appreciation of the value of water and its proper and conservative use. Probably no State in the Union has produced more with the amount of water available than has Arizona. There are now or have been approximately 725,000 acres of irrigated land in central Arizona. In addition Arizona has irrigated approximately 60,000 acres of the original Yuma project from the Colorado River and some other small areas of the Colorado River which would not be benefited by this legislation. (Statement of W. W. Lane, p. 218 of the hearings on S. 1175.) There remain approximately 5,000,000 additional acres of fertile land which could be irrigated if only water were available.

However, as pointed out in the report of the Bureau of Reclamation, the central Arizona project " is essentially a 'rescue' project designed to eliminate the threat of a serious disruption of the area's economy" (p. 6 of the report).

The existing agricultural development in Arizona has made it a rich agricultural empire founded upon irrigation and playing a considerable part in the economy of the Southwest. The remains of irrigation facilities found by early settlers are evidence of an extensive prehistoric agriculture development, a development which was abandoned because of prolonged droughts. Irrigation started in Arizona as far back as the 1860's. In general, we think of our principal irrigation systems as falling within two areas traversed by the Gila and the Salt River and their respective tributaries.

W. W. Lane, in his statement found on pages 218 and 219 of the hearings gives the location of the 725,000 acres of irrigated land.

Our present sources of water supply for central Arizona consist of gravity water from the Salt and Gila Rivers and their tributaries, and water pumped from underground. The first major dam for the storage of water to be built in our State was the Roosevelt Dam, on the Salt River, which dam has a storage capacity of approximately 1,637,000 acre-feet of water; its construction was begun in 1903 and completed about 1910. Since that time three other dams have been constructed on the Salt River and two dams on the Verde River, a tributary of the Salt River. The resultant total capacity of all reservoirs for the Salt River is somewhat in excess of 2,000,000 acre-feet of water. Within the borders of the Salt River Valley Water Users' Association project there are 242,000 acres of irrigated lands. Adjoining this project there are several smaller ones; part of these lands are irrigated entirely by gravity water, part by pumped water, and some both by gravity and pumped water. The total irrigated area of these smaller projects, some of which are below the confluence of the Salt and Gila Rivers, is over 200,000 acres.

On the Gila River we have the San Carlos project. This project comprises some 100,000 acres, half of which are Pima Indian Reservation lands. It is irrigated in part by pumped water and in part from water impounded by the Coolidge Dam, which has a storage capacity of 1,200,000 acre-feet of water. There are also in Pinal County, adjoining the San Carlos project, over 100,000 acres of land irrigated entirely with pumped water. Further upstream on the Gila River, there is the upper Gila project, in Graham and Greenlee Counties, comprising some 40,000 acres, which are dependent entirely upon the normal flow of the river and upon pumped water.

It is of the essence to bear in mind that although the capacity for storage of water is commensurate to the need thereof, the quantity of actual water required to supply these areas is woefully inadequate.

The need for additional water for this area of land arises from an overdevelopment which has resulted from two causes.

(1) In the early days of the Bureau of Reclamation, it was estimated that the annual per-acre requirement at the farms was 3 acre-feet, and the water supply was estimated accordingly. This was based upon general farming in practice at that time. The chief crops were grain and alfalfa. Grain requires a relatively small amount of water; but with the development of irrigation, it was found to be more profitable, due to highly fertile soils and the long growing seasons permitted by favorable climatic conditions, to grow specialized crops out of season to most of the Nation, and multiple crops per year. This provides fresh foods to the Nation at times they are otherwise not available. However, it requires a high duty of water, and it is now found that 4 acre-feet of water per acre at the farm is required to maintain such production. (Note testimony of W. W. Lane, pp. 218–221, and of Vic Corbell, pp. 127–140, of said hearings; and the Bureau report, p. R–29.)

(2) Pumping first started principally because some of the lands were water-

logged; but with the increased efficiency of pumping and lower power costs, pumping increased because it was very profitable for irrigation. The net result is that pumping has overdeveloped, and the underground water supply is being exhausted. This overpumping from the basins underlying the central Arizona project area was estimated to be 468,400 acre-feet per year for the period 1940–44, inclusive. (Bureau report, p. R–6.)

Even with this water developed from overpumping, much of the land has been out of cultivation because of inadequate water supply. The Bureau of Reclamation report (pp. R–9 and R–29) states that 671,960 acres have been irrigated at some time in the past. Of this total an annual average of 566,170 acres was irrigated between 1940 and 1944. This meant that 105,790 acres of project land was idle between the years 1940 and 1944. In some areas this condition was even worse between 1944 and 1949. Mr. K. K. Henness, farmer and county agricultural agent of Casa Grande, testified at the hearings in June 1947 (p. 174 of said hearings) that there was only one-fourth enough water for the irrigated land in the San Carlos project at that time, and that the allotment was only eighty-five one-hundredths of an acre-foot. I understand some additional water was later made available by rains during the year, but this meant that the farmer could not adequately irrigate more than 25 percent of his land. This testimony was also corroborated by A. L. Bartlett, a farmer in that valley (said hearings, p. 207) and by Leon Nowell (said hearings, pp. 210–211).

While the Salt River Valley project, which has the more adequate water supply, was not in as bad a condition, they were likewise very short of water. Vic Corbell, in his statement at the earlier hearing (p. 130) spoke as follows:

"The history of the project has been that the amount of water available in any given year may range from a full supply down to 2 acre-feet per acre per annum, such as has been the case in the year 1947. In only 2 years in the last 25 years has a full supply been available. Based on rainfall records, tree-ring records, and other records and data available, it can be said that the rainfall has been normal the last 25 years; therefore, the unescapable conclusion is that there is more land within the project than that for which there is an adequate supply of water." This meant that in years like 1947 they had either to let one-half of the lands lay idle or inadequately to irrigate all of them, which amounts to about the same thing.

The need for this project development is shown by paragraph 9, page 2, of the Bureau report, which paragraph reads as follows:

"In spite of the developments now available, there is an acute water shortage in the project area. The 1940–44 average annual surface water supply was 1,676,600 acre-feet. This figure includes some reuse of surface water. To supplement the surface water supply an average of 1,163,000 acre-feet annually was pumped from the ground-water basin during the same period. This pumpage is estimated to be about 468,000 acre-feet in excess of the safe annual yield of the underlying ground-water basins. Obviously continued pumping at the present rate will lower the water table to such a point that many of the wells will become dry. The wells on the edge of the water basin could not be rehabilitated by deepening because the perimeter of the water-bearing strata will be constricted as this process continues."

It will be noted that the surface water supply is here estimated at 1,676,600 acre-feet per annum, including reuse, and according to the report this amount is comparable to the average over longer periods of time. For this reason, the noted periods were taken.

I would like to call your attention to the testimony of Mr. W. W. Lane (found on p. 219 of the hearings) which gives an average diversion from the Gila River system, from 1930 to 1944, of 1,697,000 acre-feet. It is calculated, according to Mr. Lane's testimony, found on page 220 of the hearings that the water so included in the total diversions is made up as follows:

	Acre-feet
Net river supply	1,135,000
Return flow from higher diversions	200,000
Salvage water, or water if permitted to flow in small flows as would if undisturbed and which would be lost to the stream by natural causes in the stream bed	362,000
Total	1,697,000

The Bureau of Reclamation estimates (p. 4 of its report) that in order to obtain the needed water for the project, it will be necessary to divert 1,200,000 acre-feet of Colorado River water, which will deplete the main stream flow 1,077,000 acre-feet. The balance will be returned to the river. This together with the small development from other dams would make up the water supply and would, according to said report as stated in paragraph 18, page 4, thereof—

"(Studies) indicate that this new water made available for diversion at the headgates of the irrigation districts each year would be sufficient to: (1) Replace the overdraft on the ground-water basins; (2) permit the drainage of excess salts out of the area and maintain a salt balance; (3) provide a supplemental supply to lands now in production, but not adequately irrigated; (4) increase the water supply for the city of Tuscon; and (5) maintain irrigation of 73,500 acres of land formerly irrigated but now idle for lack of water. There would not be sufficient water to permit irrigation of new land. There would, however, be sufficient water to permit stabilization and some improvement of the existing agricultural economy of the area."

Table 5, found on page R–31 of the Bureau of Reclamation report, shows the new surface water needed at the district headgates to be 1,082,000 acre-feet, which needs are set forth in the table following:

Water needed—Ultimate development

	Acre-feet a year
New surface water at district headgates	1,082,000
Pumpage in excess of safe annual yield	468,000
Increase in safe annual yield of ground water due to Colorado River water diverted to area	400,000
Net reduction in pumping	68,000
Outflow to maintain salt balance	376,000
Net reduction in pumping available for irrigation	444,000
Reduction in water at farm headgate assuming a 15 percent loss for pumped water	377,000
Surface diversions required to replace 377,000 acre-feet a year, assuming losses of 30 percent for diverted water	539,000
Supplemental water required for lands now irrigated	113,000
Water required for municipal supply	12,000
Subtotal	664,000
Water available for lands formerly irrigated but now idle for lack of water	418,000

The new surface water to be developed to meet these needs is set forth in table 4, page R–28 of said report as follows:

New surface water—Developed by central Arizona project ultimate development

New water available:	*Acre-feet a year*
Diverted from Colorado River	1,200,000
Developed by Horseshoe Dam enlargement	42,000
Developed by Buttes Reservoir	64,000
Developed by upper Gila River developments	19,000
Channel losses conserved by Charleston Reservoir	7,000
Gross new surface water	1,332,000
Losses, Granite Reef aqueduct	200,000
Losses, Salt-Gila aqueduct	50,000
Total aqueduct losses	250,000
New surface water at district headgates	1,082,000

According to the report, if this water supply is made available for the project, 73,500 of the 105,790 acres formerly irrigated but now idle for lack of irrigation, can be irrigated. In addition to this amount, as shown in table B–5 of the report, it would be possible to sustain irrigation of an additional 152,520 acres which would otherwise have to be retired from irrigation. This would mean a total of 226,020 acres, which would otherwise be compelled to remain forever idle, could be maintained in production by this project.

If this project is not developed, what would this mean to the economy of the State? The estimated population of the agricultural communities of Arizona in 1947 was 504,000 (see first table on p. 152 of said hearings). Figuring upon a percentage basis, the previously indicated exclusions from cultivation, which must occur if the project is not authorized, would deprive approximately 150,000 persons of their incomes or means of livelihood, and they would be "displaced persons." It would mean the failure of banks and businesses, that literally thousands of families would lose their life earnings invested in farms, homes, and business establishments. The problem of overcoming these business failures and placing these bankrupt and homeless people upon their feet would indeed be great.

I need not further dwell upon the testimony showing the need for this project; but I will call attention to the testimony of various witnesses at said hearing, all of whom portrayed this picture. They are: Wayne M. Akin, pages 111–120; A. L. Bartlett, pages 204–209; Walter R. Bimson, pages 147–151; V. I. Corbell, pages 127–140; E. R. Cowden, pages 215–216; N. M. Dysart, pages 160–162; K. K. Henness, pages 172–182; Alfred Jackson, pages 200–202; J. M. Jacobs, pages 162–165; D. A. Johnson, pages 415–417; A. T. Jones, pages 196–200; W. W. Lane, pages 217–221; P. J. Martin, pages 158–160; G. W. Mickle, page 214; J. T. McChesney, pages 216–217; C. H. McKellips, pages 121–125; C. Neely, pages 212–213; L. M. Nowell, pages 209–212; D. Stanley, pages 165–169; J. A. Udall, pages 169–172; and A. Van Wagenen, pages 203–204.

FEASIBILITY OF THE CENTRAL ARIZONA PROJECT

It is estimated in the Bureau of Reclamation Report that this project, leaving out the cost of the tunnel for the reasons I have already stated, would cost approximately $738,408,000, which is made up from the table of items found on page 15 of the report as follows:

Construction costs

Bluff Dam and Reservoir	$29,628,000
Coconino Dam and Reservoir	7,487,000
Bridge Canyon Dam and Reservoir	191,939,000
Bridge Canyon power plant	73,419,000
Havasu pumping plants	25,973,000
Granite reef aqueduct	131,716,000
McDowell pumping plant and canal	3,346,000
McDowell Dam and Reservoir	16,326,000
McDowell power plant	1,012,000
Horseshoe Dam (enlargement) and Reservoir	7,078,000
Horseshoe power plant	2,628,000
Salt-Gila aqueduct	34,585,000
Buttes Dam and Reservoir	29,037,000
Buttes power plant	1,159,000
Charleston Dam and Reservoir	9,270,000
Tucson aqueduct	6,401,000
Safford Valley improvements	4,090,000
Hooker Dam and Reservoir	15,484,000
Irrigation distribution system	54,086,000
Drainage system for salinity control	9,973,000
Power transmission system	83,771,000
Total	738,408,000

The allocations of these costs are found on page 16 of the report in table 2, as follows:

Allocations

Item	Existing reclamation law	Rockwell bill, H. R. 2873	McFarland bill, S. 1175	Combination of S. 1175 and H. R. 2873 as slightly modified by recommendations of the regional director
Power	$291,160,000	$243,744,000	$247,190,000	$243,798,000
Irrigation	420,019,000	397,488,000	404,982,000	397,693,000
Municipal	18,014,000	16,605,000	16,865,000	16,605,000
Flood control [1]	6,290,000	6,907,000	6,270,000	6,641,000
Fish and wildlife [1]	2,925,000	3,127,000	2,826,000	3,129,000
Silt control [1]		28,097,000	26,511,000	28,097,000
Recreation [1]		37,454,000	33,764,000	37,459,000
Salinity control [1]		4,986,000		4,986,000
Total	738,408,000	738,408,000	738,408,000	738,408,000

[1] Nonreimbursable items.

NOTE.—The item known as the Rockwell bill may be eliminated as the authorization would be made under S. 75 as far as the repayments provision is concerned.

The report definitely shows that the central Arizona project has engineering feasibility in that there are no physical obstructions that would be encountered during its construction that could not be overcome (par. 27, p. 7, report).

The project is also financially feasible under the provisions of S. 75 and House bills 934 and 935 in that it could reasonably be expected to repay the reimbursable portions of its construction costs well within the useful life of the project. It has been found that $4.75 per acre-foot, which local interests have indicated they are willing and able to pay, would more than pay the operation and maintenance costs and replacement costs allocated to irrigation. It has also been found that a charge of $0.15 per thousand gallons for municipal water would fully repay all costs allocated to that purpose and would be equally advantageous to the municipal water users. The power rate necessary to accomplish a repayment of all reimbursable costs assigned to be repaid from power revenues would be extremely reasonable. Such low-cost power would represent a distinct advantage to power users in that area (pp. 7–8, report).

The project represents a sound investment for the Nation in that the tangible benefits of the project would exceed the total cost to the Nation in the ratio of 1.63 to 1.

In addition, there would be innumerable intangible benefits accruing to the State of Arizona and to the Nation as a whole as a result of the central Arizona project (pp. R–73–77, report).

In addition to the sources which I have more specifically indicated, the feasibility of the project is thoroughly supported in the testimony of the following witnesses at such hearings: Dr. G. W. Barr, pages 183–196 and 558; E. B. Debler, pages 292–307; L. G. Galland, pages 202–203; H. A. Leggett, pages 151–158; R. A. Meeker, pages 473–481; E. A. Moritz, pages 31–35; R. J. Tipton, pages 522–548; Wm. Warne, pages 8–24 and 25–30; K. S. Wingfield, pages 552–555; V. E. Larson, pages 35–111 and 395–404.

AVAILABILITY OF WATER FOR THE PROJECT

When speaking of the availability of water, one must remember that there is the separate item of the physical quantities which may be available, and the distinct but related item of legal entitlement to the use of water.

I say with positive assurance that there is adequate water in the Colorado River fully to supply the central Arizona project and that Arizona is clearly entitled as a matter of right and justice to the exclusive use of that water. Moreover, such use will not interfere with or burden any other right of use existing in law.

The long-term (1897–1943) average annual flow of the Colorado River under virgin conditions at Lee Ferry was 16,270,000 acre-feet; at the international boundary it was 17,720,000 acre-feet. The average annual flow under virgin conditions for the years 1931 to 1940, a period of low flow, at Lee Ferry was

12,214,000 acre-feet; at the international boundary it was 13,001,000 acre-feet. (Statements of V. E. Larson, pp. 46–47 of hearings, and E. B. Debler, pp. 301–303.) Mr. Debler pointed out that in low run-off period, and allowing for evaporation and other losses, the over-all or total availability for depletion to all users of the Colorado River water may be a bit less than the maximum quantities apportioned in the Colorado River compact and by the water treaty with Mexico. Even so, there would be available for diversion to Arizona for its central Arizona project 1,200,000 acre-feet, which is the amount required. (See Mr. Larson, p. 54; Mr. Debler, p. 303.) Mr. R. J. Tipton took occasion to note his concurrence with Mr. Debler (pp. 535–539). Mr. Debler estimated that the net annual depletion of the Colorado River water by the central Arizona project will be 1,067,000 acre-feet (p. 303).

I have condensed my statement concerning the physical availability of water to the foregoing ultimate factual assertions, but the other and more extensive evidence will supply both detail and corroboration.

Now we come to the question of the availability of water or Arizona's right to water as a matter of law.

This phase of the case may be much more readily presented and grasped by a review of matters leading to our present situation.

In the year 1922 the States of the geographical area described in the testimony as the Colorado River Basin, were striving among themselves to arrive at an agreement leading to the beneficial use of the waters of the Colorado River for irrigation and the generation of electric power. The delegates from these States proposed the now renowned Colorado River compact. A controversy arose over the inclusion of the waters of the Gila River within the Colorado River system and hence with those to be apportioned by the compact, a move unalterably resisted by the Arizona delegation because the waters of the Gila had long been put to beneficial use by the citizens of that State, and because the waters of the Gila enter the Colorado at a point so southerly as to prevent the enjoyment thereof by any of the basin States other than Arizona. In fine, the Gila was no part of the Colorado waters which were the proper subject of apportionment. The Arizona delegates were agreeable, however, to the provisions of article III (a) of the compact, which proposed the annual apportionment to the upper basin, and a like apportionment to the lower basin, of 7,500,000 acre-feet of water from the Colorado River if the waters of the Gila were reserved for Arizona. As a consequence, and in order to compensate Arizona for the inclusion of the Gila waters in the Colorado River system, the delegates agreed upon article III (b) of the compact, which reads as follows:

"(b) In addition to the apportionment in paragraph (*a*), the lower basin is hereby given the right to increase its beneficial consumptive use of such waters by 1,000,000 acre-feet per annum."

This quantity of 1,000,000 acre-feet per annum corresponds to the then estimated annual flow of the Gila River at its mouth where it empties into the Colorado.

The history of the meaning and purpose of article III (b) of the compact is related in the testimony of Mr. Ralph Meeker, who was, during the negotiation of the Colorado River compact at Santa Fe, the engineer adviser for the State of Colorado. He was present at the compact sessions and of his own personal knowledge is familiar with the background of the compact. His testimony is found from page 473 to page 481 of the record of the hearing on S. 1175. I call particular attention to pages 475 through 476 thereof, where Mr. Meeker makes it plain that it was understood by all the negotiators that 1,000,000 additional acre-feet were apportioned to the lower basin to be used in Arizona, because the Gila River was included in the compact. He also quoted (p. 475) from the report of Frank C. Emerson, commissioner for the State of Wyoming for the Colorado River compact, and from a citation from The Colorado River Compact, by Rouel Leslie Olson, showing that this was understood by L. Ward Bannister, special representative for Colorado at the negotiations.

Likewise, in support of the identical history and meaning of this article III (b), I refer to the testimony of Mr. Charles A. Carson, now chief counsel for the Interstate Stream Commission of Arizona, wherein he incorporates testimony of Hon. Thomas E. Campbell, former Governor of Arizona (p. 225 et seq. of said hearings); of Mr. W. S. Norviel, Arizona's commissioner at the compact sessions (p. 227 et seq. of said hearings); and of Mr. C. C. Lewis, another of Arizona's representatives at such sessions (p. 229 et seq. of said hearings). The testimony of the three individuals last named is based upon personal participation and direct knowledge of these matters.

Hon. Herbert Hoover, then Secretary of Commerce, who represented the Federal Government and presided at the compact sessions, most certainly knew and recognized that Arizona had succeeded in gaining the apportionment made in article III (b) to compensate for the inclusion of the Gila within the Colorado River system. (Note Mr. Carson's testimony, pp. 222–224 of said hearings.)

Mr. E. B. Debler, who has had intimate personal connection with the problems of the Colorado River continuously since a date prior to the compact, who from 1921 to 1943 was in charge of most of the project planning for the Bureau of Reclamation, and who from 1944 to April of 1947 was regional director of the Bureau's region 7, is entirely clear that an additional million acre-feet was apportioned by article III (b). (See, for example, his statement at pp. 292–294 of said hearings.)

When the Arizona delegate signed the compact in November of 1922, he did so with a clear understanding and agreement that the States of Nevada, California, and Arizona would enter a tri-State agreement which, among other things, would apportion to Arizona the exclusive beneficial use of all water of the Gila River, the equivalent of the 1,000,000 acre-feet of water apportioned in article III (b) of the compact. (See pp. 222, 225–226, 228–229.) Thereafter, California would not agree to a just division of the water of the Colorado River which had been apportioned to the lower basin; so the people of Arizona would not ratify the compact at that time.

The Colorado's uncontrolled flow proved increasingly harmful as well as wasteful of potential benefit. California's anxiety to avoid floods along the neighboring California lowlands and to procure water and electric energy for her coastal communities made her especially anxious to harness and utilize the Colorado. Further interstate negotiations having proved unavailing, congressional action for the construction of Boulder Dam was inaugurated. This led to the passage of the Boulder Canyon Project Act (45 Stat. 1057, Public Law 642, 70th Cong.) on December 21, 1928.

As to the course of that bill in the Senate, I quote from testimony given by Senator Hayden at the hearings on Senate Joint Resolution 145 of the Eightieth Congress (pp. 333–334):

"The only thing I might contribute very briefly is a little bit of history of the adoption of the Boulder Canyon Project Act, which might interest this committee. It was designed to make sure that the State of Arizona obtained no water out of the Colorado River until we had adopted the Colorado River compact. Senator Ashurst and I objected to that; that we thought it should provide for the irrigation of land in Arizona as well as California.

* * * * * * *

"The bill came up in the Senate toward the end of a long session of Congress, and it was made the unfinished business, but, as the situation is now, the appropriation bills had the right-of-way, so Senator Ashurst and I had no difficulty at all in keeping the unfinished business and preventing a vote on it even though there was a cloture petition which failed to obtain two-thirds majority. It was then made the unfinished business in the December session exclusively, and we just debated it day by day.

"In an effort to work out some method whereby the bill might pass, Senator Pittman, of Nevada, made this suggestion to Senator Ashurst and I, that inasmuch as the State of California had obligated itself not to take out of the apportioned water more than 4,400,000 acre-feet, that left the remainder of the 7,500,000 acre-feet to be apportioned in the lower basin. He said, 'Of course, Congress cannot divide water among States, but Congress can approve a compact among the States and indicate what the compact means.' 'Therefore,' he said, 'all of the water that Nevada wants is some 300,000 acre-feet,' and we could put a provision in the bill looking to an interstate agreement in the lower basin and give the advance approval that would allocate to Nevada 300,000 acre-feet and Arizona 2,800,000 acre-feet.

* * * * * * *

"So, when we came to work out what should be done about the lower basin, I insisted that we should make the Gila Basin thing perfectly clear, and so you will remember that there is in the act that provision that the State of Arizona shall have the exclusive beneficial use of all of the waters of the Gila River within its boundaries, and that no part of it should be allocated to Mexico.

"As I say, we continued to filibuster until we worked out that kind of an arrangement. It was entirely satisfactory to Senator Johnson and Senator Shortridge, of California, because their State was obligated to obtain so much water. So far as the Gila Basin was concerned, they agreed with us that it

entered the Colorado River below any possible point of diversion into California, and, therefore, they had no interest in it, and on that basis we concluded that we would allow a vote on the bill, and it passed the Senate."

I would like to call attention to the fact that the act by its own terms (sec. 4 (a)) was to become effective upon either of two conditions. The first of these was ratification of the Colorado River compact within 6 months by all seven of the States affected. The second was ratification of the compact by six of the interested States, including California, and the irrevocable and unconditional enactment by the legislature of the latter State of a statute which (and I now quote the exact language of said section 4 (a)): "shall agree irrevocably and unconditionally with the United States and for the benefit of the States of Arizona, Colorado, Nevada, New Mexico, Utah, and Wyoming, as an express covenant and in consideration of the passage of this act that the aggregate annual consumptive use (diversions less returns to the river) of water of and from the Colorado River for use in the State of California, including all uses under contracts made under the provisions of this act and all water necessary for the supply of any rights which may now exist, shall not exceed four million four hundred thousand acre-feet of the waters apportioned to the lower basin States by paragraph (a) of Article III of the Colorado River compact, plus not more than one-half of any excess or surplus waters unapportioned by said compact, such uses always to be subject to the terms of said compact."

California promptly enacted a statute (act 1492, Calif. Stat. 1929, p. 38), sometimes spoken of as the Self-Limitation Act, the pertinent part of which is verbatim with the language just quoted from the Boulder Canyon Project Act. In view of the extremely liberal quantity of water specified as a maximum, and in view of her need for flood control, water, and electrical energy, California's willingness to adopt her Self-Limitation Act is quite understandable.

Section 4 (a) of the Boulder Canyon Project Act also unequivocally voiced the permanent intention of the Congress to define and limit California's maximum rights, and California irrevocably and unconditionally agreed to that limitation.

Having limited California to 4,400,000 acre-feet per annum of the 7,500,000 acre-feet apportioned by article III (a) of the Colorado River compact, as I have already shown, and having further limited California to half of any excess or surplus waters unapportioned by that compact, Congress further provided that—

"The States of Arizona, California, and Nevada are authorized to enter into an agreement which shall provide (1) that of the 7,500,000 acre-feet annually apportioned to the lower basin by paragraph (a) of article III of the Colorado River compact, there shall be apportioned to the State of Nevada 300,000 acre-feet and to the State of Arizona 2,800,000 acre-feet for exclusive beneficial consumptive use in perpetuity, and (2) that the State of Arizona may annually use one-half of the excess or surplus waters unapportioned by the Colorado River compact, and (3) that the State of Arizona shall have the exclusive beneficial consumptive use of the Gila River and its tributaries within the boundaries of said State, and (4) that the waters of the Gila River and its tributaries, except return flow after the same enters the Colorado River, shall never be subject to any diminution whatever by any allowance of water which may be made by treaty or otherwise to the United States of Mexico * * *."

The foregoing factors plainly define the congressional purpose. Congress manifestly intended that of the 7,500,000 acre-feet of Colorado River water apportioned by article III (a) of the compact, Nevada is to receive 300,000; Arizona not less than 2,800,000; and California not to exceed 4,400,000. It is also clear that Arizona should receive, in addition, all the waters of the Gila River, both because of the previously mentioned insertion in the compact of its article III (b)—which apportions 1,000,000 acre-feet per annum to the lower basin to compensate Arizona for inclusion of the Gila in the Colorado River system—and because of the specific authorization (in sec. 4 (a) of the Boulder Canyon Project Act) of the agreement whereby Arizona is to receive all the water of the Gila and its tributaries within Arizona's boundaries.

From the mere reading of the language of the Boulder Canyon Project Act it is evident that Congress proposed to California the terms of a contract for the explicit benefit of Arizona, Nevada, and the other interested States. The contract thus proposed was as follows: Of the 7,500,000 acre-feet of Colorado River water apportioned to the lower basin by article III (a) of the compact, California should have not to exceed 4,400,000 and that California could use

not more than one-half of any water in excess of or surplus to the water apportioned by the compact, which might be available in the lower basin. California, by adopting its Self-Limitation Act, unequivocally and unconditionally accepted this proposal and thereby completed a binding contract. As California may not have more than 4,400,000 acre-feet of the water apportioned by article III (a) of the compact, the balance is for Nevada and Arizona; and Congress has in terms indicated its intent that Nevada have 300,000 acre-feet and Arizona not less than 2,800,000 acre-feet. This intent has been executed. The water involved in article III (b) of the compact not only is "apportioned" water, but is in effect apportioned to Arizona for the reasons shown. The Colorado River water which is available in the lower basin in excess of or surplus to that apportioned by articles III (a) and III (b) of the compact is to be equally divided between California and Arizona.

This contract between the State of California and the United States—for the benefit of the States of Arizona, Colorado, Nevada, New Mexico, Utah, and Wyoming—just as completely settled California's rights as any compact could do. Congress by approving in advance a compact between Arizona, California, and Nevada definitely gave its interpretation of the California Self-Limitation Act, which is the one Arizona now relies upon; and California by adoptng the act accepted and agreed to this interpretation.

Arizona, relying on the protection thus afforded her, adopted and ratified the Colorado River compact. A large number of the people of Arizona believed that Congress had not required California to limit herself to a small enough quantity of the waters of the Colorado River. However, Arizona had little choice, as the rights of the States were well defined in the Boulder Canyon Project Act. She has entered into a contract with the Secretary of the Interior, which contract calls for delivery of 2,800,000 acre-feet of Colorado River mainstream water per year, plus one-half of the excess of surplus water unapportioned by the compact which may be available in the lower basin, less one twenty-fifth of such surplus water, to be used by Nevada. (The contract appears at pp. 240–243 of said hearings on S. 1175.)

It is significant that the Department of the Interior in a regulation promulgated by it under date of February 7, 1933, authorized the proffer to Arizona of a water-delivery contract which contained this provision:

"Ten. From storage available in the resorvoir created by Hoover Dam, the United States will deliver under this contract each year, at points of diversion hereinafter referred to on the Colorado River, so much of the available water as may be necessary to enable the beneficial consumptive use in Arizona of not to exceed 2,800,000 acre-feet annually by all diversions effected from the Colorado River and its tributaries below Lee Ferry; *but in addition to all uses of waters from the Gila River and its tributaries.*" [Italics supplied.]

Also article 15 (a) provided—

"The State of Arizona will hereafter grant no permits for, nor otherwise authorize, uses of the waters of the Colorado River and its tributaries other than the Gila River and its tributaries, except subject to the terms of this contract." (Hoover Dam Contracts, p. 373; p. 238 of said hearings.)

The change in administration shortly thereafter terminated negotiations for this contract; but the noted language is most illuminating as an administrative determination by the Bureau of Reclamation of Arizona's right to all the water of the Gila, as well as 2,800,000 acre-feet annually of the main-stream waters of the Colorado stored at Hoover Dam Reservoir (see p. 238 of said hearings).

California admits that she is bound by the California Self-Limitation Act and is not entitled to more than 4,400,000 acre-feet of III (a) water and one-half of any excess or surplus water unapportioned by the compact. However, in an effort to procure more so-called surplus waters for herself, thereby in actuality reducing the quantity of apportioned water to which Arizona is rightfully entitled, California has elected to pursue a stratagem based largely upon two patently strained and inequitable constructions of the wording of the Colorado River compact. In a general way, these false constructions may be stated as follows:

(*a*) The water described in article III (b) of the compact is water unapportioned by the compact.

(*b*) A definition of "beneficial consumptive use" which would charge Arizona with the total water reaching the Gila watershed rather than with the amount by which she depletes the waters of the Colorado River at the mouth of the Gila.

Neither of these contentions is supported by the intentions of the framers of the compact or by those of the Congress.

As to the contention that the water embraced in article III (b) of the compact is not apportioned, and therefore falls within the class of "surplus or unapportioned" water of which California may have half under the provisions of the Boulder Canyon Project Act, enough has been said above to demonstrate its utter fallacy. Congress in effect has indicated its intention as to the division of the waters apportioned by article III (a) of the compact (i. e., California, not more than 4,400,000; Nevada, 300,000; Arizona, not less than 2,800,000; total, 7,500,000). As shown, the ultimate purpose of article III (b) was to apportion the waters of the Gila to the lower basin for use by Arizona, and Congress explicitly recognized this apportionment by express language in the Boulder Canyon Project Act. It is therefore clear to anyone who cares to see, that the waters upon which article III (a) of the compact is effective (i. e., 7,500,000 acre-feet of Colorado River water) and those upon which article III (b) is operative (that is, in final effect, the 1,000,000 acre-feet of the Gila which was thought to be substantially all thereof) are "apportioned water." The excess or surplus waters above such apportioned water are for equal division between California and Arizona (with the small reservation for Nevada previously noted).

The record abounds with proof, both within the context of the compact and of the project act, as well as in collateral circumstances, that this is the true and just situation.

I invite attention to the testimony of Judge Clifford H. Stone, director, Colorado Water Conservation Board and commissioner for Colorado for the Upper Colorado River Basin Compact Commission, whose ability, impartiality, and knowledge of these problems are generally recognized. His testimony appears on pages 513 through 521 of said hearings on S. 1175. Judge Stone demonstrated that the water embraced in article III (b) of the compact is definitely "apportioned water" (p. 513), and that the Supreme Court of the United States has so held in the case of *Arizona* v. *California* (292 U. S. 341 et seq. (p. 517)). He points out that the compact is clear and unambiguous, within its own four corners, as to the apportionment of water (p. 513); that the will of the legislatures which ratified the compact is paramount (p. 514), and that such will cannot in law be now thwarted through collateral efforts and documents (pp. 516–517). At page 517, Judge Stone quotes the following language from a letter from the Honorable Herbert Hoover, who was the chairman of the Colorado River Compact Commission:

"Due consideration is given to the needs of each basin, and there is apportioned to each 7,500,000 acre-feet annually from the flow of the Colorado River in perpetuity, and to the lower basin an additional million feet of annual flow, giving it a total of 8,500,000 acre-feet annually in perpetuity."

I also wish to call attention to page 395 of the book entitled "The Hoover Dam Contracts," which contains the following question to Mr. Hoover in a letter of Mr. Clarence C. Stetson, and Mr. Hoover's answer:

"Why is the basis of division changed from the 'Colorado River system' to the 'river at Lee Ferry' in paragraph (d) of article III, the period of time extended to 10 years and the number of acre-feet multiplied by 10?"

"I do not think there is any change in the basis of division as the result of the difference in language in articles III (a) and III (b). The two mean the same thing. By reference to article II (f) it will be seen that Lee Ferry, referred to in III (d), is the determining point in the creation of the two basins specified in III (a)."

Mr. Carson ably and fully establishes the accuracy of the foregoing outline of historical and legal matters, as well as other cogent factors leading to the inescapable conclusion that Arizona is entitled to all the waters of the Gila within Arizona and not less than 2,800,000 acre-feet annually of water of and from the main streams of the Colorado (pp. 221–291; 481–495). In noting that the Supreme Court had held the III (b) waters to be apportioned, Mr. Carson added that the Court also pointed out that that article is without ambiguity (pp. 235, 481 of said hearings.)

The second of the devices by which California hopes to gain additional water involves its own definition, highly beneficial to that State, of "consumptive use." The question is whether the quantity of water put to "beneficial consumptive use" along the course of a tributary to the Colorado River is equivalent to the amount of depletion of the virgin flow of such tributary at the confluence thereof with the Colorado River. California applies its definition of consumptive use to Arizona by insisting that Arizona is chargeable with all the water flowing in the Gila watershed which does not reach the Colorado. As California has no real tribu-

tary to the Colorado River and contributes practically no water to the main stream thereof, her definition is therefore peculiarly beneficial to herself and detrimental to Arizona and the upper-basin States.

It is Arizona's theory that we are chargeable only with the amount of water by which we deplete the main stream of the Colorado River. That is the only amount which affects the other States. The Gila River, as has been explained, admittedly empties into the Colorado at a point which prevents use of the Gila waters by any other State. The virgin flow of the Gila at such confluence is now estimated at approximately 1,270,000 acre-feet per annum (pp. 35, 47 of said hearings), although when the compact was drawn, as above noted, the virgin flow was thought to be about 1,000,000 acre-feet and the latter was consequently the amount used in article III (b) as the additional quantity apportioned to the lower basin for use by Arizona.

As has been demonstrated, the framers of the compact, for the precise purpose of compensating Arizona for the inclusion of the waters of the Gila River within the Colorado River system, apportioned an extra million acre-foot per annum to the lower-basin States, for use by Arizona. Simply stated, Arizona was to have the use of the waters of the Gila. Congress then proceeded to place an absolute and concrete interpretation upon the compact when it enacted the Boulder Canyon Project Act, wherein it specifically authorized a compact for apportionment of the 7,500,000 acre-feet of water flowing in the Colorado River below the point of delivery at Lee Ferry (the water embraced in article III (a) of the compact) and for the exclusive beneficial consumptive use by Arizona of the Gila River and its tributaries within the boundaries of that State (the equivalent quantity of water embraced in art. III (b) of the compact) explicitly providing that, except as to return flow of the Gila waters after the same enter the Colorado, the Gila waters should never be subject to diminution by any allowance of water to Mexico under treaty. As indicated, the physical, geographical fact is that water of the Gila, after entering the Colorado, can be used solely in Mexico. It follows that Congress clearly recognized and intended that any measurement of Gila waters under the compact and project act must necessarily be gaged by the amount of depletion of the Colorado at the mouth of the Gila, a process inevitably involving establishment of the difference between virgin flow and actual outflow.

Congress made its views clear to California in the Boulder Canyon Project Act; and as California accepted the terms of that act by promulgating its own Self-Limitation Act, restricting itself to 4,400,000 acre-feet of the Colorado waters apportioned by article III (a) of the compact plus not more than one-half of any excess or surplus waters unapportioned thereby, California perforce recognized the method for determining what was "excess or surplus waters," which method among other elements gave to Arizona 2,800,000 acre-feet per annum of the Colorado River water controlled by article III (a) of the compact, as well as all the Gila waters, except return flow after the same entered the Colorado.

The foregoing is by no means the only argument or theory substantiating Arizona's contention; it is merely supplemental to other probative circumstances appearing in the testimony.

In any consideration of the term "beneficial consumptive use" it is essential that a differentiation be maintained between the chemical and physical processes which attend the consumption and use of water, and the geographical place where such use is to be measured. It seems evident that the framers of the compact had in mind the apportionment of gross quantities of water and the measurement thereof in terms of depletion of the Colorado River.

As Mr. Meeker states, the negotiators of the compact were thinking of and dealing with surface waters (p. 476); and they considered consumptive use in terms of depletion of the Colorado (p. 477), the measurement of which depletion in the case of a tributary involved the difference between the virgin flow and the actual out-flow, such difference being the consumptive use (p. 480). The negotiators' intention was that the upper basin could deplete the Colorado by 7,500,000 acre-feet per year, measurable at Lee Ferry, and that the lower basin might deplete the river by 8,500,000 acre-feet per year, measurable at the boundary between the United States and Mexico (p. 475). The depletion caused by use of the water of the Gila was to be measured at its confluence with the Colorado (p. 475).

Mr. Tipton summarized the respective positions of California and Arizona in this language (p. 522 of said hearings):

"Beneficial consumptive use as it is used in the Colorado River compact is interpreted by California to mean the aggregate of all the individual items of

consumptive use at the points of use. Arizona interprets the term to mean depletion of main-stream Colorado River waters as a result of man's activities."

He then conclusively demonstrated the propriety of the Arizona view, noting the peculiar and unique benefit which would accrue to the benefit of California alone and the harm which would fall upon all the other basin States if California's theory is sound. He states (p. 529):

"It is my conclusion that the Colorado Compact Commission did apportion the virgin flow of the Colorado River and that it considered consumptive use to be synonymous with depletion at Lee Ferry and that it did consider consumptive use on the Gila to be synonymous with the depletion of the Gila river flow at the mouth."

He also logically pointed out that the term should be taken as intended by the commissioners, rather than by latter day partisans, and that the commissioners used such term as I have just outlined (pp. 523–524). Mr. Hoover also held this view as to the equivalence of consumptive use and depletion (p. 525). Mr. Tipton noted that notwithstanding California's claim to a self-created "priority" of 5,362,000 acre-feet of Colorado River water per year, her actual maximum diversion up to 1945 was approximately 2,800,000 acre-feet (p. 540). Of 2,717,530 acre-feet delivered to California in 1946, 1,074,150 flowed as waste to the Salton Sea (Bureau of Reclamation chart, p. 568). Mr. Tipton noted that California is attempting to carve out her fanciful "priority" from Arizona's water and the supplies of the upper basin (pp. 541–542).

In the course of his testimony (pp. 522–548), Mr. Tipton is at pains to support his opinions by references to minutes of the meetings of the compact sessions, and the views of eminent engineers and lawyers.

I would also call attention to the testimony of Mr. Charles A. Carson, given upon this topic (pp. 481 to 490), which sustains the soundness of Arizona's position.

Particularly, I desire to reemphasize the testimony of the Honorable Clifford H. Stone on this subject (pp. 519 to 521). I call special attention to that portion where it is pointed out that the framers of the compact intended depletion to be the measure of consumptive use. I also call attention to the language of Judge Stone at the conclusion of his testimony, which language I now quote:

"Then, in conclusion, the Congress, we believe, will not approve an unconscionable position in interpreting the Colorado River compact for the purpose of proposed legislation. Nor would a court give approval to any interpretation of a solemn agreement among States which would be inequitable. It cannot be assumed that the compacting States intended to apportion water between the upper and lower basins of the Colorado River by terms and conditions the interpretation of which would limit one of the States to its existing uses of water when the compact was made, with a comparatively small opportunity for future development. We submit that the States did not do so."

Patently, throughout the testimony of California, this is exactly what her witnesses are saying: The compact must be so interpreted that the Gila River is practically all of the water to which Arizona is entitled.

I will not reiterate the arguments at length, but will call attention to the fact that it is admitted by California witnesses that if Arizona did not appropriate water of the Gila and allowed such water to flow in an uncontrolled manner, the other States would not even get the benefit resulting from the supply of a million acre-feet to Mexico under the treaty. Because of the terms of the treaty, and because the unappropriated waters would go down the river in flood periods, not nearly a million acre-feet could be used by Mexico under the circumstances. Reference is made to the testimony of Mr. C. C. Elder, hydraulic engineer, metropolitan water district of southern California (pp. 423–424), and of Mr. James H. Howard, general counsel, metropolitan water district of southern California (p. 332), where admissions of this point are made.

Nothing is more indicative of California's stubborn intention to gobble up much more than the lion's share of the water, than her stand upon the question of evaporation losses. She contributes nothing to the Colorado, and she is far and away the greatest beneficiary thereof. Yet, she would bear none of the loss of evaporation, and would foist that, too, upon her sister States. Arizona favors an equitable distribution of these losses in proportion to the beneficial interests (note Mr. Carson's remarks as to evaporation losses, pp. 62–64; and Mr. Debler's remarks and schedules, pp. 300–307).

Some point was made of the absence of an underground water code in Arizona. Such a code now exists. It is contained in chapter 5, Laws of the Sixth Special Session of the Eighteenth Legislature of Arizona.

A contention which California has been at pains to make, and which is a most prolific part of the propaganda which she is spreading far and wide, including a general distribution to the Members of Congress, is that California has an overwhelming, present, imminent need for all of what it describes as "its established rights to its share of Colorado River water." As I have already noted, California has raised itself by its bootstraps to the point of creating for California agencies, by agreement among themselves, so-called priorities to the use of 5,362,000 acre-feet of water per year. By her Self-Limitation Act, the State of California restricted herself and all uses in that State to 4,400,000 acre-feet per year of the apportioned waters, plus one-half of the excess or surplus waters of the river.

Arizona does not admit that California's argument based upon her alleged need has any proper place in this hearing. Assuming that there were a need, as claimed, such need alone would certainly not give California any right to water which belongs to and is needed by Arizona.

However, inasmuch as California persists in this argument, I desire to point out various facts which demonstrate that the alleged need does not in truth exist, and that the claim in this respect is not supported by the evidence.

To begin with, California herself admits that her present annual use of the Colorado River water is "something like 3,000,000 acre-feet" (see Mr. Matthews' testimony, p. 377 of said hearings on S. 1175). Her witnesses also admit in their testimony that she desires to place into cultivation an additional 300,000 acres of the areas known as the east and west mesas in the Imperial Valley. They do not deny that if this land were not placed into cultivation, California would have all the water she needs (for example, note Mr. Matthews' testimony at pp. 386–388 of said hearings).

I desire to make it clear, first, that California's asserted needs are for the future, to permit her to grow and to expand; Arizona's need is immediate, not for growth and expansion, but for the maintenance and support of the property and livelihood which our people now have and are in jeopardy of losing. Secondly, if only California does not persist in her plan to place into cultivation the additional 300,000 as yet undeveloped acres in said mesas, Los Angeles and San Diego may continue to drink, and her farmers in the areas now supplied by the Colorado River may continue to farm.

This is a topic set forth in considerable detail in the Land Classification and Development Report on the Imperial east mesa, which has been submitted to the Commissioner of Reclamation by the regional director, Mr. E. A. Moritz. The soil surveys upon which this report is based were conducted cooperatively by California's own university and the United States Department of Agriculture. The report on the Imperial west mesa has not yet been completed. This is perhaps due to the circumstance that the lands of the west mesa, taken at their best, are no more than equal to those of the east mesa, and probably are considerably inferior. Even so, most of the west mesa could be irrigated only by pumping water to elevations ranging up ward to 300 feet.

Of the 225,300 acres covered in the report above mentioned, only 35,900 acres (or about 16 percent) are classified as irrigable; and of this number of irrigable acres only 5,350 acres were classified as class II lands, the remaining 30,500 acres being classified as class III lands, the poorest class of irrigable lands. The balance of the lands on the east mesa, comprising 189,400 acres, were classified as nonirrigable lands, defined as follows:

"Lands that appear to be permanently nonagricultural under the practices of irrigation farming" (p. 49 of the noted report last mentioned).

However, even as to the lands classified as irrigable, the Bureau of Reclamation has not made its recommendations as to feasibility for irrigation. The irrigable lands are spotted over the mesa in such a manner that the cost of irrigation thereof, if not prohibitive, is so high as to render irrigation unfeasible in view of their inferior quality.

The point that I desire to repeat is, that even assuming the same percentage of irrigable lands on the west mesa as are on the east mesa—which is probably not a permissible assumption because the lands of the west mesa are not as good as those of the east mesa—there would be only about 12,000 irrigable acres on the west mesa. The result is that of the total area some 300,000 acres on both mesas, more than 250,000 thereof are nonirrigable, whereas only 48,000 are susceptible of irrigation. The amount of water estimated by the noted report as required to irrigate the irrigable area is 12 to 15 acre-feet per acre per year (see question E, p. IV of the report).

This accentuates why California cannot and does not deny that if these 300,000 acres were not subjected to cultivation, there would be plenty of the water in question for use in that State. Even if only the 48,000 acres classified as irrigable were to be placed in cultivation, the exclusion of the 252,000 nonirrigable acres would eliminate all consideration of the sufficiency of the water supply to meet California's needs.

It is interesting to note that practically all of the lands of the east and west mesas are owned by the Federal Government. It follows that no private individual would be injured by the failure to place into cultivation such federally owned lands as are classified as nonirrigable.

In the course of my testimony at the hearings upon Senate Joint Resolution 145 and at the earlier hearings on S. 1175, I had occasion to point out that if California would refrain from her proposed program to put under irrigation some 300,000 unimproved acres of the Imperial east and west mesas, there would be an abundance of Colorado River water available for her uses, present and future, well within the quantities to which she restricted herself in her Self-Limitation Act.

Since the conclusion of the hearings on S. 1175, I have received a copy of the Economic Repayment Capacity Report for the Imperial east mesa, which report was prepared by the Department of the Interior and dated March 1948.

The report strongly etches and underlines the absolute unwisdom of an attempt to irrigate these areas. The following are self-explanatory excerpts from the summary and introduction prefacing such report:

"This report presents an analysis of the repayment capacity of lands classified as irrigable within seven potential development units on the Imperial east mesa division of the All-American Canal project in California. Irrigation water would be supplied from the Colorado River and delivered through the All-American and Coachella Canals. Of the 33,872 acres in the potential units, 32,440 acres are publicly owned lands withdrawn from entry. A complete discussion of the land classification of the area and anticipated farming problems is given in the East Mesa Land Classification and Development Report, dated April 1947. This report shows that 18,612 acres of the 33,872 acres in the potential units have been classified as irrigable, 3,782 acres are class 2 lands, and 14,830 acres class 3" (p. 1).

"Project development costs are estimated to average $615 an acre, which includes $390 for a distribution system and $225 for predeveloping the lands" (p. 1).

"On the basis of a budget analysis, it has been shown that class 3 lands would not be able to pay for the cost of constructing a distribution system" (p. 2).

"However, the class 2 lands are so interspersed with class 3 and 6 lands that their separate development would be physically impractical. If all 80-acre tracts of predominantly class 2 and 3 lands were developed, it is estimated that less than 20 percent of the total construction and predevelopment cost would be recoverable from the settlers" (p. 2).

"This classification shows a total of 35,900 acres of class 2 and 3 lands, of which 18,612 acres are located within seven potential development areas. Most of the lands tentatively classified as irrigable are of marginal character, and were designated as class 3. The class 2 and 3 lands not located within the development areas represent isolated tracts scattered throughout the mesa, which could not be served by a distribution system without the inclusion of a large acreage of class 6, nonirrigable land" (last paragraph, p. 3).

"It appears likely that the irrigation of any substantial acreage of the mesa lands would tend to enhance seriously the drainage difficulties in Imperial Valley unless additional drainage facilities are constructed" (last sentence of middle paragraph, p. 4).

"Most of the mesa is publicly owned land under reclamation withdrawal. Of the 33,872 acres in the potential units, 32,440 acres are publicly owned lands, withdrawn from entry. There are 1,219 acres of privately owned lands located within unit 1, 84 acres of State land, and 129 acres owned by the Southern Pacific Co." (bottom paragraph, p. 4).

As practically all of these lands are publicly owned and have been withdrawn by the Bureau of Reclamation, it is quite clear that the decision as to the development and irrigation of its own land is for the Federal Government, not California. What the decision should be is manifest; the report constitutes an answer and refutation of arguments for proceeding to develop and irrigate the mesas.

Assuming, however, that California would persist, in the face of these decidedly unfavorable factors, in a program to deliver Colorado River water to the 18,612 irrigable acres scattered among the seven areas potentially susceptible of development, and assuming a similar ratio of irrigable to nonirrigable acres on the west mesa (which is a most optimistic assumption), she can deliver the required quantity of water and nevertheless remain with ease within her limitation of 4,400,000 acre-feet.

I likewise noted in my final statement in the hearings on S. 1175 that the amount of Colorado River water wasting into the Salton Sea from Imperial Valley irrigation activities, namely, some 1,074,150 acre-feet, is almost enough to supply the entire central Arizona project. I request that there be admitted as evidence in this hearing the table which I submitted as exhibit A with my final statement at the earlier hearings on S. 1175, which table was furnished by the Bureau of Reclamation at Yuma, Ariz., and which shows the number of acre-feet of water flowing into the Salton Sea from the Imperial irrigation district and from the Imperial Valley in Mexico. I also request that the two photographs which I submitted, as exhibits B and C, with my final statement at such earlier hearings on S. 1175, be admitted in conjunction with my present statement as evidence in the present hearing.

Such table is as follows:

EXHIBIT A

Year	Imperial irrigation district		Imperial Valley in Mexico				Return flow to Salton Sea	
	Land irrigated	Water delivered	Land irrigated	Water delivered			From Mexico at boundary	Total including that from Mexico

[1] U. S. Bureau of Reclamation figures for delivery past drop No. 1 through All-American canal.

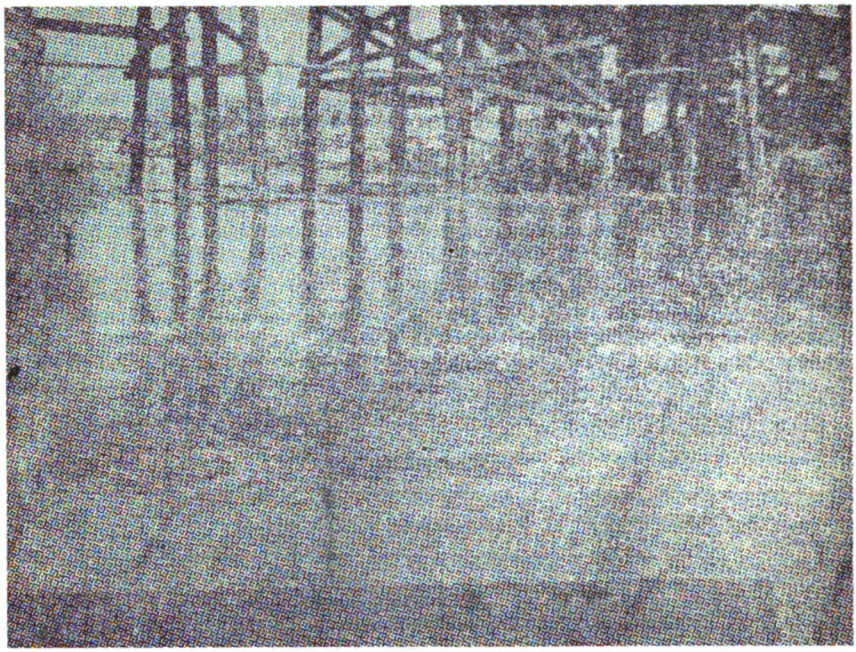
NOTE.—All figures are from Imperial irrigation district except as otherwise noted. Operation of All-American Canal began November 1940.

The photographs appear at pages 568 and 569 of said hearings on S. 1175. It is requested that, if possible, these photographs be inserted in the record at this point.

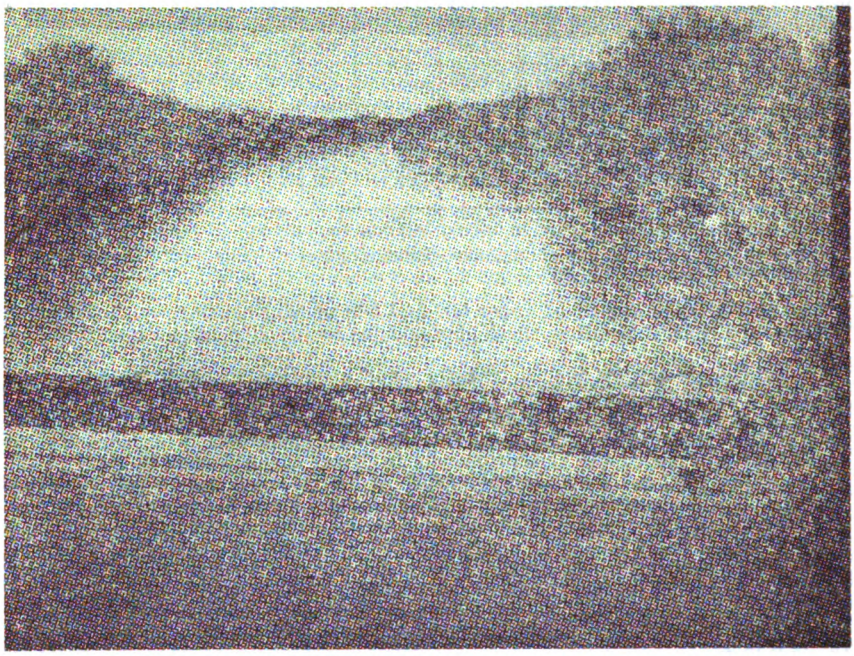
In conclusion, permit me to transfer your attention to another but closely related phase of the case.

On the final day of the hearings on S. 1175, California and Nevada introduced Senate Joint Resolution 145 before the Eightieth Congress. The ostensible or superficial purpose of the resolution was to direct the Attorney General to file in the Supreme Court a suit in the nature of interpleader, against Arizona and the various other interested States in the Colorado River Basin, for the purpose of determining the respective claims and rights to the use of Colorado River water. House Joint Resolutions 225, 226, 227, and 236, and H. R. 4097 were concurrently introduced in the House, they being the counterparts of Senate Joint Resolution 145 and having the identical objective, both ostensible and actual.

Senate Joint Resolution 145 was actively employed as an obstruction to the adoption of S. 1175; and under the circumstances there is no question but that the true purpose of the resolution was to delay or defeat the passage of legislation to authorize the central Arizona project.



New River carrying Imperial Valley waste water to Salton Sea, April 1947.



Alamo River carrying Imperial Valley waste water to Salton Sea, April 1947.

In May 1948 hearings were held in both branches of the Congress upon these resolutions. The Colorado River Basin States Committee opposed the resolutions on various substantial grounds, including that there is and cannot be a justiciable controversy until the authorization bill is passed.

Since the opening of the present session of Congress, California and Nevada have introduced Senate Joint Resolution 4 in the Senate and a considerable number of companion resolutions in the House, this time for the apparent purpose of consenting to the joinder of the United States as a party in any suit which may be commenced in the Supreme Court for the settlement of the rights to the use of the water of the Colorado.

The vice of these resolutions will be exposed before the respective committees hearing the same; and I therefore refrain from particularized discussion of such rsesolutions beyond stating that they, too, are merely more wolves disguised as innocent lambkins. They seek to divert or destroy the central Arizona project, that is their sole motivation.

I am confident that Arizona will win in the Supreme Court of the United States if and when there is presented to it a justiciable controversy within the jurisdiction of that Court and involving Arizona's rights under the Colorado River compact, the Boulder Canyon Project Act, the California Self-Limitation Act, and the Arizona water-delivery contract.

The delays incident to litigation prior to authorizing legislation, and the delays after conclusion of such litigation in favor of Arizona, and the delays attendant upon the presentation and passage of authorizing legislation thereafter, would be disastrous. California will no doubt oppose the passage of such legislation on some ground whenever it may be considered.

The people of Arizona by that time would have had to abandon their farms and seek other places; business houses and banks would have failed; and the economy of Arizona would have suffered to the point of disaster. It would be too late to cure the damage suffered by reason of such delays.

And then California would come in and state that they had in the meantime built up communities using Arizona's water, and that to permit Arizona to use its share of the water would dry up California communities; and in that manner California would attempt to defeat the moral, equitable, and legal rights of her neighbor and sister State.

Mr. MURDOCK. A quorum call has just been sounded. It is a straight "No quorum." That will mean, of course, that we cannot tarry long, now.

Can you summarize the matter, Senator? We would appreciate it.

Senator MCFARLAND. I wonder if you will meet this afternoon? If I am to give you a brief oral summary of what the project is all about, it would take me not as long as the time already consumed before the committee this morning; but I would like to have 20 or 30 minutes, which would probably be longer than you would want to wait now.

Mr. D'EWART. Mr. Chairman, I would like to hear the Senator in full, and have him submit himself to questions. I would prefer that he come back when we have more time.

Mr. CRAWFORD. Also, Mr. Chairman, I cannot see why we could not agree some way, so that Senator McFarland does not have to come over here and sit for an hour or two waiting to be called. Let him come over here, appear before the committee, make his statement, answer our questions, and then go back to do his work.

Senator MCFARLAND. That is all right. I was glad to listen to my good friend, Mr. Engle. I want to answer some of the things that he said.

Mr. MURDOCK. Off the record.

(Discussion off the record.)

Mr. MURDOCK. We will recess for 15 minutes or so, and then return.

(Thereupon, at 11:15 a. m., Wednesday, March 30, 1949, a recess was taken until 11:45 a. m. of the same day.)

AFTER RECESS

(The subcommittee reconvened pursuant to recess.)

Mr. MURDOCK. The subcommittee will come to order, please.

Our witnesses and guests from out of town will appreciate the fact that the life of a Congressman is pretty hectic.

The bill we have up on the floor is an important bill for all westerners, and most of the members of this committee are westerners. I think there will be some members of the committee returning, in spite of the fact that they are tremendously interested in what is going on on the floor of the House, especially a little later.

However, we simply cannot ask the Senator to run away from his busy duties to come over to talk to us.

Senator, I wish we had a full attendance of the committee. The quality is here in those present. We would like to have you summarize your statement in your own way.

Senator MCFARLAND. Thank you, Mr. Chairman. I appreciate your coming back.

I think it is well, when we talk of one of these projects, to know a little bit concerning the country about which we are talking; although I am sure that most of the members of this committee are well informed as to central Arizona.

I would like to point out the territory which comprises the central Arizona project.

We have under cultivation in central Arizona approximately 725,000 acres of land. That is, we have had at least approximately that number of acres under cultivation. That project consists of lands in Maricopa County, which are the lands along here in the green [indicating].

There are, in Maricopa County and in here [indicating] under cultivation approximately 450,000 acres. Of that amount 242,000 is in what is called the Salt River Valley Water Users' project. That land is irrigated partly by gravity and partly by pump water.

This project in Maricopa County extends clear down to Gila Bend and includes that land under the Gillespie project, irrigated from the Gillespie Dam and irrigated partly by gravity and partly by pump

With regard to the rest of the project lands, some of them are irrigated partly by gravity and partly by pump water, and some entirely by pump water.

Then we have over in this country here [indicating], the San Carlos project and adjoining areas, containing approximately 200,000 acres of land in Pinal County, altogether. One hundred thousand acres of that land is irrigated partly by gravity and partly by pump water; and the remainder of it is irrigated chiefly by pump water.

Over in the Safford Valley [indicating] we have some 40,000 acres of land which is irrigated primarily by gravity, but is supplemented by pump water.

This project would include some land in New Mexico, a little over 8,000 or something like 8,000 acres, at least, which has been irrigated or which is now being irrigated.

Mr. MURDOCK. Senator, will you lift up your voice a bit and make it quite clear that New Mexico is in on this project. I want the former Governor to hear that.

Senator MCFARLAND. Thank you.

Our water supply consists, as I said, of gravity and pump water. The supply of gravity or surface water is approximately 1,676,600 acre-feet of water, which is use and reuse water.

We have in our projects, first, the Roosevelt Dam. Below that we have three other dams.

The Roosevelt Dam impounds approximately 1,637,000 acre-feet of water [indicating].

Then we have the Horse Mesa Dam, the Mormon Flat Dam, and Stewart Mountain Dam below that; and two dams on the Verde River, Horseshoe Dam, and Bartlett Dam. The Verde empties into the Salt along about this point [indicating].

The total storage of those dams is approximately 2,000,000 acre-feet of water.

On the Gila River we have the Coolidge Dam which has a storage capacity of approximately 1,200,000 acre-feet of water.

As you will note, we have plenty of storage capacity for our projects, but we do not have sufficient water for the projects.

Between 1940 and 1944 we pumped an average of 1,163,000 acre-feet of water annually.

According to the Bureau of Reclamation report we overpumped an average of 468,000 acre-feet of water per year. In other words, we were exhausting our underground water to that extent.

Even with that overpumping there was idle during that time approximately 105,000 acres of land which had previously been irrigated but which had to lay out because of the lack of water supply.

Since that time the supply has been even worse.

During the hearings in May 1947 Mr. K. K. Henness, agricultural agent in Pinal County, testified that at the time of those hearings there was then only one-fourth enough water for the irrigated land in the San Carlos irrigation project, which comprised 50,000 acres of land belonging to white owners and 50,000 acres of Indian lands. He testified that the allotment was then only eighty-five one hundredths of an acre-foot of water.

On the Salt River Valley project Mr. Corbell, of the Salt River Valley water users, testified at that time there was apportioned 2 acre-feet of water annually on that project. Just what did that mean?

The duty of the water, as estimated by the Bureau of Reclamation, now is 4 acre-feet delivered at the head gate. It meant that in the San Carlos project three-fourths of that land had to lay out or that any larger portion would not be adequately irrigated. It meant that in the Salt River Valley project one-half of that land had to lay out or that all could not be adequately irrigated. That spelled about the same thing.

It was probably better for the farmer to cultivate half of his land than to try to irrigate all of it with half enough water.

I would like to explain to you, before going into the other features of this project, just why we are short of water. It is due to two things.

The irrigation in central Arizona dates back to the 1860's, as I recall it, from the trial of water cases when I was on the bench in my State. There are water rights dating back at least to 1867.

The first dam of major importance that was built was the Roosevelt Dam. That was started in 1903. At the time that these early projects were started in Arizona, the duty of water was then estimated to be

3 acre-feet delivered at the head gate. Later on, with new developments in irrigation, we went to the point where we had multiple crops, and we raised crops which were not raised in other parts of our Nation, or else raised them when they could not be raised in other parts of our Nation, thereby supplying valuable foods which were needed. This proved to be very profitable but it raised the duty on water to 4 acre-feet delivered to the head gate.

Then, the shortage was due partly to the fact that we first started out pumping, because some of our lands were water-logged. Then, with the increase in efficiency of pumping and lowered power costs, it was found to be profitable. So we have come to the point that we are overdeveloped in our State, and according to the report of the Bureau of Reclamation, which is referred to in my prepared statement, if this project is not authorized and built it will mean that 226,000 acres of land which have previously been irrigated will have to go out of cultivation permanently.

According to the population reports of 1947, the population of the agricultural areas of my State was 504,000 people. Estimating on a percentage basis, if you take 226,000 acres of land out of cultivation, it means that 150,000 people will have to be looking for homes elsewhere.

This is a "rescue project" and it has been so described by the Bureau of Reclamation. If we do not receive this aid these 150,000 people will be coming to some of your States, or some place, to find homes, because they will have lost their life's earnings which they have built up; and you will find that the banks will be closing their doors, and the business establishments will be bankrupted or suffer serious loss. You will find that there is a serious loss to the revenue of the United States in various forms, including taxes, income taxes and such, which come from that area at this time.

All of this testimony will be developed before you in detail, and I do not want to take your time now to describe it.

This project has been described by the chairman. It will start out with the building of Bridge Canyon Dam and then with the aqueduct from Lake Havasu, which will take water down to the main canal and thence to Granite Reef. From Granite Reef a canal will take water to the San Carlos project, at approximately the Ashurst-Hayden Dam, then by canal on down to Picacho Reservoir, and then on down to the flood plains of the Santa Cruz, which would include lands in the Picacho country.

Mr. POULSON. Senator, is that Hoover Dam? What is the direction of that map?

Senator MCFARLAND. Here is the Hoover Dam, which is practically north here [indicating].

Mr. POULSON. I see. I think that is the Hooker Dam below, is that right?

Senator MCFARLAND. Yes; this is the Hooker Dam, to be built in New Mexico [indicating].

Mr. POULSON. I see.

Senator MCFARLAND. These lands would be served up here with supplemental water, by trading water for the Colorado River water, which would be brought down in this area [indicating], thereby releasing the duty on this land in order to give the people up here, as

in the Safford and Duncan Valley, more supplemental water for their lands; and so in New Mexico and on the San Pedro, and in other areas.

Mr. MURDOCK. Senator, may I interrupt with an observation and possibly a question?

Senator MCFARLAND. Certainly.

Mr. MURDOCK. I just wanted to say that the Senator is well informed legally and in every other respect with regard to the water rights, having struggled with this for a long time.

Do you mean to say, Senator, that by an exchange of water we are going to revivify all the agricultural counties of the State, if we can get the water that the bill asks for?

Senator MCFARLAND. I believe the Bureau of Reclamation estimates there would be at least 672,000 acres which would get supplemental water, of this approximate total of 725,000 acres; and others have estimated it would be the full 725,000. In that way we would save the whole economy of the State of Arizona. It is just that important to our State.

Now, we might well divide our discussion of this bill into three subheads. One would be, of course, the need for water which I have just discussed. The second would be the feasibility of the project. The third would be the availability of water.

I presume, Mr. Chairman, that you have the project reports available for the committee and that they will probably be printed in the record?

Mr. MURDOCK. That is right.

Senator MCFARLAND. I would call your attention to page 17 of my statement, which page deals with the feasibility of the project. You will note that the project will cost some $738,408,000.

That does not include the tunnel from Bridge Canyon down to the aqueduct, which was described by the chairman. The building of the tunnel will be postponed until economic conditions justify it.

The cost of construction is so high at this time that the Bureau of Reclamation felt that it would not be feasible now to build the tunnel. That can be left over until a day when it is definitely proved that the amount of revenue from the electricity used in elevating this water 985 feet would build the tunnel.

Mr. MURDOCK. Senator, I think that needs to be emphasized.

The entire construction authorized here is not to be done immediately. The object is to get the water where it is so terribly needed as soon as possible, but the more expensive parts of the project are deferred until economic conditions justify them.

Senator MCFARLAND. That is correct. It would take years and years to build all this project. For example, it calls for the building of a dam at Coconino Dam site, on the Little Colorado, and one at the Bluff Dam site, in Utah.

These dams are dams, all of which should be built and will be built, whether the central Arizona project be authorized or not. This is work that needs to be done for the protection of the lower projects, and on account of the need for electrical energy in that area.

Mr. POULSON. Is this tunnel necessary?

Senator MCFARLAND. That tunnel is not shown here, but the tunnel would come out, Mr. Congressman, approximately right above the

91190—49—ser. 11, pt. 1——4

Bridge Canyon Dam and would come right down to the Big Sandy Wash to about this point [indicating] and then by open aqueduct would intercept this down here [indicating].

Mr. POULSON. Before that is built where would you bring the water?

Senator MCFARLAND. By these four pumping plants here, described as 1, 2, 3, and 4, it would be lifted out of Lake Havasu and brought through this aqueduct here [indicating].

The engineers have stated in their report for the Bureau of Reclamation, that the project is engineeringly feasible in that there are no physical obstructions that would be encountered during its construction that could not be overcome.

The project is also financially feasible under the provisions of S. 75 and under the provisions of the bills which you are considering here, in that it could be reasonably expected to repay the reimbursable portions of its construction costs well within the useful life of the project.

It has been found that $4.75 per acre-foot, which local interests have indicated they are willing and able to pay, would more than pay the operation and maintenance costs and replacement costs allocated to irrigation.

It has also been found that a charge of 15 cents per 1,000 gallons for municipal water would fully repay all the costs allocated to that purpose, and would be equally advantageous to the municipal water users.

The power rate necessary to accomplish a repayment of all reimbursable costs assigned to be repaid from power revenues would be very reasonable. Such low-cost power would represent a distinct advantage to power users in that area.

The project represents a sound investment for the Nation, in that the tangible benefits of the project would exceed the total cost to the Nation in the ratio of 1.63 to 1.

In addition, there would be innumerable intangible benefits accruing to the State of Arizona and to the Nation as a whole, as a result of the central Arizona project.

Now, the next feature of the project which we should discuss is a matter which has to be determined by Congress as it always does before a project is authorized. That is the one touched upon by Congressman Engle; and that is the availability of water for the project.

When we speak of the availability of water one must remember that there is the separate item of physical quantities which may be available and the distinct but related item of legal entitlement to the use of water.

I say with positive assurance that there is adequate water in the Colorado River fully to supply the central Arizona project, and that Arizona is clearly entitled as a matter of right and justice to the exclusive use of that water. Moreover, such use will not interfere with or burden any other right of use existing in law.

The long-term (1897–1943) average annual flow of the Colorado River under virgin conditions at Lee Ferry was 16,270,000 acre-feet. At the international boundary it was 17,720,000 acre-feet. Those are the figures that are given to us by the Bureau of Reclamation, and I believe they are pretty well accepted by everyone, except as to the dis-

pute as to some constructions, in regard to where the use of the water should be made, which I will discuss later.

I will not go into this in further detail, because I believe, as I say, that it is pretty well settled and that the physical water is available.

Mr. MURDOCK. Senator, we shall have representatives from the Bureau, also, to appear.

Senator MCFARLAND. No doubt, you will, Mr. Chairman. I am only attempting to give to the committee a brief summary of the evidence which has been presented before our committee in order that you will have a little understanding, maybe, of what the witnesses will testify to when they come here.

I am not trying to go into detail on any of these matters. Of course, physical feasibility and availability involve data which will be testified to by the engineers on both sides.

Mr. MURDOCK. I agree with you, Senator, that there are two phases to availability; physical availability as well as legal availability. We are convinced that there are both for this bill.

Senator MCFARLAND. Mr. Chairman, we now come to the question of the availability of water, or Arizona's right to water as a matter of law.

This phase of the case may be much more readily presented and grasped by a review of matters leading to our present situation.

In the year 1922 the States of the geographical area described in the testimony as the Colorado River Basin were striving among themselves to arrive at an agreement leading to the beneficial use of the waters of the Colorado River for irrigation and the generation of electric power. The delegates from these States proposed the now renowned Colorado River compact. A controversy arose over the inclusion of the waters of the Gila River within the Colorado River system, and hence with those to be apportioned by the compact, a move unalterably resisted by the Arizona delegation because the waters of the Gila had long been put to beneficial use by the citizens of that State, and because the waters of the Gila enter the Colorado at a point so southerly as to prevent the enjoyment thereof by any of the basin States other than Arizona.

In fine, the Gila was no part of the Colorado waters which were the proper subject of apportionment.

The Arizona delegates were agreeable, however, to the provisions of article III (a) of the compact, which proposed the annual apportionment to the upper basin, and a like apportionment to the lower basin, of 7,500,000 acre-feet of water from the Colorado River if the waters of the Gila were reserved for Arizona.

As a consequence, and in order to compensate Arizona for the inclusion of the Gila waters in the Colorado River system, the delegates agreed upon article III (b) of the compact, which reads as follows:

(b) In addition to the apportionment in paragraph (a), the lower basin is hereby given the right to increase its beneficial consumptive use of such waters by 1,000,000 acre-feet per annum.

This quantity of 1,000,000 acre-feet per annum corresponds to the then-estimated annual flow of the Gila River at its mouth, where it empties into the Colorado.

The history of the meaning and purpose of article III (b) of the compact is related in the testimony of Mr. Ralph Meeker, who was,

during the negotiation of the Colorado River compact at Santa Fe, the engineer-adviser for the State of Colorado. He was present at the compact sessions, and of his own personal knowledge is familiar with the background of the compact. His testimony is found from pages 473 to 481 of the record of the hearing on S. 1175.

I call particular attention to pages 475 and 476 thereof, where Mr. Meeker makes it plain that it was understood by all the negotiators that 1,000,000 additional acre-feet were apportioned to the lower basin to be used in Arizona, because the Gila River was included in the compact. He also quoted from the report of Frank C. Emerson, commissioner for the State of Wyoming for the Colorado River compact, and from a citation from the Colorado River compact, by Reuel Leslie Olson, showing that this was understood by L. Ward Bannister, special representative for Colorado at the negotiations.

Likewise, in support of the identical history and meaning of this article III (b), I refer to the testimony of Mr. Charles A. Carson, now chief counsel for the Interstate Stream Commission of Arizona, wherein he incorporates testimony of the Honorable Thomas E. Campbell, former Governor of Arizona, and also incorporated the testimony of Mr. W. S. Norviel, Arizona's commissioner at the compact sessions as well as that of Mr. C. C. Lewis, another of Arizona's representatives, all of such testimony demonstrates that 1,000,000 acre-feet were intended to be apportioned to the lower basin for use by Arizona. The testimony of these individuals is based upon personal participation and direct personal knowledge.

I would also call your attention to the fact that there will be introduced here, and the witnesses will testify, that this was the understanding of Hon. Herbert Hoover at that time. I am not going into this testimony in detail. I am merely pointing it up to you because you will hear it at first-hand later on from the witnesses.

Mr. MURDOCK. I am sure, Senator, that that part of it will certainly be pointed up in this hearing.

Senator MCFARLAND. It was for this reason that Arizona's compact representatives were willing to sign the compact at that time.

The Colorado's uncontrolled flow proved increasingly harmful, as well as wasteful of potential benefit.

California's anxiety to avoid floods along the neighboring California lowlands, and to procure water and electric energy for her coastal communities, made her especially anxious to harness and utilize the Colorado. Further interstate negotiations having proved unavailing, congressional action for the construction of Boulder Dam was inaugurated. This led to the passage of the Boulder Canyon Project Act. I would like to call your attention to the testimony of my colleague, Senator Hayden, who testified at the hearings on Senate Joint Resolution 145 and gave some of the congressional history of the Boulder Canyon Project Act, and how it was filibustered from time to time until the present provisions of the act were agreed to.

I believe that that testimony will appear very interesting and valuable to the members of this committee as it is the testimony of one who was here and took an active part in the debate and controversy at that time.

Mr. MURDOCK. May I interrupt you just a moment, Senator?

Was not the entire effort of the moment, from the intermountain

country, an effort to write in a limitation so that they would be protected in future years? Was that not the effort of men like Pittman, of Nevada, Hayden, of Arizona, and Ashurst?

Senator MCFARLAND. The chairman is absolutely correct, and I will come to that in just a moment.

I would like to call attention to the fact that the act, by its own terms, section 4 (a), was to become effective upon either of two conditions. These are the conditions which the chairman had in mind, I am sure.

The first of these was ratification of the Colorado River compact within 6 months by all seven of the States affected.

The second was ratification of the compact by six of the interested States, including California, and the irrevocable and unconditional enactment by the legislature of the latter State of a statute which, and I now quote the exact language of said section 4 (a):

Shall agree irrevocably and unconditionally with the United States and for the benefit of the States of Arizona, Colorado, Nevada, New Mexico, Utah, and Wyoming—

May I stop here to say that all of the States were then afraid of the power of California and they wanted something to protect themselves, just as the chairman has pointed out; and they had reason to be afraid.

Mr. MURDOCK. Yes. When we talk about the lion and the lamb lying down together, there is such a thing as the lamb being inside the lion. And that could be true if there were six lambs.

Senator MCFARLAND. I thank you. I continue:

As an express covenant and in consideration of the passage of this act that the aggregate annual consumptive use (diversions less returns to the river) of water of and from the Colorado River for use in the State of California, including all uses under contracts made under the provisions of this act and all water necessary for the supply of any rights which may now exist, shall not exceed 4,400,000 acre-feet of the waters apportioned to the lower basin States by paragraph (a) of article III of the Colorado River compact, plus not more than one-half of any excess or surplus waters unapportioned by said compact, such uses always to be subject to the terms of said compact.

California promptly enacted a statute sometimes spoken of as the Self-Limitation Act, the pertinent part of which is verbatim with the language just quoted from the Boulder Canyon Project Act.

In view of the extremely liberal quantity of water specified as a maximum, and in view of her need for flood control, water, and electrical energy, California's willingness to adopt her Self-Limitation Act is quite understandable.

Section 4 (a) of the Boulder Canyon Project Act also unequivocally voiced the permanent intention of the Congress to define and limit California's maximum rights, and California irrevocably and unconditionally agreed to that limitation.

Having limited California to 4,400,000 acre-feet per annum of the 7,500,000 acre-feet apportioned by article III (a) of the Colorado River Compact, as I have already shown, and having further limited California to half of any excess or surplus waters unapportioned by that compact, Congress further provided that:

The States of Arizona, California, and Nevada are authorized to enter into an agreement which shall provide (1) that of the 7,500,000 acre-feet annually apportioned to the lower basin by paragraph (a) of article III of the Colorado

River Compact, there shall be apportioned to the State of Nevada 300,000 acre-feet and to the State of Arizona 2,800,000 acre-feet for exclusive beneficial consumptive use in perpetuity——

Mr. MURDOCK. Is that figure 2,800,000 acre-feet?

Senator MCFARLAND. Yes, that is correct. [Continuing:]

and (2) that the State of Arizona may annually use one-half of the excess or surplus waters unapportioned by the Colorado River Compact and (3) that the State of Arizona shall have the exclusive beneficial consumptive use of the Gila River and its tributaries within the boundaries of said State, and (4) that the waters of the Gila River and its tributaries, except return flow after the same enters the Colorado River, shall never be subject to any diminution whatever by any allowance of water which may be made by treaty or otherwise to the United States of Mexico * * *.

Mr. Chairman and members of the committee, the foregoing factors plainly define the congressional purpose. Congress manifestly intended that of the 7,500,000 acre-feet of Colorado River water apportioned by article III (a) of the compact, Nevada is to receive 300,000; Arizona not less than 2,800,000; and California not to exceed 4,400,000. It is also clear that Arizona should receive, in addition, all the waters of the Gila River, both because of the previously mentioned insertion in the compact of its article III (b)—which apportions 1,000,000 acre-feet per annum to the lower basin to compensate Arizona for inclusion of the Gila in the Colorado River system—and because of the specific authorization in section 4 (a) of the Boulder Canyon Project Act of the agreement whereby Arizona is to receive all the water of the Gila and its tributaries within Arizona's boundaries.

From the mere reading of the language of the Boulder Canyon Project Act it is evident that Congress proposed to California the terms of a contract for the explicit benefit of Arizona, Nevada, and the other interested States.

The contract thus proposed was as follows: Of the 7,500,000 acre-feet of Colorado River water apportioned to the lower basin by article III (a) of the compact, California should have not to exceed 4,400,000, and that California could use not more than one-half of any water in excess of or surplus to the water apportioned by the compact, which might be available in the lower basin.

Mr. MURDOCK. May I ask you something there, Senator?

Senator MCFARLAND. Yes.

Mr. MURDOCK. There was an act of the California Legislature in March of 1929 that limited California to 4,400,000 acre-feet of the III (a) water?

Senator MCFARLAND. That is correct.

Mr. MURDOCK. Is it not possible for a statute to be repealed?

Senator MCFARLAND. No; not that statute. I will come to that, Mr. Chairman. It would not be possible.

California, when they entered into that agreement and passed that act, entered into a contract with the United States for the benefit of these other States; and I want to say to you that that contract is just as binding upon California as any compact which might be adopted and ratified by the Congress of the United States.

Mr. ENGLE. Will the gentleman yield?

Senator MCFARLAND. Yes; I yield.

Mr. ENGLE. Did you state, Senator, that California, by passing the

Self-Limitation Act, had entered into a contract with the United States Government?

Senator McFARLAND. It amounts to that.

Mr. ENGLE. Do you think it is right for one party to a contract to interpret it?

Senator McFARLAND. I am going to come to that in just a moment.

Mr. ENGLE. The point I am making, Senator, is this: If your statement is correct that California, by passing its Limitation Act entered into a contract with the United States Government—and I want you to comment on this later—then what right has this Congress, representing the Federal Government, to interpret the contract?

Senator McFARLAND. If I may, I will answer that. I could answer it right now, but I desire to just make one more statement and then I will answer it.

California, by adopting its Self-Limitation Act, unequivocally and unconditionally accepted this proposal and thereby completed a binding contract. As California may not have more than 4,400,000 acre-feet of the water apportioned by article III (a) of the compact, the balance is for Nevada and Arizona; and Congress has, in terms, indicated its intent that Nevada have 300,000 acre-feet and Arizona not less than 2,800,000 acre-feet. This intent has been executed.

The water involved in article III (b) of the compact, not only is "apportioned" water, but is, in effect, apportioned to Arizona for the reasons shown.

The Colorado River water which is available in the lower basin in excess of or surplus to that apportioned by articles III (a) and III (b) of the compact is to be equally divided between California and Arizona.

The contract between the State of California and the United States—for the benefit of the States of Arizona, Colorado, Nevada, New Mexico, Utah, and Wyoming—just as completely settled California's rights as any compact could do. Congress, by approving in advance a compact between Arizona, California, and Nevada, definitely gave its interpretation of the California Self-Limitation Act, which is the interpretation Arizona now relies upon; and California, by adopting the act, accepted and agreed to this interpretation.

This is the point that answers your question, Congressman. Congress did give its interpretation of that Self-Limitation Act. If I may say this, the witnesses here will state that the tri-State compact which authorized by the Project Act, was never entered into; but, Mr. Chairman, and Congressman Engle, while the tri-State compact was never entered into, the Project Act definitely amounted to an interpretation of Congress as to what that Self-Limitation Act meant. Otherwise it would have been futile for Congress to have provided for a compact if that amount of water were not available.

When Congress provided for that compact to apportion 2,800,000 acre-feet of water for Arizona, plus one-half of the excess or surplus, and 300,000 acre-feet of water for Nevada, and gave to Arizona the Gila water, Congress meant that that was its interpretation of the California Limitation Act, that that amount of water was available to be distributed between Arizona and Nevada.

Surely, California did not have to accept this Self-Limitation Act. They did not have to enact it into law, but they did do it. When they

did it they necessarily enacted it with the interpretation that was adopted by Congress in the Boulder Canyon Project Act. That interpretation is just as binding as any other part of the act.

Mr. ENGLE. Senator, will you yield for a question?

Senator MCFARLAND. Certainly.

Mr. ENGLE. Assuming but not agreeing that the Boulder Canyon Project Act is an interpretation of the basic compact by Congress——

Senator MCFARLAND. Pardon me. May I just correct you right there?

Mr. ENGLE. Yes.

Senator MCFARLAND. The Boulder Canyon Project Act was more than just an interpretation of the Colorado River compact. The Project Act was an interpretation of the Self-Limitation Act. While the provisions of the Boulder Canyon Project Act were a legislative interpretation of the rights of the States under the compact, the point I am now trying to make is that Congress specifically interpreted the California Self-Limitation Act before the enactment thereof by the advance approval of a compact to be thereafter adopted by the lower-basin States for the division of the remainder of the water not embraced in the Self-Limitation Act. As noted in my prepared statement, Senator Hayden has fully explained the reason why Arizona ceased her filibuster in opposition to the Boulder Canyon Project Act. Arizona did so because of the compromise by which Congress required California to enter into a statutory contract of Self-Limitation, for the benefit of the other States. In doing so, Congress necessarily placed its interpretation upon the Colorado River compact; but Congress purposely placed its interpretation not only on the compact itself, but upon the Self-Limitation Act, which Congress required California to accept so as to eliminate future controversy.

Pardon me for interrupting. Go right ahead.

Mr. ENGLE. Assuming, but not agreeing, that the act of Congress placed an interpretation on the California Self-Limitation Act—which, as I understand it, embodies in identical words the language set forth in the Boulder Canyon Project Act——

Senator MCFARLAND. That is correct.

Mr. ENGLE. Is it your belief, then, that the language of section 4 (a) defining consumptive use as "diversions less returns to the river" is a definition of beneficial consumptive use under the compact?

Senator MCFARLAND. It is definite, in my opinion, that Congress had in mind the depletion; that consumptive use was the amount of water that each State burns up by use, and thereby reduces the main flow of the Colorado River. If they had had any other interpretation in mind, definitely there would not have been that water available for this other compact.

Mr. ENGLE. The point I am getting to, Senator, is this: The ax cuts both ways. If you contend that there is a definition and an interpretation of the California Limitation Act, then the language in section 4 (a) of consumptive use as "diversions less returns to the river" would, in effect, throw out the interpretation now set up in the upper Colorado River compact and would also, it seems to me, apply with equal force in the lower section.

Senator MCFARLAND. Congressman, they were talking about mainstream water, were they not?

Mr. ENGLE. I am not so sure, because the compact is a division of water in the basin, and not in the streams.

If you set up a definition in an act and fail to specify that it is main stream water, rather than to the basin—correct me if I am in error—my understanding is that the basic Colorado River compact divides the water in the basins, not in the streams but in the basins.

What I am driving at is this: That you cannot claim the benefits of interpretation and not take the detriments of the interpretation.

Senator MCFARLAND. We are not trying to. That will be thoroughly developed. There is no question but what, when you talk about the main stream water, the interpretation becomes very plain.

However, that is not the interpretation which California is trying to put on us and to put on the Upper Basin States here. They would try to charge us with all the water that falls in the basin, whether it would have reached the Colorado River or not. Congress could not have been talking about anything but main stream water, because that was the only water authorized to be contracted, and the only water California could get, because she does not have a tributary. It could not have been referring to anything other than the main stream water for California.

Mr. ENGLE. Senator, I do not want to interrupt the continuity of your statement.

Senator MCFARLAND. That is perfectly all right.

Mr. ENGLE. I just wanted to say that when you speak of Congress making an interpretation of the Limitation Act of California or of the Boulder Canyon Project Act, that you cannot take an interpretation for its benefits and decline it for its detriments. I just want to throw that out as something for the committee to consider.

Senator MCFARLAND. I am perfectly willing for them to consider it, because I think the interpretation is perfectly plain as to meaning.

I shall try to develop this aspect a little bit more fully in my statement, that there could be no misunderstanding about it at all.

As I say, the interpretation was made there in the Boulder Canyon Project Act. If they had not made that interpretation, the water would not have been available.

As I said, that contract between the State of California and the United States, for the benefit of the other States, has just as completely settled California's rights as any compact could do. No one here would state that you should start a lawsuit now, immediately, to settle the rights and interpret the upper basin compact which has been made.

Arizona, relying on the protection thus afforded her, adopted and ratified the Colorado River compact. A large number of the people of Arizona believed that Congress had not required California to limit herself to a small-enough quantity of waters of the Colorado River. However, Arizona had little choice, as the rights of the States were well defined in the Boulder Canyon Project Act. She has entered into a contract with the Secretary of the Interior, which contract calls for delivery of 2,800,000 acre-feet of Colorado River main stream water per year, plus one-half of the excess or surplus water unapportioned by the compact which may be available in the lower basin, less one twenty-fifth of such surplus water, to be used by Nevada.

It is significant that the Department of the Interior, in a regulation

promulgated by it under date of February 7, 1933, authorized the proffer to Arizona of a water-delivery contract which contained a provision giving to Arizona 2,800,000 acre-feet of main stream Colorado River water and all of the water of the Gila.

I do not want to read that contract in full. It will be elaborated on by witnesses during this hearing. However, it showed that the Secretary of the Interior thoroughly understood the meaning to be given these instruments.

Mr. MURDOCK. What was the date of that?

Senator MCFARLAND. That was submitted on February 7, 1933.

Mr. POULSON. Mr. Chairman, will the Senator yield?

Senator MCFARLAND. Certainly.

Mr. POULSON. You stated that the Federal Government or Congress has the right to interpret the contract between the State of California and the Government.

If two parties enter into a contract, does not the other party have the right of interpretation, also? In other words, would the State Legislature of California have the right to interpret that contract, to put us back in the same position again?

Senator MCFARLAND. No. What I said was that the Congress did interpret that Self-Limitation Act; and, having interpreted it and it being part of the same act, California, when they adopted it, accepted the interpretation of Congress.

Mr. MURDOCK. I have just been notified that the general debate in the House has ended and they are about to begin to read the bill.

Senator MCFARLAND. In view of that, I will close my remarks with a brief summary of these matters. How long will it be, Mr. Chairman?

Mr. MURDOCK. You go right ahead, Senator.

Senator MCFARLAND. I will close it just as fast as I can, in a few words.

California admits that she is bound by the California Self-Limitation Act and is not entitled to more than 4,400,000 acre-feet of III (a) water and one-half of any excess or surplus water unapportioned by the compact. However, in an effort to procure more so-called surplus waters for herself, thereby in actuality reducing the quantity of apportioned water to which Arizona is rightfully entitled, California has elected to pursue a stratagem based largely upon two patently strained and inequitable constructions of the wording of the Colorado River compact. In a general way, these false constructions may be stated as follows:

The water described in article III (b) of the compact is water unapportioned by the compact.

A definition of "beneficial consumptive use" which would charge Arizona with the total water reaching the Gila watershed rather than with the amount by which she depletes the waters of the Colorado River at the mouth of the Gila.

Neither of these contentions is supported by the intentions of the framers of the compact or by those of the Congress.

As to the contention that the water embraced in article III (b) of the compact is not apportioned, and therefore falls within the class of "surplus or unapportioned" water of which California may have half under the provisions of the Boulder Canyon Project Act,

enough has been said above to demonstrate its utter fallacy. Congress in effect has indicated its intention as to the division of the waters apportioned by article III (a) of the compact; i. e., California, not more than 4,400,000; Nevada, 300,000; Arizona, not less than 2,800,000; total, 7,500,000. As shown, the ultimate purpose of article III (b) was to apportion the waters of the Gila to the lower basin for use by Arizona and Congress explicitly recognized this apportionment by express language in the Boulder Canyon Project Act.

It is therefore clear to anyone who cares to see that the waters upon which article III (a) of the compact is effective, the 7,500,000 acre-feet of the Colorado River water, and those upon which article III (b) is operative, in final effect the 1,000,000 acre-feet of the Gila which was thought to be substantially all thereof, are "apportioned water." The excess or surplus waters above such apportioned water are for equal division between California and Arizona, with the small reservation for Nevada previously noted.

The record abounds with proof, both within the context of the compact and of the project act, as well as in collateral circumstances, that this is the true and just situation.

I invite attention to the testimony of Judge Clifford H. Stone, director, Colorado Water Conservation Board and commissioner for Colorado for the Upper Colorado River Basin Compact Commission, whose ability, impartiality, and knowledge of those problems are generally recognized. His testimony appears on pages 513 through 521 of said hearings on S. 1175.

Judge Stone demonstrated that the water embraced in article III (b) of the compact is definitely "apportioned water," and that the Supreme Court of the United States has so held in the case of *Arizona* v. *California* (292 U. S. 341). He points out that the compact is clear and unambiguous, within its own four corners, as to the apportionment of water; that the will of the legislatures which ratified the compact is paramount; and that such will cannot in law be now thwarted through collateral efforts and documents.

At page 517 Judge Stone quotes the following language from a letter from the Honorable Herbert Hoover, who was the chairman of the Colorado River Compact Commission:

> Due consideration is given to the needs of each basin, and there is apportioned to each 7½ million acre-feet annually from the flow of the Colorado River in perpetuity, and to the lower basin an additional million feet of annual flow, giving it a total of 8½ million acre-feet annually in perpetuity.

That is what Herbert Hoover said, Mr. Chairman.

I could go ahead here and quote other testimony, but for the sake of brevity I will only refer to the quotations I have given in my statement.

I would just like to call your attention to these words of Herbert Hoover, in closing upon this point:

> I do not think there is any change in the basis of division as the result of the difference in language in articles III (a) and III (b). The two mean the same thing. By reference to article II (f) it will be seen that Lee Ferry, referred to in III (d), is the determining point in the creation of the two basins specified in III (a).

The second of the devices by which California hopes to gain additional water involves its own definition, highly beneficial to that State, of "consumptive use."

The question is whether the quantity of water put to "beneficial consumptive use" along the course of a tributary to the Colorado River is equivalent to the amount of depletion of the virgin flow of such tributary at the confluence thereof with the Colorado River.

California applies its definition of such consumptive use to Arizona by insisting that Arizona is chargeable with all the water flowing in the Gila watershed which does not reach the Colorado. As California has no real tributary to the Colorado River and contributes practically no water to the main stream thereof, her definition is therefore peculiarly beneficial to herself and detrimental to Arizona and the upper basin States.

It is Arizona's theory that we are chargeable only with the amount of water by which we deplete the main stream of the Colorado River. That is the only amount which affects the other States.

The Gila River, as has been explained, admittedly empties into the Colorado at a point which prevents use of the Gila waters by any other State. The virgin flow of the Gila at such confluence is now estimated at approximately 1,270,000 acre-feet per annum, although when the compact was drawn, as above-noted, the virgin flow was thought to be about 1,000,000 acre-feet, and the latter was consequently the amount used in article III (b) as the additional quantity apportioned to the lower basin for use by Arizona.

As has been demonstrated, the framers of the compact, for the precise purpose of compensating Arizona for the inclusion of the waters of the Gila River within the Colorado River system, apportioned an extra million acre-feet per annum to the lower basin States, for use by Arizona.

I must move along, because of the limit of time which the committee has.

I want to say this, Mr. Chairman: I have tried in my statement here to give the summary of the evidence which has been submitted, which clearly demonstrates the correctness of Arizona's theory as to these two provisions.

I would like to close my statement with regard to those two provisions by pointing out again the testimony of the Honorable Clifford H. Stone on this subject, appearing on pages 519 to 521. I call special attention to that portion where it is pointed out that the framers of the compact intended depletion to be the measure of consumptive use.

I also call atention to the language of Judge Stone at the conclusion of his testimony, which language I shall now quote:

> Then, in conclusion, the Congress, we believe, will not approve an unconscionable position in interpreting the Colorado River compact for the purpose of proposed legislation. Nor would a court give approval to any interpretation of a solemn agreement among States which would be inequitable. It cannot be assumed that the compacting States intended to apportion water between the upper and lower basins of the Colorado River by terms and conditions the interpretation of which would limit one of the States to its existing uses of water when the compact was made, with a comparatively small opportunity for future development. We submit that the States did not do so.

Mr. POULSON. Mr. Chairman?

Mr. MURDOCK. Mr. Poulson.

Mr. POULSON. In quoting Judge Stone you are quoting him as an advocate of either one side or the other, but not as a judge sitting in a judicial capacity passing on the matter; is that right?

Senator McFARLAND. I am quoting the testimony that he gave before the committee. It is not as a judge; that is correct.

Mr. MURDOCK. We refer to him as "Judge" because he is an eminent water authority and is so recognized all through the West.

Senator McFARLAND. The other point which I made in my summary is that California would attempt to charge Arizona with all of the evaporation losses. In other words, "Give us everything, and we will give you nothing in return," as far as water is concerned.

California contributes nothing to the river, but she is profiting by this development of the river.

I will not take the time to go into my argument on that point.

I would like to state this to you in regard to these resolutions: The first time that those resolutions were ever heard of was on the last day of the hearings on S. 1175. You never heard of California wanting to litigate upon this subject until Arizona came in with a project; and then California filed resolutions for a suit in the Supreme Court for the express purpose of defeating the project.

Now, what does this mean? What does it mean if these resolutions are passed?

According to the testimony of Mr. Breitenstein and all the other basin States with the exception of California and Nevada, it would mean this: That there is not a justiciable issue at this time. It would mean that there would be a delay here of another year or two for the Supreme Court to determine what is involved. There is not a justiciable issue in these matters now before the Congress of the United States.

In the meantime, the people of Arizona would have to wait and again present this legislation to Congress, collect new data, new engineering data, which would mean another delay, upon which to ask for the authorization legislation.

By that time, of course, California would have completed all its appropriations and would come in before you then and oppose this legislation on another ground, as she has indicated she would do over in the Senate hearings.

What we ask you to do, gentlemen of the committee, is this: We ask you to do the same thing for the State of Arizona—a sovereign State, although not as powerful as our good neighbors from California—that has been done for California. We ask you to do the same justice for us that has been done for California in the past. Authorize these projects in order that when we have to go into court we can do so on an equal footing and with equal standing.

I do not have the time now to point out to you—because you are being called to the floor—the various legal arguments made in those hearings. I wish I did have time, because you will find, as pointed out by Mr. Breitenstein, that there was authorization for all these projects in the cases where there was held to be a justiciable issue before the Supreme Court, and where that court took jurisdiction.

Gentlemen of the committee, we must have this authorization, or there cannot be any lawsuit. California well knows that. As I said, she never introduced this resolution until we came in for our project, and her true purpose is to defeat or delay the authorization of our project.

Did you ever hear of California asking for litigation when she was coming before Congress and asking for money and authorization for

her projects, which we supported from Arizona and which you supported from your States? No.

For the first time we come before Congress with an authorization bill, when Arizona wants her just share of the Colorado River water.

Mr. MURDOCK. Senator, on Monday of this week I made an offhand extemporaneous statement before the Judiciary Subcommittee which is hearing these resolutions, and I said:

> In my judgment the passage of this resolution would mean interminable delay.

Does it strike you that way?

Senator MCFARLAND. It could only mean that, because at this time there is not a justiciable issue. To be sure, when the project is authorized, there may then be a justiciable issue; and California knows that.

This is the way, if any, to get the lawsuit—to pass this project for Arizona.

We have seen a lot of literature about this lately.

Mr. POULSON. At that point let me interrupt. I am not going to attempt to pronounce that word, but you claimed that there had been an opportunity for California to go in and take it to court. In other words, you are admitting there is a dispute and that it should be settled in the Supreme Court?

Senator MCFARLAND. No; I do not admit that, not for one moment.

I say that without authorizing a project there could never be any question about a justiciable issue. You could never present a claim of damages or an infringement of a right because there has not been a threat for us to take this water which we claim we are entitled to. There cannot be a justiciable issue until there is at least a threat.

We have tried to get in court. We have tried to get in on three occasions, and every single time California has blocked us. Every single time the court has said, in the cases where it was pertinent, that there was not a threat.

The only way there can be a threat is to pass this legislation authorizing a project, and then there will be a threat which the court will recognize, if they say that under all pertinent circumstances there is a justiciable issue.

Mr. POULSON. Very well. The Secretary has admitted in his report that there are two interpretations, and that there is a threat upon California's rights. You say that you would substantiate that threat by the authorization of this project. That in itself would certainly mean to me as a layman that there is a dispute which will eventually have to be settled in the Supreme Court.

Senator MCFARLAND. Let us just answer that——

Mr. ENGLE. Mr. Poulson, will you yield?

Mr. POULSON. Yes.

Mr. ENGLE. I want to add to that.

Mr. Oscar Chapman, in his statement to the Committee on the Judiciary of the House, said that there was a justiciable issue or controversy between the States. That is just one man's opinion.

Senator MCFARLAND. I know that you have had a quorum call. I just want to differ with that.

I just want to say this, if I may, in conclusion: The Secretary discourages the passage of this resolution until there can be known that a

justiciable issue exists. That means it could only be done after the project authorization is passed.

Now let me say this: I want the committee to hear the evidence in full. I hope that you do. I have not had the time to carefully outline all these matters. That will be done by other witnesses. I wish I had just a few more minutes, but let me say this to you:

This literature that is being spread by California here talks about the drying up of California. All California has to do to get all the water they need is to refrain from placing under irrigation the east and west mesas of the Imperial Valley. I am not contending that we should tell them where to get or to use their water, but the Department of the Interior has said that the area is nonirrigable.

I would like, Mr. Chairman, to place in the record the news release on that subject, from which it appears that the Secretary of the Interior has rejected the proposal to irrigate the east mesa.

(The document is as follows:)

DEPARTMENT OF THE INTERIOR

INFORMATION SERVICE

Bureau of Reclamation.
For immediate release March 28, 1949.

LETTER ON CALIFORNIA EAST MESA DISPATCHED

Secretary of the Interior J. A. Krug has dispatched a letter informing the Imperial Irrigation District, El Centro, Calif., that in view of land classification and repayment feasibility reports, irrigation development of public lands on the east mesa by either the Government or the district "would be inimical to the public interest." The east mesa area lies within the Imperial irrigation district served by the All-American Canal in southern California.

While the lands were originally withdrawn from public entry in the hope that they could be successfully developed, detailed investigations which have since been made, revealed them to be not practicable of irrigation and reclamation. The detailed land investigations were made by the Department of Agriculture, the University of California, and the Bureau of Reclamation.

The letter was addressed to Mr. Evan T. Hewes, president of the district's board of directors. The text follows:

Mr. EVAN T. HEWES,
President, Board of Directors, Imperial Irrigation District,
El Centro, Calif.

MY DEAR MR. HEWES: The Commissioner of Reclamation has brought to my attention the correspondence between your district and Regional Director Moritz, concerning assumption by the district of the care, operation, and maintenance, under the All-American Canal contract of December 1, 1932, of the common section of the Coachella Canal between engineer station 0 and approximately station 2603.

Particularly, your letter of December 6, 1948, suggests the necessity for clarification of the position of this Department with respect to the desire of your district to install turn-outs in the common section of the Coachella Canal at such locations, with such capacities, and at such time or times as the district may determine, following transfer of the canal to the district.

"The district's expressed desire for a free hand in constructing turn-outs in the common section of the Coachella Canal necessarily raises the question of whether the district may have the consent of the United States, express or implied, to construct turn-outs designed to serve public lands on East Mesa. In view of the conclusions reached in the land classification and development report of April 1947, and in the repayment feasibility report issued in March 1948, both of which you have received and which I have approved, it is evident to me that the irrigation development of public lands on East Mesa, either by the United States, or by Imperial Irrigation District, would be inimical to the

public interest, inasmuch as such lands are not "practicable of irrigation and reclamation." Accordingly, after full consideration, I am compelled to advise you I do not contemplate that any public lands on East Mesa will be opened to reclamation homestead entry and settlement, and, therefore, I could not approve the construction of canal turn-outs designed to serve these lands. In reaching this conclusion, I am not unmindful of the provisions of article 23 of the contract of December 1, 1932, insofar as they relate to East Mesa lands. I have been advised by the solicitor of this Department concerning the legal issues raised by this article. A copy of the solicitor's opinion is enclosed.

This decision has been made with reluctance insofar as it may disturb the existing contractual relationship with your district, but I am sure that my responsibility under the reclamation and public land laws permits me no choice in the premises. I assure you that I am prepared to consider a proposal from your district for a modification and equitable adjustment of the contracts of December 1, 1932, in order to bring the contract ino accord with the facts as we know them today, and to join with the district in submitting to the Congress appropriate recommendations to his end.

Sincerely yours,

J. A. KRUG,
Secretary of the Interior.

Senator MCFARLAND. California has never put more than 3,000,000 acre-feet to irrigation. She really has all the water she needs.

Arizona is in here fighting for her very existence. We are not trying to go out and say that Los Angeles is not going to be the biggest city in the world. It is all right for Los Angeles to be the biggest city in the world, as has been prophesied by some of the people here in Congress. That is okay.

All that we ask of the Congress is to give us the same opportunities that they have given California. Give us the same rights. Give us the same authorization legislation in order that we will stand on an equal footing. If the Supreme Court says there is a justiciable issue, we will fight it out; but give us an equal footing. Do not cut us off here. Do not deprive us of our rights just because we are a smaller State. Hear our testimony. When you do, I think that you will be convinced of the justice of this legislation and that it should be enacted.

Mr. ENGLE. One more question, Senator.

Senator MCFARLAND. Certainly.

Mr. ENGLE. I am going to request, if you can do so, that you come back tomorrow.

I would just like to throw out this thought: You say that there is a question about there being a justiciable issue, until this project is authorized. Would you have any objection to our writing into this bill, "in the event this project is authorized, there is a consent by Congress to take this matter to the Supreme Court?"

Would you object to writing in a consent by Congress to take this matter to the Supreme Court for a settlement of this question in the Supreme Court, as a condition precedent to any appropriation?

Senator MCFARLAND. Let me ask you this question, Congressman: Would you be willing to vote for authorization of this project with that provision in it?

Mr. ENGLE. I cannot answer that question. I do not know about the economic feasibility.

Senator MCFARLAND. If the Congressman will answer that question I will give serious consideration to the idea contained in his question. Otherwise it is a moot question.

Mr. ENGLE. We have to hear all the evidence on the economic and engineering feasibility. I think that raises some grave questions.

Assuming that the Senator is right, then I say this: Just assuming for the sake of argument that this committee should see fit to vote the bill out, would the Senator have any objection to such a provision?

Senator MCFARLAND. I will answer that question when the Congressman answers my question as to whether he is willing for the authorization to pass. I will give it serious consideration.

Mr. ENGLE. It might make a lot of difference.

Senator MCFARLAND. Maybe we could end this thing, if the Congressman will come in here with that definite proposal.

Mr. ENGLE. It might make a lot of difference as to whether I voted for the project or not.

Senator MCFARLAND. Maybe we can get together. If the Congressman is really sincere and will definitely come in here and state that California will support the project bill with that provision in it, I will give it consideration.

Mr. POULSON. In other words, Senator, so far your biggest argument to authorize this is not on the basis of its feasibility economically or engineeringly, but the fact that it will give you an advantage of going into the courts to be on an equal standing?

Senator MCFARLAND. Not an advantage, Congressman, mere equality of opportunity.

Mr. POULSON. For that reason you might be willing to do it?

Senator MCFARLAND. Not at all. I touched upon the feasibility of the project here, and I touched upon it lightly because of the lack of time. I could go into that. I dwelt briefly upon these other matters because they were the matters that were touched upon by Congressman Engle.

I say to you in all sincerity that we are not asking any advantage of you. Just put us on an equal footing and we will be satisfied.

Mr. POULSON. Then your answer is in opposition to the fact that this is a legal cause and should be settled as in a case dealing with problems entirely relating to judicial matters. In bringing this up in your argument against that you say, "We should pass this to bring the thing to a head eventually in the Supreme Court."

Senator MCFARLAND. Congressman, you misunderstood me. I say that we should pass the project because it means 150,000 people will otherwise have to leave the State of Arizona; also because it is good business for the Government of the United States to do it, and also because the project is a proper and feasible one.

I do say that if California is sincere in wanting to litigate, passage of a project authorization is the only possibility of establishing a threat of potential damage of a nature to get into court. I maintain that the issues have been settled. Even on California's theory of the case, it can very likely never get into court.

There will never be a justiciable issue until this problem is settled and this project is authorized. On Arizona's theory of the case, there is not a justiciable issue and there will not be.

On California's theory of the case, looking at it the way you construe it, there cannot be a justiciable issue until this project is authorized, because there is no threat to your rights at this time.

91190—49—ser. 11, pt. 1——5

Mr. ENGLE. Senator, we are going to have to go over to the floor, but I want to suggest that if it is possible for you to come back tomorrow morning we would like to discuss the matter a little further.

Senator MCFARLAND. If I cannot come back in the morning I will come back some other morning.

In the meantime, will the Congressman answer my question as to whether he would be willing to vote for this project with that provision in the bill?

Mr. ENGLE. I will answer that when you put it in.

Mr. POULSON. I will eliminate one of your arguments. I will say that you need the water and want to develop the area. I will qualify it by saying that we need it over in California. The question which arises is that there is not enough water for both of us.

Senator MCFARLAND. You can determine that under Congressman Engle's proposal.

Mr. MURDOCK. We thank you, Senator McFarland, for your helpful presentation.

The subcommittee will stand adjourned until 10 o'clock tomorrow morning.

(Thereupon, at 1:05 p. m., Wednesday, March 30, 1949, an adjournment was taken until 10 a. m., Thursday, March 31, 1949.)

THE CENTRAL ARIZONA PROJECT

THURSDAY, MARCH 31, 1949

HOUSE OF REPRESENTATIVES,
SUBCOMMITTEE ON IRRIGATION AND RECLAMATION
OF THE COMMITTEE ON PUBLIC LANDS,
Washington, D. C.

The subcommittee met, pursuant to adjournment, at 10:10 a. m., in the committee room of the House Committee on Public Lands, New House Office Building, Hon. John R. Murdock (chairman of the subcommittee), presiding.

Mr. MURDOCK. The committee will come to order. This is a continuation of our hearing on H. R. 934.

We plan this morning to give our time to lay witnesses. It was suggested that lay witnesses from Arizona who are appearing here on the measure be heard.

Our first hearing was given over pretty largely to attorneys. I think most of the men who will be called on today are not attorneys.

They are prominent businessmen and are here in the interests of their business, the most important fact of which is to get Arizona's needed water.

For that reason, we have changed the plan of hearing that we may hear them.

The first witness we will call this morning is Mr. Wayne M. Akin, chairman of the Arizona Interstate Stream Commission.

STATEMENT OF WAYNE M. AKIN, CHAIRMAN OF THE ARIZONA INTERSTATE STREAM COMMISSION

Mr. AKIN. My name is Wayne M. Akin. I am a resident of Phoenix, Ariz., and have been for some 14 years. I am here to testify on behalf of the Arizona Interstate Stream Commission.

Mr. MURDOCK. Mr. Akin, would you prefer to give a connected presentation without interruption and then hold yourself in readiness to answer questions?

Mr. AKIN. Yes, Mr. Chairman; that would be fine.

The commission was created by the Legislature of the State of Arizona for the purpose of formulating plans and the program for the practical and economic development, control, and use of the water of streams originating outside of the boundaries of the State and flowing into or upon the borders of the State.

The commission is made up of seven business and professional men drawn from all parts of the State and includes, ex officio, the State land and water commissioner and the chairman of the Arizona Power Authority.

This commission is vitally interested in H. R. 934, not only because of its economic importance to Arizona, but likewise because of its importance to the United States as a whole from an economic, social, and national defense standpoint.

As an official body, this commission is not interested in furthering the interests of any particular area or group of people. It is rather our purpose to maintain an objective viewpoint in the creation of a broad program calculated to develop the natural resources of the Southwest, integrating that development with the economy of Arizona as it fits into the entire economy of the United States.

It is important to emphasize the fact that the Colorado River constitutes one of the major, natural resources of our country. Its proper development is of vital importance, not only to the seven States through which it flows, but it is especially important in the over-all economy of the United States because of the fact that it provides one of the last great undeveloped frontiers which will provide room for expansion for the ever-increasing population of the United States.

The resources are not only agricultural, but provide an enormous power potential, the development of which will release large quantities of petroleum products by the substitution of hydroelectric power, which is not expendable, for oil-generated power which uses our declining oil reserves.

Furthermore, the development of the basin means the implementation of much-needed resources for national defense distributed over an area away from coastal or metropolitan areas and therefore strategically located for defense.

In order to understand the place of the State of Arizona in this over-all basin development program, it is essential that a clear understanding be had of the topography of the State and its relationship to the basin as a whole.

Of the seven basin States, Arizona, except for a very small portion of the extreme southeastern part of the State, lies wholly within the Colorado River Basin.

Roughly, two-thirds of the State is high, mountainous plateau, ranging from an elevation of around 4,000 feet to approximately 12,600 feet.

The Colorado River enters Arizona from Utah east of the center of the interstate boundary and for a distance of about 325 miles cuts the plateau with its tremendous canyon.

If you will look at this topographical map, perhaps as I talk you can get a rather clear idea of what we are talking about.

The Colorado River enters Arizona at this point [indicating], passes through the canyon and down between Nevada and Arizona, and provides the boundary between California and Arizona for the rest of the distance.

I will return to my text, if you are following it.

Thereafter it forms the boundary between Arizona and Nevada for roughly 150 miles and the California-Arizona boundary for another 240 miles so that for a total of some 700 miles the river flows in or along the boundary of Arizona. Roughly one-half of the State drains into the main stream of the Colorado River and the balance drains into the Gila River, flowing westerly across the south half of

the State and entering the main stream of the Colorado just north of the Mexican boundary.

You can follow this on the map. This area all drains into the main stream of the Colorado [indicating].

This area drains into the Gila with small areas here which drain south into Mexico.

Climatically the two-thirds of Arizona lying on the plateau as above described, is similar to other mountain States. However, the plateau ends in a series of precipitous cliffs and mountains and the remaining third of the State lies at a low elevation, running from about 100 feet up to approximately 2,500 feet.

Much of this area is desert and except for irrigation its economic value is limited to its mineral resources and the comparatively limited livestock grazing potential.

The river valleys provide some of the finest soil and the most productive climate to be found anywhere in the world. Within this area has developed the irrigated agriculture of Arizona with which we are immediately concerned.

As early as the fourth century A. D. irrigation was practiced on a significant scale by the Indians of this region. Portions of the canals built by these Indians can still be found.

On the Gila River, near the Casa Grande ruins which are preserved as a national monument, are found canals more than 40 miles in length with dimensions up to 20 and more feet wide on the bottom and 10 feet in depth.

Similar canals are found in the Salt River Valley in the vicinity of Phoenix. The engineering and development work done by these Indians is one of the marvels of bygone civilization when one considers that they were constructed and used by a people living in the Stone Age, without engineering or construction equipment other than stone or wooden hoes and baskets.

Four hundred years ago, when the Spaniards first came into this area, they found the remnants of this culture, but largely the civilization had disappeared because of the failure of their irrigation water. Archeologists tell us that as many as four civilizations have heretofore developed and have succumbed to periodic water failure.

The present problem of insufficient water is comparable to that which has gone before, with this notable exception: Engineering skill and mechanical development have now made it feasible to supplement the local water supply with that of the Colorado River.

H. R. 934 is designed to provide the supplemental water that will prevent a recurrence of disaster. At this point I want to emphasize the fact that it is not the purpose of this proposed project to provide water for the development of new lands. This water is to be used for the purpose of providing the essential supplementary supply for lands already under cultivation, the details of which I now desire to discuss.

During and immediately after the Civil War farming began to be carried forward on an important scale in the valleys of the Gila and Salt Rivers and by 1869 there was under cultivation by white men, with an established water right, 3,210 acres in the Salt River Valley and a somewhat smaller amount in the Gila Valley.

In addition to the lands of white farmers, Indians had under cultivation something in excess of 2,500 acres. During the 10-year period

following this, there was active expansion so that by 1880 something over 40,000 acres was under cultivation.

By 1900 this expansion had continued in the Salt River Valley to the point where approximately 150,000 acres was being farmed and the supply of water by direct diversion was subjected to disastrous, periodic droughts so that it was apparent that the storage of flood-waters was essential if the community was to survive.

In the year 1903 the United States Government, acting by the authority of Congress under what is known as the Reclamation Act, commenced the construction of the Roosevelt Dam upon the Salt River just below the confluence of Tonto Creek with the Salt River at a point some 75 miles east of the city of Phoenix. The original capacity of the reservoir was 1,300,000 acre-feet of water. This control of the river made possible the expansion of the irrigated area thereunder to approximately 240,000 acres.

At the time of this construction the use of the river for power was given only incidental consideration. However, the development of the use of electrical energy became early an important item and subsequently five additional dams were built on the Salt and Verde Rivers for further control of the storage of water and for the development of power.

In addition, a number of power plants were built on the canals. In 1928 a dam was completed on the Agua Fria River and at the same time the Coolidge Dam for the use of the middle Gila Valley was constructed. The water of this project, known as the San Carlos project, provided for 50,000 acres of the land of white farmers and 50,000 acres of Indian lands.

It was during this period that the influx of people into the Southwest was accelerated and the pressure for additional farm lands became great. As a result additional areas were brought under cultivation.

These bordered the older projects and extended on down the Gila River for a distance of 100 miles below Phoenix. Coincidentally the Yuma Valley at the mouth of the Gila River was developed with water from the Colorado River. This development paralleled that of the Imperial Valley in southern California.

The additional development was made possible by the peculiar conditions which existed on the rivers where, though dry above, waters rise in the channel of the river below, forming a new source of supply independent of that diverted above.

Water from this source was further supplemented by pumping and the area thus provided with water was expanded by over 200,000 acres.

However, the development of pumping for both drainage and supplemental irrigation water demonstrated the fact that the peculiar geology of the valleys of central Arizona is such that large bodies of underground water are available in underground gravel strata which make it practical to pump extensively for irrigation.

Furthermore, the development of more efficient pumps and the availability of power for their operation brought about an enormous stimulation of pump irrigation.

As a result during the last two decades, the cultivated area of central Arizona has been expanded to a total of approximately 700,000 acres.

This expansion was greatly accelerated by the demand for agricultural products to supply the war effort. The use of the underground

water has now progressed to a point where it is clearly apparent that the withdrawal exceeds the recharge and that only Arizona's share of the Colorado River can prevent the return to desert of at least 250,000 acres and the serious limitation of the use of the remainder of the irrigated lands.

By virtue of the compacts, laws, agreements and contracts as set forth in detail elsewhere in this hearing, the State of Arizona has a fundamental right to certain waters of the main stream of the Colorado River.

It is the purpose of H. R. 934 to provide the works necessary for the use of this water, and I would like to catalog the uses to which this water is to be put. In the interest of clarity I will discuss them simply by geographical location.

No. 1. Salt River project: While this project has excellent water rights, that under irrigation practice followed at the inception of the project would be considered adequate, it has now been found that by intensive tillage and the utilization of water sufficient for the full 365-day growing season, the productive capacity of the plant can be greatly increased.

Furthermore, it has been found that alkali accumulation on the lower areas of the project can be controlled only by the application of additional water sufficient to carry off the salt at the lower end.

Furthermore, the utilization of a supplementary supply of water for irrigation would make it possible to equalize the reservoir reserves, thereby firming up the hydroelectric power supply so essential for the continuation of irrigation pumping throughout central Arizona as well as providing the power for domestic and industrial use.

No. 2 Roosevelt water conservation district: This is an area which adjoins the Salt River project on the east. This district secured a right to certain water salvaged by lining the canals of the Salt River project and additional water from pumps.

The water strata from which this water is drawn are progressively being depleted so that pumping is now done at a depth in excess of 200 feet. It is essential to the economic stability of this area that supplemental water be supplied so that the underground supply can be protected.

No. 3. Roosevelt irrigation district: This area lies west of the Salt River project and the situation is essentially the same as above described, although part of the water for this project was obtained by salvaging drainage water from the Salt River project.

No. 4. Maricopa County municipal water conservation district: This district lies northwest of Phoenix and utilizes gravity flow from the Agua Fria River, stabilized by the Carl Pleasant Reservoir and supplemented by pumps. The gravity water has proven erratic and insufficient for this project and the underground reserves are demonstrably on the decline. Only by the addition of supplementary water can the retrenchment of this district be avoided.

No. 5. The Buckeye district, Arlington district, Gillespie project: I will discuss these together, as they are contiguous and their problem is identical.

These districts are irrigated by gravity water returning to the river below the Salt River project with the lower areas supplemented with pumps.

The problem of these districts is primarily salt control. Inasmuch as they secure their water by return to the river bed from irrigated areas above, the salt accumulation is intensified.

The water rights of these districts are among the oldest of the Southwest. The change in water quality has been beyond their control and as a result of the river water above them.

It is only by supplying these districts with additional fresh water from the Colorado River that declining usefulness and ultimate ruin can be avoided.

No. 6. Bordering upon the organized districts above mentioned are numerous small privately owned farms supplied entirely by pump water. These of necessity must be supplied with supplementary water for the reasons above discussed.

No. 7. San Carlos project: This is located on the Gila River and supplied with gravity water from the San Carlos Reservoir above the Coolidge Dam.

The development of this area by the Indian Service in cooperation with the white farmers was based upon a river flow history prior to its inception.

The flow records for that period indicated a much greater available supply than has been the case since the construction of the dam.

While those records indicated ample water for the developed area, the protracted drought since the construction of the dam has demonstrated that the water is insufficient.

In fact, the reservoir has never been filled since its completion. Supplemental water to firm up the required flow for both these Indian and white lands is one of the major objectives of the central Arizona project.

No. 8. The Santa Cruz River drains the border area of southern Arizona, extending its drainage area into Old Mexico.

This river is largely subterranean and flows from the south border into the Gila River at a point approximately southeast of Phoenix.

Approximately 200,000 acres of the finest agricultural land to be found anywhere has been developed by pumping from this subterranean basin.

The water supply for this area has proven to be definitely on the decline. Wells which 10 years ago were pumping at a depth of 80 to 90 feet are now pumping at a level of 200 feet or more.

It is apparent that the underground water supply is being exhausted. A large and important community which has grown up in and around this fertile valley is facing imminent return to the desert unless supplementary water can be provided.

No. 9. Some of the finest farm lands lie near Safford in the Gila River Valley near the eastern boundary of Arizona.

This land is irrigated by water directly diverted from the river. It has old water rights but by agreements at the time of the construction of Coolidge Dam, these rights were limited.

Because of the deficiency in the flow of the Gila River, as discussed heretofore, the water for this extremely productive area has been found to be short.

However, by using Colorado River water at a lower level, and the construction of an impounding works above this Safford Valley, an

exchange of water can be made which will firm up this irrigation supply.

In addition to the major areas above discussed, there are several smaller areas which I will not discuss in detail but which, by exchange of use and firming up of water requirements at lower elevations the economy of these smaller areas at higher elevations can be preserved.

Likewise, it is important to mention the essential nature of additional water supplies for rapidly growing population centers such as Tucson, Phoenix, and the intermediate towns.

The population of all of these towns has more than doubled in the past 10 years, and the influx of people continues unabated.

I have discussed at length the need for water and I am very conscious of that need as my business is farming. I am very conscious of the impending disaster, not only financial, but to social and human values which are painfully real to those of us who can see homes and whole towns facing desolation unless this problem is solved.

It is easy to visualize the impending disaster to farm homes and towns which are subject to flood, such as is the case in many portions of the Middle West and eastern portion of our country.

The disaster which faces our farms and homes is just as real and imminent although the causing factor is failure of water instead of excessive water. It is our conviction that these farms and home are entitled to the same consideration from the Congress of the United States as is that of the areas which are endangered by flood.

However, there is this important difference. Many of the flood-control projects are in the nature of things unable to carry the burden of construction costs and hence this burden must fall on the United States as a whole.

We, on the other hand, are asking not for a grant, but for the financing of a self-liquidating project. The economic feasibility of the project is a subject which will be discussed in detail elsewhere in these hearings.

I wish merely to point out that the farms and farmers of this area are willing and able to carry a just proportion of the cost of the project and the power developed by virtue of the project will provide the revenue necessary for completely paying it out.

Furthermore, the power requirements of the community which the project will serve are such that by the time the works can be built, this community will need the power developed at a price which will liquidate the cost of the project.

But this is not all. The Federal income, taxes generated within this social and economic structure by virtue of the continued prosperity which would ensue upon the construction of this project will, during the course of its life, repay the Treasury of the United States many times for the cost of the project.

The Congress should enact H. R. 934 because:

1. It will preserve nationally important existing agricultural values, both economic and social.

2. It will provide development of great national power resources, important not only to the peacetime economy, but of real urgency from a military standpoint as we face the new atomic age.

3. It will stabilize an already developed area which is capable of

sustaining a large population and which is geographically located for defense.

4. It is self-liquidating within the economic unit of the State of Arizona.

5. It will create a permanent national asset of tremendous proportions and provide the base for a perpetual large source of Federal taxes.

Thank you, Mr. Chairman.

Mr. MURDOCK. Thank you, Mr. Akin.

We would like to ask you a few questions. I think the committee will indulge me perhaps if I lead off, not with questions directly bearing on your statement but some others.

What is the Interstate Stream Commission of which you are chairman?

Mr. AKIN. The Interstate Stream Commission is an official body created by the Legislature of Arizona for the purpose of administering the interstate water problems of the State of Arizona.

Mr. MURDOCK. How old is the commission?

Mr. AKIN. It was created a year ago, in January.

Mr. MURDOCK. Are there other members of the commission present this morning?

Mr. AKIN. Yes.

Mr. MURDOCK. Would you mind introducing them?

Mr. AKIN. Dr. Alfred Atkinson, of Tucson; Mr. Jesse A. Udall, of Safford; Mr. R. H. McElhaney, of Yuma; and Mr. Jay Gates, of Kingman.

Mr. MURDOCK. Thank you. And there are many questions which come to my mind, but I think I should await the pleasure of the committee.

Mr. Engle, have you questions?

Mr. ENGLE. I will defer for the time being, Mr. Chairman.

Mr. MURDOCK. Mr. Welch, have you any questions?

Mr. WELCH. Mr. Chairman, has it been stated for the record the number of acre-feet of water taken from the Gila River from its source, to a point where it intersects the Colorado River near Yuma?

Mr. MURDOCK. Mr. Welch, I should have said before opening the matter to questioning that many of these witnesses we are to have will have anticipated a good many of these questions so, of course, they will be answered by witnesses but we also have the engineering experts who have all these facts tabulated.

However, it is a good question, if Mr. Akin will answer it.

Mr. AKIN. As the chairman and the committee know, no doubt, the matter of supply and use of water is complicated. We will develop it in the course of our testimony at great length and I believe as a layman it would be better if I did not undertake the answer at this time, if the committee would bear with us.

Mr. WELCH. The answer of course would apply to the average annual figure. We will develop that thoroughly before we finish our testimony.

Mr. MURDOCK. That is right. All these streams are quite variable. As a matter of fact the Gila River is now dry as a bone, is it not?

Mr. AKIN. For most of its length, yes.

Mr. MURDOCK. Mr. Morris.

Mr. MORRIS. I believe I have no questions at this time.

Mr. MURDOCK. Mr. Lemke.

Mr. LEMKE. I have several questions.

In the first place, I wish to state that my sympathies are always with the underdog, as compared with the glamorous sister protected with fruit and gold.

Mr. ENGLE. Do not leave Nevada out of this. Senator McCarran made a very persuasive statement the other day over on the other side.

When you speak of this being a matter between poor Arizona and rich California, it is a matter between poor Arizona and poor Nevada also.

Mr. LEMKE. Also my sympathies are with Nevada too.

The underdog needs defense and protection. However, there is this question in my mind concerning the necessity of this. You are asking us to build a big dam at considerable expense. Do you have water enough that legally belongs to you to fill it? What is your answer to that?

Mr. AKIN. Do you want my opinion?

Mr. LEMKE. Not your opinion; I would like to have facts.

Mr. AKIN. Again you have raised a question that is both a legal and an engineering question and should, I am sure you will agree, be answered by experts.

I feel confident that by the time we have completed this testimony we will have presented the facts that will convince you that the water is physically available and that we have a legal right to its use.

Mr. LEMKE. Let me ask you this: Do you have enough water, leaving out of the consideration the controversy between California, and Arizona, have you enough water, assuming that the decisions will be made in favor of California, have you enough water to fill the dam?

I know of the necessity; I am with you 1,000 percent that you need it and should have it if you can get it, within the compact you have agreed to.

I think you made a mistake when you agreed to the compact. I note California took all but 3,100,000.

Mr. AKIN. You must recognize this: We were coerced into accepting that water division. We did not accept it voluntarily. We spent 25 years trying to prevent a thing which we thought was unjust.

We had no choice in the matter. We were coerced into accepting it. However, at the same time California, in order to get what they were after, the Hoover Dam and works appurtenant thereto, limited themselves. We accepted that limitation and the protection provided thereby. What we are asking California to do is live up to that limitation.

If they do, we will have plenty of water.

Mr. LEMKE. As I say, my sympathies are with Arizona but suppose the Supreme Court holds to the contrary and we have a big dam there and no water? I think the Supreme Court is the only tribunal that can finally settle this question unless you folks can get together and make some agreement between yourselves personally.

Mr. AKIN. I think Senator McFarland yesterday brought that out quite well.

Mr. LEMKE. I was unable to hear that discussion yesterday because I was busy on the floor. The position of Arizona is that until this bill

is authorized there is not a judicial controversy. If after the authorization, a judicial controversy is created, then the United States Supreme Court can rightly make the decision.

I shall read Senator McFarland's opinion because I have a great deal of respect for his ability. As I stated, I think your big job here is to convince the committee that you will be able to fill that dam and have water enough to do what you want to.

Mr. AKIN. I feel confident we will convince the committee.

Mr. LEMKE. We do not want to be up against the position of having a dam with no water. The dam would do no good without water would it?

Mr. AKIN. Arizona is no more interested in producing a monument to mistaken engineering than is any other part of the United States. After all, we pay for our share of the mistakes as well as the proper development program.

Mr. LEMKE. We all make mistakes.

Mr. ENGLE. You would not want to build a monument, either, to a mistaken concept of the law, would you?

Mr. LEMKE. No.

Mr. ENGLE. In other words, the engineering features of this project and its financial feasibility are wholly separate and distinct questions from that of the legal availability of the water. It is true that Senator McFarland talked about a justiciable issue, cause of action or controversy. In my opinion the Supreme Court will decide that. We will not be able to decide it. The Supreme Court will decide whether there is a cause of action.

Mr. LEMKE. We have had this since 1935, and it seems that there could be some way to get it to the Court. Yet, I see, the Supreme Court did not take jurisdiction.

Mr. ENGLE. The Federal Government was not a party to the suit. We are trying to get the Federal Government made a party to the suit.

Mr. MURDOCK. Have you further questions, Mr. Lemke?

Mr. LEMKE. That is all.

Mr. MURDOCK. Mr. D'Ewart?

Mr. D'EWART. I have a number of questions with regard to the points Mr. Engle raised yesterday as to the limitation of this committee in authorizing the project.

If his thesis prevails, that he presented to the committee yesterday, that we have no right to authorize any project wherein there is a question as to the availability of supply of water, I believe the committee will have to reappraise all of its authorizations heretofore made and certainly we should reappraise what we did in the case of H. R. 1770.

I think we raised a very, very interesting legal question on that. I would like to see it discussed before this committee.

Mr. AKIN. If the committee will bear with us, I am sure we will have that thoroughly presented.

Mr. MURDOCK. Mr. Marshall——

Mr. MARSHALL. I have just a few questions for my own information.

How far is it feasible to pump water for an irrigation project, usually?

Mr. AKIN. Usually? Well, that is a difficult question to answer be-

cause a lot depends on the type of crops. For very high priced crops you can pump water from great depths. It also depends on the cost of power.

Of course, the efficiency in pumps, which has vastly improved in the last few years, is a great factor. We can pull water now from greater depths at a smaller cost than we could 15 years ago.

The practical water lift would have to be tied into the price of crops also. In other words, you can pump water at a cost that is in proportion to the value of the crop you are selling.

Mr. MARSHALL. About how many irrigators are involved in the three projects of Buckeye, Arlington, and Gillespie?

Mr. AKIN. I do not have those figures on the tip of my tongue. Very roughly it would be something above 30,000 acres.

Mr. MARSHALL. As I understand your statement, you do not contemplate opening up any new land; it is to take care of the land presently being farmed?

Mr. AKIN. That is right.

Mr. MARSHALL. Do you have a zoning ordinance or something like that?

Mr. AKIN. Yes; we have a law enabling the State Water Commissioner to prevent new pumps going into any critical area. It is intended to prevent further expansion in critical areas.

Mr. ENGLE. Mr. Chairman, may I ask Mr. Akin to point out on the map, if he will, where the diversion will take place from the Colorado River to supply the water?

Mr. AKIN. Just above Parker Dam [indicating].

Mr. ENGLE. You have a pumping lift there of close to 1,000 feet, have you not?

Mr. AKIN. Yes.

Mr. ENGLE. Where does the power unit come from to do that?

Mr. AKIN. Bridge Canyon.

Mr. ENGLE. Where is Bridge Canyon on the map?

Mr. AKIN. Right here [indicating].

Mr. ENGLE. It is just below the Grand Canyon?

Mr. AKIN. It is right in the Grand Canyon.

Mr. ENGLE. How far is it from where you made your diversion to the place where the power plant is located, in river miles?

Mr. AKIN. In river miles or power-line miles?

Mr. ENGLE. Well, both, if you know.

Mr. AKIN. I would have to determine that.

Mr. ENGLE. Could you give it to us roughly?

Mr. AKIN. It would be somewhere around 250 river miles, and 100 or a little more air-line miles.

Mr. ENGLE. There is no physical connection, then, between the power dam to create the power and the diversion for irrigation?

Mr. AKIN. I do not know what you mean by the physical connection.

Mr. ENGLE. What I mean is this, that in the average instance they build a dam for irrigation from which there is incidental power, such as we have at Shasta, for instance.

In this case, the power program is set up for the specific purpose of financing the water division several miles below; is that right?

Mr. AKIN. I did not understand your question.

Mr. ENGLE. A little over 100 miles below; is that not right?

Mr. AKIN. Will you state your question again? I am sorry, I did not get it.

Mr. ENGLE. I say, in this instance the power project is set up some 100 miles away for the sole purpose of financing the pumping lift and the cost of the diversion; is that right?

Mr. AKIN. Yes, and no. Of course, as originally planned the water was to be diverted by gravity from Bridge Canyon and that is a part of the ultimate plan.

If in the future at some time it is decided that it is desirable to do that, it is perfectly physically possible to do it.

Mr. ENGLE. You have to dig a tunnel, do you not?

Mr. AKIN. Yes.

Mr. ENGLE. It is an 80-mile tunnel?

Mr. AKIN. No, it is about 78 miles.

Mr. ENGLE. How much does that cost?

Mr. AKIN. You will have to ask the engineers. That has never been accurately figured out. It is too much to be done under present cost conditions.

Mr. ENGLE. Does this bill authorize the construction of that tunnel?

Mr. AKIN. It does not.

Mr. BENTSEN. Do you have a ratio of cost on your project?

Mr. AKIN. The engineers have it.

Mr. BENTSEN. How much will your project cost?

Mr. AKIN. The figure based, I believe on 1948 values and costs, is $738,000,000.

Mr. BENTSEN. That is not just for 30,000 acres?

Mr. AKIN. No.

Mr. BENTSEN. How many acres are you going to irrigate?

Mr. AKIN. The project will supply supplementary water for approximately 650,000 acres.

By exchange it will be for considerably more than that. Of course, also you must remember that the project we are talking about also provides silt control, which is essential for the use of Bridge Canyon Reservoir and for the protection of Lake Mead and the Boulder investment, which is of vast importance.

Mr. ENGLE. How many acres will not have water if this project is not built?

Mr. AKIN. Variously estimated, and of course, in the nature of things, something over a quarter of a million acres will have to return to desert.

Mr. ENGLE. It is something around 225,000 acres, and this project costs $738,000,000. Is that right?

Mr. AKIN. Yes.

Mr. POULSON. You will remember yesterday the Senator said it would be $738,000,000, omitting that pipe line which they are putting off for the time being because of the prohibitive cost, so it will cost more than that.

Mr. ENGLE. That is correct, is it not; the $738,000,000 does not include the tunnel?

Mr. AKIN. It does not include the Bridge Canyon tunnel.

Mr. MURDOCK. Mr. Poulson.

Mr. POULSON. I was very much interested in the question brought

up by my distinguished colleague, Mr. Lemke, who is well known in his fight for what he considers justice to those who he thinks do not have the proper support but at the same time he always adheres to what are actual facts and the law and he brought up a question on that same basis which I think hits at the kernel of the whole thing.

He said, if Arizona is right, they will have enough water. If California is right, he asked you if you would have enough water for the project, and I believe you referred to later witnesses. Did not the Secretary of the Interior in his report state that if Arizona is right, you have enough water; if California is right, there is not enough water?

Now, when we start to spend $738,000,000 plus the unknown quantity that would be required to be spent in the event that we build the tunnel afterward, in a project which costs as much as TVA, and as much as the St. Lawrence seaway and five times as much as Boulder Canyon, with the possibilities of having a dry reservoir, because in your statement on page 9 you are speaking of the San Carlos project or the Coolidge Reservoir and you say, "In fact, the reservoir has never been filled since its completion."

So with all of these question marks before us, do you think it sound business for Congress to appropriate that amount of money which means that other projects will have to stand by until its completion, in the face of the fact that there is a possibility—we will say it even that way, I will not say that it will be—that there is a very strong possibility that you will not have enough water.

Mr. AKIN. We do not ask for the appropriation of any money. There are many questions that must be settled that cannot properly be settled until authorization has been had. We are asking for authorization. Before this money is spent, these problems will be resolved.

Mr. POULSON. Do you think Congress should go ahead and make authorizations when they know that there is a strong possibility that it cannot be carried out? Do you think that is good judgment on the part of Congress in doing that?

Mr. AKIN. I think it is excellent judgment to bring this thing to a focus. It will be brought to a focus by the authorization.

Mr. POULSON. I am very sympathetic also to social and human values that you mention in your statements and I realize that there will be a great many who would suffer, but that is on both sides, as well as in the Nevada and California side, as well as the Arizona side?

Mr. AKIN. If the Congressman will excuse me, we take issue with that. There will be no suffering in Nevada or California as a result of this.

Mr. POULSON. Did you know that right at this moment, for instance in the event the water is going to be used, that San Diego is depending entirely upon the water from the Colorado River, and speaking of defense, San Diego is probably one of the most strategic spots in the entire West?

Mr. AKIN. More power to San Diego. They have their aqueduct built at the expense of the United States Government and they are getting the water.

Mr. POULSON. California paid for its own aqueduct.

I am glad you brought that up.

Mr. AKIN. I will ask the Congressman to bear with me. We will

bring that out further and I am not qualified to be discussing it with you, sir.

Mr. POULSON. You say on page 11:

> We, on the other hand, are asking not for a grant but for the financing of self-liquidating projects.

You say the interest money is to be used in paying for the aqueduct.

In other words, it is not to be paid into the Federal Treasury but that money which is figured in interest in setting up the price of power, that interest is being used to subsidize the aqueduct and the interest alone for 80 years at 2 percent, which it is costing the Government to put that up, will equal approximately $1,000,000,000, so do you think your statement is true when you say it is self-liquidating?

Mr. AKIN. I would like to ask the Congressman if he has figured the income taxes which the Federal Government will receive in lieu of that interest used for assisting the agricultural end of the thing?

Mr. POULSON. Does not the Federal Government collect income taxes in California or Nevada just as they do in Arizona?

Mr. AKIN. Certainly.

Mr. POULSON. So that is eliminated as far as that is concerned.

Mr. AKIN. I do not think it is eliminated at all.

Mr. POULSON. But they are putting up $1,000,000,000 in the form of interest which they are putting out in financing and not getting the interest back.

Mr. AKIN. I do not agree there is a parallel there at all.

Mr. POULSON. That is in the bill.

Mr. AKIN. California will not provide those taxes that will go out when that community returns to the desert.

Mr. POULSON. If the water is used anywhere it is all going to be used and is going to make income regardless where it is going to be used.

That is a sympathetic and emotional appeal. We are confining ourselves to the actual facts.

Is that not the basis upon which we should proceed?

Mr. AKIN. I hope that California will confine themselves to the facts.

Mr. POULSON. That is what we want. That is why we wanted to have it taken into the Supreme Court.

Mr. AKIN. And we will likewise do the same thing.

Mr. POULSON. We come to the Bridge Canyon Dam now. Is it not true that when you use that Bridge Canyon, that that Bridge Canyon Dam which will supply the power which I personally, and I am sure California would do likewise, are for the building of all these power projects, we need them along the river.

However, the water is what we are objecting to, that you are taking out of the river which we claim is not your water.

But in using that to finance or to subsidize your irrigation, your aqueduct across there, you are using the proceeds from that power dam on Bridge Canyon to finance things in Arizona.

Has not the upper basin just as much right to use the power revenue and the interest on that in the Bridge Canyon as you in Arizona? In other words, they could have a project up in the upper basin and tie in the Bridge Canyon Dam on it just the same and use the power rev-

enue to help finance the upper-basin project just as well as you are there?

So are you not in reality getting the jump on the upper-basin boys by coming in with this project, using up the revenue off that to finance yours, while the upper-basin boys are sitting by and allowing you to do that?

Also, there is the fact that while we are appropriating that $1,000,000,000, the upper basin will have to stand by and wait until that is paid off before they will have a chance to come in and ask for any appropriations to get money for their projects over which there is no water dispute?

Mr. AKIN. You have asked an extremely complicated and far-reaching question that I would not attempt to answer at this time except to say this: The basin States have discussed that matter at great length and are in agreement. We are not in any way impairing the rights or opportunities of the upper-basin States and they thoroughly agree.

Mr. MURDOCK. There is one simple phase of the complicated question, however, which I believe you could answer, Mr. Akin:

Could you tell us "who got the jump on whom" in this development?

Mr. AKIN. I think that is perfectly obvious.

Mr. ENGLE. Mr. Chairman, I have two very brief questions.

Mr. Akin, on page 11 of your statement you say:

> I wish merely to point out that the farms and farmers of this area are willing and able to carry a just proportion of the cost of the project.

Now, Senator McCarran, of Nevada, in making a statement in opposition to this project before the Senate committee, said:

> The central Arizona project is the first project presented to Congress on which the irrigators are unable to repay any part of the investment and are unable to pay even the operating cost and the cost of the power for pumping.

Now, those statements—yours and Senator McCarran's—are diametrically opposed. Would you like to comment on that?

Mr. AKIN. If the Congressman will bear with me, I would prefer not to enter into that discussion, although I think it is a perfectly pertinent question which I think we will answer as we go along.

I think it is something so technical that we should have the Bureau with their figures and our engineers and economists with their figures, to present the thing adequately to the committee, and I think that any answer I would make would be simply superficial.

Mr. ENGLE. You admit that the statements are in conflict, that you cannot reconcile the two statements. You say you people are able to pay and willing to pay and Senator McCarran says that the irrigators cannot pay.

I think, Mr. Chairman, that is something that should be resolved.

There is one further question:

I have before me a copy of the letter sent by the director of the Bureau of the Budget under date of February 4, 1949, in which he said that the authorization of this project is not in accordance with the President's program at the present time, but he made this significant statement in connection with the project.

91190—49—ser. 11, pt. 1——6

He says:

Even so, the life of certain major parts of the project is appreciably less than the recommended 78-year pay-out period.

Did he have reference to certain portions of this project wearing out? That is, the life of certain elements of this project not being equal to the length of the pay-out period?

Mr. AKIN. I have no means of knowing to what he referred because he did not elaborate on it.

Mr. ENGLE. You are familiar with the statement, are you not?

Mr. AKIN. I am.

Mr. ENGLE. Was he referring to the silting-up of some of these dams?

Mr. AKIN. I have no means of knowing to what he referred. I think that is a question that can be resolved by the Bureau of Reclamation engineers and the other private engineers who have studied these things.

Mr. ENGLE. If it is true that we have a 78-year pay-out period on this project and certain elements of the project have a life appreciably less than the recommended 78-year pay-out period, that would affect the financial feasibility, would it not?

Mr. AKIN. Certainly.

Mr. ENGLE. You would have to rebuild those parts or clear them out, if it was silt?

Mr. AKIN. I hesitate to get into that thing. It will be developed. I assume what we are talking about is the reservoir above Bridge Canyon Dam which is a very narrow canyon with a limited storage capacity and hence the danger of quick silting.

The Coconino Dam and the Bluff Dam are part of a program to check that immediately.

The ultimate development of the river above the dam is essential. However, that is not a pertinent question here because whether this job is done for the Central Arizona project or not, it will be done for power.

California is in a somewhat difficult position in that thing because they want that dam built for power. And so do we. The dam will be built for power because there is a natural resource that the economy of the United States demands.

Mr. ENGLE. I will say this, Mr. Akin, we are in agreement that it is proper to build a power project here but we do have great doubts as to whether it is proper to build a project to finance the diversion of water which you claim.

Mr. AKIN. That is a different question.

Mr. ENGLE. It is. Thank you very much.

Mr. MURDOCK. Governor Miles, have you any questions?

Mr. MILES. I believe not at this time.

At the conclusion of the balance of the testimony I may have some questions.

I would like to know if Congressman Poulson is satisfied with Commissioner Akin's answer to your question as to "who got the jump on whom."

Mr. POULSON. I think by coming in at the last, about a year ago, you figured you were getting the jump on everyone.

Mr. MILES. No further questions.

Mr. MURDOCK. Mr. Barrett.

Mr. BARRETT. No questions.

Mr. MURDOCK. Mr. Aspinall.

Mr. ASPINALL. If this committee is going to enter into any judicial question whatsoever in the interpretation of this matter before us, it might be well to bring former President Hoover and Mr. Bannister and others before this committee, who can speak personally on what took place in the ratification of the first compact that is involved here. This seems to be the whole question as far as the judicial part is concerned. The matter being presented now rests on a question of fact.

Mr. MURDOCK. The Chair has been pleased to note that we have had other Congressmen drop in this morning for a short time. Some have gone because they had other business.

My colleague from Arizona is present again this morning. Have you any questions, Congressman Patten?

Mr. PATTEN. No, thank you. I think the situation has been well handled. I appreciate particularly the question of the chairman about "who got the jump on whom."

Mr. MURDOCK. Thank you, Mr. Akin, for your presentation.

When I went to Arizona in 1914 I found there a pioneer family, having long ago taken root in the Valley of the Sun, and had become one of the leading families in the State. That was the O. S. Stapley family.

I would like to call as our next witness, Mr. D. L. Stapley, who is the vice president and general manager of the O. S. Stapley Co., and one of the most prominent businessmen in central Arizona.

Mr. Stapley.

STATEMENT OF D. L. STAPLEY, VICE PRESIDENT AND GENERAL MANAGER OF THE O. S. STAPLEY CO.

Mr. STAPLEY. Mr. Chairman and members of the committee, my name is D. L. Stapley. I am vice president and general manager of the O. S. Stapley Co., Phoenix, Ariz., dealers in hardware, steel products, International Harvester Co. farm implements, tractors and motortrucks; industrial equipment and supplies.

Our company operates a wholesale hardware subsidiary, the Arizona Hardware Co., both institutions serving the entire State of Arizona.

I am also an executive committee member of the Central Arizona Project Association and a citrus grower.

Because of the acute water shortage in our State, I am deeply concerned about its future unless supplemental waters from the Colorado River can be secured for our cultivated farm lands.

In the beginning, may I inform you that I am a native Arizonian and I have observed, from almost its earliest stages, the development of our agricultural economy to what it is today. My father and mother, as children, settled with their parents in the Salt River Valley at Mesa, Ariz., in the years 1882 and 1884, respectively.

Frontier life with these early pioneers was one of disappointments, hardships, and privations.

Their discouragements only served to make them work harder to make a living and to establish homes while developing the soil and

finding markets for such farm products as they were able to raise.

My father, O. S. Stapley, on reaching maturity, was an untiring worker and leader in all worth-while activities and developments of our valley and State. As a very young man he established a hardware business at Mesa, Ariz. It was a small beginning with only $800 stock investment, but through his industry and foresight, the business has grown to a sizable institution today.

Each of these early years brought additional desert waste lands under irrigation and the rich soil grew abundant crops. My father not only witnessed this development, but was a part of it. He worked and counseled with the farmers, knew and called them by their first names, and, as his business grew, he extended them credit to get started and carried them through hard and difficult times.

He, with others of the early leaders, caught the vision of what could be a vast and productive commonwealth and when water storage dams were contemplated and built, and roads had to be constructed and canals extended, he was in the foremost ranks to accomplish the goals set.

He, with all other early settlers, gave unselfishly of time and money to develop the vast resources about them. His business grew with the community and eventually the original store developed into a State-wide business and is supervised today by his family, a family of five sons and three daughters.

While recognizing the State's many advantages, we also know that the future of our homes and valleys is the future of farms, and the future of farms is an adequate water supply.

The life work of our parents and other pioneer settlers and the work and livelihood of future and present generations of these pioneer families depend upon a stable irrigation water supply.

A great and progressive commonwealth has been built upon the vision and hard work of these early pioneers.

Their record is one of far-sighted planning and outstanding development. The State's growth is primarily due to agriculture, the result of their labors and a basic requirement for a successful economy.

Arizona has a great future, providing ample water can be assured. However, sufficient water for irrigation purposes is not now available and unless immediate action is taken, in face of our sustained drought conditions, to secure use of additional waters from the Colorado River our picture now, and for the future, is dark indeed. Central Arizona has harnessed every available internal water source.

Therefore, stabilizing our State's economy and utilizing the fullest production of our vast cultivated acreage requires firming up present water supplies with supplemental waters from the Colorado River.

Unless these supplemental waters are obtained, Government moneys now invested in Arizona, particularly in certain irrigation projects, will be undermined.

This also applies to other Federal loaning and insuring agencies, as all loans are made secure through the constant irrigation of lands and consequent growing of crops.

Government moneys have helped build our State's economy and these investments in turn have produced millions in Government revenues.

Unless these Government investments and sources of revenue are protected by making available supplemental waters from the Colo-

rado River, not only the Government stands to lose heavily, but also the people of our State will suffer losses in income and value of property holdings.

Our own business, founded in 1895, which now consists of seven retail hardware and farm implement stores, one retail motortruck and service-shop operation, and a wholesale hardware division located in the heart of central Arizona's agricultural lands, has paralleled the development of reclamation and irrigation projects.

The number of our stores have increased as additional waters were made available by man-made reservoirs and economical use of underground water by pumping.

The present serious water shortage is of great concern to both farmers and businessmen alike and all planned moves are predicated upon an insecure feeling.

Water reserves, both surface and underground, are being depleted. Our farmers last year took a 50-percent reduction of normal irrigation water requirements and again this year, are only assured 2 acre-feet per acre, 50 percent of need.

This, of course, presents two alternatives—either 50 percent of our farm land must lay idle, or if an attempt is made to cultivate 100 percent of the land on 50 percent of normal irrigation water requirements, harvests will be greatly reduced. Four acre-feet of water for each acre of growing crops is the annual minimum irrigation safety factor.

The past 2 years Coolidge Dam, located on the Gila River, with 100,000 acres in the San Carlos irrigation project depending upon it for irrigation water, went below the point of use the latter part of May and for the balance of the year contributed nothing in the way of irrigation waters, and again this year, the present supply is not sufficient. Therefore the only available water for this vast acreage is water from an already reduced underground supply.

When it was apparent last year Coolidge Dam reservoirs were going dry, the San Carlos irrigation project secured a rush Federal loan to sink wells and install pumps to take up some of the slack.

This, however, provided only a portion of irrigation water requirements and gave but temporary relief and the added load on the underground water supply was merely one of reserve depletion.

There are approximately 150,000 additional cultivated acres in the Coolidge, Eloy, and Casa Grande districts irrigated by pumping only.

The water level in these wells has been steadily lowered year after year as the underground supply has had to carry the full load of this entire cultivated acreage and without rains to restore underground reservoirs results in further depletion, increasing the critical water condition for the farmers of this area.

The sustained seriousness of this water shortage continues to hold up a planned building program of my company to improve service to farmers in both Casa Grande and Coolidge districts.

Declining farm prices and a serious water shortage does not justify further investments until supplemental waters are made available to these lands.

The land of this valley is rich and productive with water, but without water it is valueless and can only return to the desert.

Back of our reservoir dams are hydroelectric plants, but as these surface waters are depleted, generated hydroelectric power also de-

creases, and even now there are designated days when power cannot be used for pumping purposes.

Therefore, where formerly electricity was used, gasoline, gas, and Diesel-powered engines have or must yet be acquired at considerable extra cost to the farmers to supply needed underground waters to grow crops.

This has and will work an extreme hardship upon our farmers, and unless the price of crops are extremely profitable these farmers will either lose considerable money or will have to close down farm operations altogether.

Pumped irrigation water costs at present are high, already reaching a cost of $39 per acre, and with the constant lowering of wells will necessarily be higher.

These factors, along with declining farm prices, will soon place farmers in an unprofitable position, and producing agricultural lands, unless supplemental waters at reasonable prices can be obtained, will revert to a desert status.

Agriculture in central Arizona has been developed on a broad and diversified scale, and if deprived of an adequate water supply will seriously affect the economy the State in that the agricultural districts will be unable to bear their proportionate share of the taxes necessary for the State's operating expenses, and will thus throw upon other industries such a heavy burden of taxation that they will be handicapped in meeting competition in the production and sale of their products. The scope is broader than just our own State.

The economy of all sections of the United States with whom our farmers, cattlemen, and business concerns trade are also affected. It further lessens Government tax revenues, not only from Arizona citizens but also from those who buy and sell our produce and products.

Similarly, it affects the profits and taxes of the many manufacturers and producers who now ship large quantities of machinery, equipment, farm implements, supplies, foodstuffs and the thousand and one miscellaneous items necessary to sustain the commonwealth of our State.

These companies are located in the East, the South, the Midwest, and Pacific coast area. Our problem is the Nation's problem because our economy is wrapped up with the entire economy of the country, and if anything happens to it, the country at large suffers.

Our company perhaps is a fair example of how extensively Arizona business concerns must look to manufacturers outside our State for merchandise, materials, and supplies.

The combined operations of both our companies, beginning with our fiscal year October 1, 1945, through March 31, 1948, disclose purchases in round figures of $1,445,000 from the Eastern States.

The industries in Connecticut contributing $551,000; New York State, $455,000; Pennsylvania, $105,000; Massachusetts, $95,000.

The Midwestern States supplied us with $5,530,000 in merchandise. Industries in Illinois, except the International Harvester Co. as noted below, furnished in round figures, $941,000; Wisconsin, $558,000; Ohio, $381,000; Indiana, less International Harvester Co. purchases, $273,000; Missouri, $267,000; Michigan, $130,000; and Minnesota, $54,000.

The Western States supplied us with $4,873,000 in merchandise, California furnishing $2,964,000—I want the Congressman from Cali-

fornia to please note that—Arizona, $1,025,000; Colorado, $104,000; and Washington, $22,000.

The difference between amounts furnished above for given grouping of States and the total amounts of the States listed are represented in purchases from other States than those named.

A few of the nationally known companies from whom we buy, and the approximate value from each during this period are:

International Harvester Co (Approximately $930,000 of this supplied from Pacific coast operations or branch houses and the balance from the Midwest and Eastern States.)	$3,507,000
Columbia Steel Co. and subsidiaries (subsidiary of United States Steel Corp.)	625,000
Sherwin-Williams Co., Cleveland, Ohio	120,000
Glidden Paint Co	138,000
Remington Arms Co. and Peters Cartridge Co. (division of du Pont Co., Bridgeport, Conn.)	196,000
Williams Radiator Co., Los Angeles, Calif	270,000
Imperial Brass Manufacturing Co., Chicago, Ill	172,000
Bucyrus-Erie Co., Milwaukee, Wis	191,000
Corning Glass Works, Corning, N. Y	85,000
J. D. Adams Co., Indianapolis, Ind	137,000
American Fork & Hoe Co., Cleveland, Ohio	99,000
The Stanley Works, New Britain, Conn	112,000
Reynolds Metal Co., Richmond, Va	103,000
Wilson Sporting Goods Co., Chicago, Ill., and Los Angeles, Calif	97,000
Total	5,852,000

During the past 6 years we have paid in excess of one and two-thirds million dollars in taxes, both to State and Federal agencies. Our company's major volume of business direct and indirect is with farmers.

We also sell extensively to cattle ranchers, contractors, industrial organizations, transportation concerns, some departments of Government and also dealers in hardware and related items.

It may be argued we have presented the best period of our operations. However, the tremendous population growth in the last 7 years cannot be overlooked, and it also must be remember we have been subject to restrictions in many categories, either by directives or allocations or inability to furnish merchandise that has greatly limited available potential sales.

Even at present, sales are still restricted in many lines; some of which are volume items.

We employ approximately 350 people, and most of these employees' total savings are invested in homes and small acreages, and depressed conditions brought about by any water shortage will seriously affect not only their investments but living standards.

There have been many sales of properties, the former owners moving away because of the serious water condition facing central Arizona.

Businessmen are casting a watchful eye on the term of events resulting from insufficient irrigation waters; extension of credit is more closely analyzed because of the obscure outlook and the difficulty people may have in meeting forward commitments.

The seriousness of our situation is apparent to every thinking individual and owner of Arizona interests or investments. We cannot overlook the interdependence of all industries, particularly the basic industry—agriculture.

For example, cattle raising embraces feeding and finishing in the

irrigated districts and the sheep industry through the winter months bring their flocks to the valley for feeding, where normally a plentiful supply of pasture is available.

Our mining communities depend upon the irrigated valleys for produce and dairy products. Our farm produce for the most part is ahead of other sections of the United States and is therefore vital—filling in at a time when most needed.

In the central Arizona and Yuma Valley areas, we enjoy a 12-month growing season and crops of varying kinds are harvested every month of the year. With a porous underground for movement of water, our soil can be kept sweet by use of irrigation waters and with adequate amounts and proper care, can produce crops for thousands of years to come, thus creating wealth year after year. This assures stability to investments, tax revenues and the home and cultural life of our people.

As an additional part of my testimony, I shall read into the record several letters received by me from three Arizona companies which reflect the general feeling of all Arizona businessmen toward Arizona's water problem and its effect upon the State's economy.

Because of the pressing need of supplemental irrigation water for our now cultivated lands, and to preserve our economic stability, the people of our State are united and determined in their efforts to secure the water benefits that rightfully belong to them.

They are convinced that Arizona has a definite and firm right to the water they are seeking to use through the enactment of H. R. 934, and I respectfully urge that this bill be enacted into law.

ALLISON STEEL MANUFACTURING CO.,
Phoenix, Ariz., February 4, 1949.

Mr. D. L. STAPLEY,
O. S. Stapley Co., Phoenix, Ariz.

DEAR FRIEND: I understand you are to testify before the committees of Congress in behalf of Arizona in her fight for legislation to secure our portion of Colorado River water. As the Allison Steel Co. is entirely Arizona owned and operated, I cannot emphasize enough the importance of the passage of this legislation to our company and to its approximately 600 employees.

We have spent many thousands of dollars in our industry, so that we may be able to meet any contingency presented by the continued growth of this area, which will be entirely lost if we do not receive supplemental water for our irrigated lands.

To emphasize the importance of this matter, to us, we are setting forth our annual sales in central Arizona, directly or indirectly, dependent on the stability of agriculture in this section of the State.

Mines	$650,000
State, county, city and Federal Government	500,000
Contractors	1,500,000
Industrial	300,000
Agriculture (produce procession equipment, lettuce sheds, etc.)	750,000

We have an annual pay roll of approximately $1,500,000, with most of our employees being small landowners, making us even more vitally concerned.

To those in other States who do not realize the far-reaching seriousness of our impending plight, we present our larger annual purchases of raw material and manufactured goods in other sections of the country:

California	$500,000	Chicago area	$300,000
Utah	250,000	Detroit area	90,000
Colorado	425,000	Ohio	55,000
Pittsburgh area	200,000		

We hope these few points will be of some value to you in presenting our mutual problem to Congress.

Yours very truly,

W. L. ALLISON, *President.*

MARICOPA TRACTOR CO.,
Phoenix, Ariz., January 20, 1949.

Mr. D. L. STAPLEY,
O. S. Stapley Co., Phoenix, Ariz.

DEAR DEL: Answering your letter of January 15, wish to advise that our farm machinery sales during the year of 1948 was $421,246.

The principal manufacturers that we represent are as follows: J. I. Case Co., Racine, Wis.; Jumbo Steel Products Co., Azusa, Calif.; Goble Disk Works, Fowler, Calif.; Wetmore Pulverizer & Machinery Co., Tonkawa, Okla.; W. W. Gringer Corp., Wichita, Kans.; Laird Welding Works, Merced, Calif.; B. Hayman Co., Los Angeles, Calif.; Eversman Manufacturing Co., Denver, Colo.; R. J. Piper Manufacturing Co., Princeton, Ill.

As you know, we sell practically all together to farmers and when they do not have sufficient water for irrigation they do not grow crops, and do not purchase farm machinery, and it indirectly hurts every merchant and every manufacturer in this country.

The water situation right ahead of us is the most critical in our history and we would hate to think of what would happen to this valley if this Colorado River water does not come some time in the near future.

Yours very truly,

M. J. VALENTINE, *Manager.*

PRATT-GILBERT HARDWARE CO.,
Phoenix, Ariz., January 15, 1949.

Mr. D. L. STAPLEY,
O. S. Stapley Co., Phoenix, Ariz.

DEAR DEL: In response to your letter of January 5, we have prepared the attached statement, which reflects our purchases of steel products and related items for the years 1942 to 1948, inclusive. Also included in this statement are the names of leading manufacturers from whom the purchases were made.

It might be contended that the figures presented are for an inflated period, inasmuch as the years for which they were compiled include the war years.

However, it should be borne in mind that during the entire war period, and since to a lesser degree, we were restricted in the total tonnage of steel, and most items made from steel, which we were permitted to purchase, either by directives or by allocations established by the producers.

The nature of our business is that of providing consumable and small equipment merchandise to industrial users, including the mines, smelters, lumber mills, utilities, cotton gins and oil mills, heavy construction, municipalities, shops, etc. Although we do a substantial volume of business in the Phoenix and Salt River Valley area, perhaps the larger volume of our business stems from areas outside of Maricopa County.

Our relationship with the farming trade is more on an indirect basis because we do not sell agricultural equipment, but do service shops which are repairing and building equipment for the agricultural industry.

Inadequate water supply for irrigation has already reflected in the volume of business we are doing currently in the agricultural areas.

Industry in Arizona is interrelated—what seriously affects one industry very quickly reflects in other industries. For example, cattle raising embraces feeding and finishing in the irrigated districts, and the sheep industry depends largely upon winter feeding in agricultural areas where a plentiful supply of pasture is available.

If the irrigated districts of Arizona, and I am speaking more especially of the central area where agriculture has been developed on a broad and diversified scale, is deprived of an adequate water supply, it will seriously affect the economy of the State in that the agricultural districts will be unable to bear their proportionate share of the taxes necessary for the State's operating expenses, and will thus throw upon other industries such a heavy burden of taxation that they will be handicapped in meeting competition in the production and sale of their products. I trust that the information furnished and the ideas expressed in this communication will be of assistance to you in the preparation of your paper in support of the central Arizona project, and wish to express appreciation to you for your willingness to undertake this public service.

Yours very truly,

ED. GOLLWITZER, *Secretary and Manager.*

ATTACHMENT TO LETTER OF PRATT-GILBERT HARDWARE CO., DATED JAN. 15, 1949

1942–48, inclusive:

Pipe, valves, fittings	$500,000
Screw fasteners	260,000
Steel items (steel, wire products, wire rope, drill steel, etc.)	2,100,000
Tools (precision, files, hacksaw blades, threading devices, abrasives, electric, wrenches, axes)	415,000
Transmission	215,000
Welding equipment and supplies	400,000

Manufacturers:
Air Reduction Co., New York City.
Smith Welding Equipment Corp., Minneapolis, Minn.
Stoody Co., Whittier, Calif.
Stulz-Sickles Co., Newark, N. J.
Bethlehem Steel Co., Bethlehem, Pa.
Jones & Laughlin Steel Corp., Pittsburgh, Pa.
A. Leschen & Sons Wire Rope Co., St. Louis, Mo.
Timken Roller Bearing Co., Canton, Ohio.
Russell, Burdsall & Ward Bolt & Nut Co., Port Chester, N. Y.
Allen Manufacturing Co., Hartford, Conn.
Rockford Screw Products Co., Rockford, Ill.
Republic Steel Corp., Cleveland, Ohio.
The Lunkenheimer Co., Cincinnati, Ohio.
Tube Turns, Inc., Louisville, Ky.
Stockham Pipe Fittings Co., Birmingham, Ala.
Browning Manufacturing Co., Maysville, Ky.
Chain Belt Co., Milwaukee, Wis.
Hewitt Rubber Corp., New York City and Buffalo, N. Y.
The Lufkin Rule Co., Saginaw, Mich.
Blackhawk Manufacturing Co., Milwaukee, Wis.
Parker-Kalon Corp., New York City.
Fayette R. Plumb, Inc., Philadelphia, Pa.
Cleveland Twist Drill Co., Cleveland, Ohio.
Van Dorn Electric Tool Co., Towson, Md.
Toledo Pipe Threading Machine Co., Toledo, Ohio.
Henry G. Thompson & Sons, Co., New Haven, Conn.
Delta File Works, Philadelphia, Pa.
Greenfield Tap & Die Corp., Greenfield, Mass.
The Carborundum Co., Niagara Falls, N. Y.
Ridge Tool Co., Elyria, Ohio.

Mr. MURDOCK. Thank you very much, Mr. Stapley.

We would like to ask you some questions, too.

I think I should reverse the order of questioning by the committee, beginning with the members who have more recently become members.

Are you a native son?

Mr. STAPLEY. That is correct, sir.

Mr. MURDOCK. I knew you were from a very famous pioneer family. You speak of Arizona's being able, if we can only get the supplemental water which we need, to produce for a thousand years?

Are there any such projects that have been cultivated and productive so long?

Mr. STAPLEY. I guess there are, Mr. Chairman, throughout the world. Of course, as you know, in our valley our prehistoric peoples farmed the areas years and years ahead of the white man and evidences are still there of the old canals that yet form a network of our valley.

Mr. MURDOCK. In fact, some of those prehistoric canals are used, are they not, to this day?

Mr. STAPLEY. That is correct, or our present canals follow right along the general contour.

Mr. MURDOCK. But those men have gone, they have been swallowed up by the desert?

Mr. STAPLEY. They are gone.

Mr. MURDOCK. What reason have you to believe that the present inhabitants will not follow the same course?

Mr. STAPLEY. If we rely upon the Indians, the few who remain there, it was the lack of water.

Mr. MURDOCK. It was the lack of water which drove them out. They were men of the stone hoe; they did not have blasting powder and power shovels and all those things which we have.

These men were not able to erect structures such as our engineering skill can do today.

You have sufficient confidence in our financing and business ability to think we can overcome the difficulties which overtook these prehistoric people?

Mr. STAPLEY. I think so, Mr. Chairman. We cannot only talk in acres, we have to talk in terms of the Commonwealth that has been established upon the present number of cultivated acres that we have.

Any reduction, of course, in that acreage means a corresponding reduction in our economic set-up.

It is just bound to follow.

Mr. MURDOCK. You think, then, that a dust bowl condition can be established which will have the same devastating effect upon part of our humanity that it formerly had?

Mr. STAPLEY. Yes.

Mr. MURDOCK. Mr. Barrett.

Mr. BARRETT. No questions.

Mr. MURDOCK. Mr. Aspinall.

Mr. ASPINALL. I have a question.

Mr. Stapley, in the formation of the economy of Arizona in the last 25 or 30 years, has there been a program on the part of Arizona to build toward this sort of a development?

Mr. STAPLEY. I would say "Yes" and "No." In fact no one foresaw the coming of a war and the location of training centers in our valley, so our vision did not extend really far enough to visualize the tremendous increase in population that would take place in our area.

So many boys were stationed at the fields and camps there and families came to visit them who were attracted by our country.

They have returned and made homes in our area. Of course, our growth has really been beyond anything we had anticipated.

Mr. ASPINALL. When did the first combined business intelligence of Arizona realize the difficulty with which you are confronted at the present time?

Mr. STAPLEY. I would say we would have to go back to the time that the Roosevelt Dam was contemplated.

The need then for water was very apparent, and after the passage of the Reclamation Act of 1902, the Roosevelt Dam was the first project I think initiated under that reclamation program.

Mr. ASPINALL. I appreciate that but I am referring in my first question now to this over-all development of the central Arizona project and ask you whether or not there was a program and when it originated.

Then the next question was supposed to be in line with that, when

did you first realize your difficulty in being overpopulated and being overdeveloped with your farming interests.

Mr. STAPLEY. Going back again to the building of the Roosevelt Dam it was visualized that other dams would be required on the streams providing the irrigation waters for our area.

These dams were added as money was available and the land was brought under cultivation.

It was pretty hard to measure the waterfall and the available surface water supplies to determine the limits of our cultivated areas.

The apparent need for these waters did come, I would say, just before the beginning of the war period when we had severe drought conditions but we were able to push through.

The development of lands during the war, and so forth, made it very apparent at that point that with continuing drought, something had to be done about it.

Mr. ASPINALL. When did Arizona decide that this project was something that they desired?

Mr. STAPLEY. There has been a mixed condition, I would say, as far as Arizona is concerned, but the real beginnings of what we are trying to do here today started about 3 years ago. That was the start of the big emphasis. This general idea has been in the minds of many people ever since the signing of the Colorado River Compact, but nothing definite was done about it until about the year 1939, at which time some businessmen got the then Commissioner of Reclamation, John Page, interested and preliminary surveys were started. This was interrupted by the war, and actually the concerted effort, resulting in this bill now before Congress, really got under way about 1944.

Mr. ASPINALL. That is all.

Mr. MURDOCK. Mr. Poulson.

Mr. POULSON. Now, the fact that you have overexpanded your economy down there and have enlarged beyond your capacity to take care of it and to which we are all sympathetic, is that still a basis for coming in and asking for a project costing $1,000,000,000 or more, which ultimately might not have the water when the matter is finally settled in the Supreme Court? Do you think that is justification on that alone, the basis that you have overexpanded?

Mr. STAPLEY. It is questionable whether we overexpanded our economy or not. The fact still remains, as far as Arizona is concerned, that we feel we have certain waters under the Santa Fe Compact available and it would certainly be up to Arizona to say what distribution she would want to make of those waters.

Mr. POULSON. You admit there is a dispute about those?

Mr. STAPLEY. We have to admit that after we listened to California for a day in relation to this.

Mr. POULSON. And the Secretary of the Interior stated so too, did he not, in his report?

Mr. STAPLEY. Of course, I think the Secretary of the Interior has more or less "passed the buck" as far as California and Arizona are concerned.

Mr. POULSON. He stated there was a dispute, did he not?

Mr. STAPLEY. He mentioned that, yes.

Mr. POULSON. And according to the 1944 Flood Control Act, these things must be settled before projects are carried out?

Mr. STAPLEY. That is the purpose of our being here, of course.

Mr. POULSON. The testimony would indicate that you have been a very successful businessman. Is it not true that this water will help the economy and make money, whether it goes to Nevada, New Mexico, Arizona, or California?

Mr. STAPLEY. I do not think that is entirely the point, Mr. Congressman.

Mr. POULSON. I just asked that question.

I point out the fact that you brought up a great argument which is the importance of the income taxes that would be denied the United States because of the fact that you were not able to expand.

The point I am bringing out and that you as a good businessman will admit, that it will make money anywhere and you will have to pay income tax in any State wherever you are.

Mr. STAPLEY. There is this important difference——

Mr. POULSON. Is that not true?

Mr. STAPLEY. There is this important difference: Our commonwealth is already established. Our industries are there. Our people are there. Our land has been reclaimed and so this is a rescue project that we are working on. Very definitely we must find waters to supplement our present supplies to take care of present irrigated lands.

Mr. POULSON. That still did not answer the question but I am going to ask you another one: If you say the water would make more money for the Federal Government in Arizona than it would in any of the other States, then you are inadvertently admitting that the benefits from this water will go into the hands of fewer people because they will pay higher income taxes than if it was distributed among a great many of the smaller-income taxpayers; is that not so?

Mr. STAPLEY. I do not think that is true, sir.

Mr. POULSON. You know that the Government gets more money from the higher-income people than from the lower-income people. Is that not true?

Mr. STAPLEY. No.

Mr. POULSON. Do you mean to say that when you make a higher income you don't pay a higher tax?

Mr. STAPLEY. That is correct, but the point I am thinking of is the distribution as far as people are concerned. As our commonwealth establishes itself, this thing is spread more. It is not just reducing itself to only a few.

Mr. POULSON. Then you would not pay higher income taxes on that same water in Arizona than you would in some other State. That is my point.

Mr. STAPLEY. That is perhaps true in that respect, but again we come back to the fundamental thing from Arizona's position and that is that we are entitled to certain waters from the Colorado River.

We say it is available and later will testify, substantiating that we are not now receiving the benefit of it.

Mr. POULSON. As a good businessman, do you think that the Government, and Congress represents the Government, should authorize a project which they know will cost the taxpayers of the United States $1,000,000,000 in the form of interest which is used to subsi-

dize your irrigation project over there, which equals the amount we put into the TVA, or which will equal the cost of the St. Lawrence seaway or 5 times the cost of the Boulder canal fund, or even the Panama Canal fund?

Mr. STAPLEY. If I did not think so, Mr. Congressman, I would not be here.

Mr. POULSON. Those figures will definitely be brought out by the engineering department, that that is what we eventually will contribute in the form of interest.

Mr. STAPLEY. I think as our testimony continues, the answers to your questions will be quite well developed.

Mr. POULSON. That is all.

Mr. MURDOCK. Mr. Bentsen.

Mr. BENTSEN. Is there any action in the courts to approve the water rights or has any action been initiated in California?

Mr. STAPLEY. We have initiated no action that I know of.

Mr. MURDOCK. Mr. Sanborn.

Mr. SANBORN. No questions.

Mr. MURDOCK. Mr. Marshall.

Mr. MARSHALL. Mr. Chairman, this question is beside the point, and I realize that it is. However, I would like to ask a question. I notice on page 6 of your testimony you say, "These factors, along with declining farm prices"—do you feel that farm prices are going to decline?

Mr. STAPLEY. They have declined.

Mr. MARSHALL. Yes; I realize that they have, but you are talking in terms here of a point that would make it unprofitable. Do you think that will be so?

Mr. STAPLEY. That will definitely be so. A point was brought up a few moments ago in the testimony of Mr. Akin. Of course, crop values are one of the determining factors, and in the pumping of water we have three power-plant units. We have electricity, we have natural gas, and also gasoline and Diesel fuel, for that matter.

Of course, the cost of each is different. It therefore depends upon what a man is using what his cost of pumping will be.

Some of the ranches are close to natural-gas lines, and they have the benefits. Others do not have that advantage. As I related in my testimony, it has cost up to $39 an acre in some sections for sufficient waters to raise an annual crop. With declining farm prices, prices could get down to such a point that the farmer could not afford to pay $39, or even $30 or $25, for his water, because he is at the point where there is no profit left to him, and there is only one answer.

Mr. MARSHALL. We know in times past that farm prices have taken some terrific slumps which make it difficult for farmers all over the United States to pay their operating costs, and your operating costs are considerably higher, no doubt, because of the cost of supplying water than they are in some particular areas.

However, I would like to call some things to your attention, because I do think it may relate to thinking in terms of irrigation and reclamation.

The population of this country is steadily increasing. The amount of available land is not increasing to any large extent. The fertility of our agricultural-producing land is dropping.

We are not carrying out in this country the conservation measures needed in order to maintain fertility of the soil. We are also becoming more and more an industrialized Nation, where our population is kept busy in supplying the needs of not only our country but the world.

In doing that, perhaps the income of labor is going to have the greatest single effect upon the price of agricultural products.

Personally, I am one of those who believe that in the welfare of this country, in maintaining a national income, that people will be employed—we had about 60,000,000 people employed some short while back, and that was unheard of before.

I am from Minnesota, which is not an irrigation area. However, I think we have to think in terms of doing everything we can to maintain the acreage of land in this country that can produce foods and fibers needed for the welfare of not only ourselves but future generations.

I can visualize in just a span of a few years where we are going to have a very difficult time feeding and clothing our own population.

I would like to say this, also, as a matter of observation, that a lot of our farm prices have been supported more or less at times by the amount of money which we have spent in re-creating, should we say, foreign markets.

My good friend over here, the gentleman from North Dakota—I would like to say to him in the next few days when we are going to be appropriating money for a plan to loan or give money to our European nations, that that is going to have a great effect upon the State of North Dakota's income, as well as my own.

Mr. LEMKE. May I answer that? You pay it in taxes. They take it out of one pocket and have a lot of wet nurses and take it over there and you have made more in the end.

Mr. MARSHALL. I think the answer is entirely determined in the amount of income which we get. It is my contention that I will take 50 cents out of my pocket and get a dollar in return.

Mr. POULSON. Who gives the other 50 cents?

Mr. MARSHALL. I am a farmer. I am interested in my farm income and I am interested in things in my State.

Mr. ENGLE. Will the gentleman yield to me?

Mr. MARSHALL. Yes, sir.

Mr. ENGLE. This is probably an irrelevant comment but it is in line with what the gentleman says: In 1947 we shipped to Europe 123,000 tons out of a total crop of 213,000 tons of dried prunes in California.

Our prune industry in California, which produces 90 percent of the prunes of the Nation—those prune orchards which it took years to grow—were set up on an anticipated export of between 40 and 50 percent of the crop.

When we got into this war everybody ate our prunes. After the war nobody could eat our prunes because nobody could buy them. The question we face is whether or not we are going to pull out our orchards and wreck our economy, or try to build up a few foreign markets in line with the program that the gentleman mentioned.

Mr. BENTSEN. Will you sell your prunes under the ECA?

Mr. ENGLE. We have. In 1947 we sold 123,000 tons of a total crop of 213,000 tons. The crop producers in California would have written red ink all over their books had it not been for the Marshall plan.

Mr. WELCH. Does my California colleague mean to create the impression that California desires to fill the world full of prunes?

Mr. ENGLE. Yes, and we would like also to send them some peaches, pears, and a great many other things.

Mr. LEMKE. Does the gentleman from California realize that the Nation furnishes the money and pays interest on it and at the end we are creating a bunch of beggars we will have on our back forever?

Mr. MURDOCK. The gentleman from Minnesota has the floor. The witness was getting ready to make an answer. Would you do that, Mr. Stapley?

Mr. STAPLEY. I would like to say this, that in regard to your statement, we have developed fertilizers that are very helpful in the production of crops.

We have learned a lot in the field of agricultural experimentation, so that yields are considerably heavier today than they were in the very immediate past.

Of course, there are still lands yet to be cultivated, for which water could be acquired. The fact remains that cotton has taken a reduction in price. It was about 38 cents and is down around 27 cents or 28 cents at the present time. The price of cattle of course is down. Oranges and grapefruit are priced at a pretty low level—particularly grapefruit. It is a drug on the market. We cannot get the money back out of raising it, and of course the price of alfalfa is down and there are many other agricultural commodities that are down in price right today over what they were a year ago.

Therefore looking back over the experience of the past and what is taking place right before us, there can only be one answer, it seems to me, and that is that we must anticipate that prices will go down.

I agree with you, that perhaps our markets are extended and there should be a bolstering effect but for how long? That is the problem. I do not think it can go on. The law of economics does not work that way.

Mr. MARAHALL. We have to take into consideration a long-and short-time view in determining an answer.

Certainly we have had through the Midwest where I am from, some very good crop years where there was excellent production.

Climatic conditions have been very favorable. I certainly agree with the gentleman that we have learned a lot through chemicals, fertilizers, and insecticides, and so forth, which take a lot of risks out of farming.

However, I still know that we are going to have to do continually more of it if we are going to maintain our production.

The reason I raised part of this question is that I think agriculturally, Arizona, Minnesota, California, and the rest of these States, if they are going to prevent a collapse in our economy, we better find ways and means of maintaining our national income at a high level.

Mr. STAPLEY. I agree with that.

Mr. MURDOCK. In that connection, you did a good job in showing the interrelationship between business in Phoenix and Mesa and the rest of the country by your tables here. Is there not the same relationship in the disposition of our agricultural production?

Mr. STAPLEY. I would think so, yes, sir.

Mr. POULSON. Mr. Chairman, since you have brought that problem

up and since you have shown how much you bought from California, you did not show the figures of how much you sell the cattle for.

Is that not one of your chief markets?

Mr. STAPLEY. You will get that information during the course of our testimony, Mr. Poulson.

Mr. MURDOCK. Mr. D'Ewart.

Mr. D'EWART. I yield to the gentleman from California, Mr. Engle.

Mr. ENGLE. I have just one question in regard to the financial aspects of this project: He read a statement made by Senator McCarran, of Nevada. I read that to Mr. Akin. The Senator made another statement before the Senate committee which reads as follows:

> Under the plan set up by the bill, no part of the capital cost will be repaid by the Arizona irrigators. Either the Federal Treasury or the power users are expected to pay for it all. The water will be sold to the irrigators at $4.50 per acre-foot, which, according to the Reclamation Bureau, is less than the cost of operation and maintenance alone.

Without discussing whether or not that is true, but assuming that it is true for the purposes of this question, as a businessman do you think it is a sound proposition to set up a project where the land cannot even pay the cost of the operation and maintenance of the project without any reference at all to paying off the capital investment?

As a businessman would you go into that kind of a deal?

Mr. STAPLEY. I would prefer not to answer that, because it is an assumption, and I see nothing to be gained by it. I think the evidence that will be presented later will answer your question.

Mr. ENGLE. We expect to determine before this case is over whether or not the statements made by the Senator are true. He also stated that this is the first project in the history of this Nation in which Congress had been asked to authorize a project where the irrigators are unable to repay any part of the investment and are unable to pay even the operating cost and the cost of pumping.

Now, I am not asking you to say whether or not that is true. That statement that Senator McCarran made is diametrically opposed to the statement made by Mr. Akin just a few minutes ago. What I am asking is, If it is true, do you think it is a sound project?

Mr. STAPLEY. Again I prefer not to answer it because it is still an assumption. It is Mr. McCarran's opinion and whether he is right or not is a question to be decided, and I think the statement made by Mr. Akin, of Arizona, the evidence presented here will sustain Arizona's cause.

Mr. MURDOCK. Mr. D'Ewart.

Mr. D'EWART. I believe I will pass. I was going to comment on some of the statements Mr. Marshall made.

Mr. MURDOCK. Mr. Lemke.

Mr. LEMKE. I just wanted to make a suggestion. I am for this project but there is something I want cleared up. I understand this compact that was signed was even more binding than a marriage price where the young lady takes you for better or for worse, mostly for worse. I know no way you can get out of this. You are in it.

Now, I want to be shown, and I do not say that you cannot show it, that you have enough water to fill that reservoir and you have a legal right to it. I do not want to build a big dam and then have California take it all away from you anyway.

Mr. STAPLEY. Your question will be answered in the testimony to be presented at these hearings.

Mr. MURDOCK. Mr. Morris.

Mr. MORRIS. I do not intend to ask questions at the time, but later on there will be several questions.

Mr. MURDOCK. Mr. Welch.

Mr. WELCH. No questions.

Mr. MURDOCK. Mr. Engle.

Mr. ENGLE. No questions.

Mr. MURDOCK. The Chair would like to say that we have fixed the order of the hearings in such a way that these businessmen can be heard as expeditiously as possible, that they can go about their business, of course.

Naturally, right now we are emphasizing the need phase of this matter.

However, I imagine, Mr. Stapley, that all of your statements and those of Mr. Akin and other witnesses to come are based on the assumption that we have water in the Colorado River rightfully belonging to us, and your emphasis here is that we need it and need it now. Is that correct?

Mr. STAPLEY. That is correct, Mr. Chairman.

Mr. POULSON. Mr. Chairman, I think you made one of the best statements that has been made yet. We agree that there is a need. You stated that it is made on the assumption—and the word "assumption" is the basis of our disagreement.

Mr. MURDOCK. Thank you very kindly, Mr. Stapley.

I am informed that there will be 3 hours of general debate in the House on the oleo bill today.

We will meet at 9 o'clock tomorrow morning and the committee stands adjourned until that hour.

(Whereupon, at 12: 08 p. m., the committee adjourned, to reconvene at 9 a. m., Friday, April 1, 1949.)

THE CENTRAL ARIZONA PROJECT

FRIDAY, APRIL 1, 1949

HOUSE OF REPRESENTATIVES,
COMMITTEE ON PUBLIC LANDS,
SUBCOMMITTEE ON IRRIGATION AND RECLAMATION,
Washington, D. C.

Met, pursuant to adjournment, at 9 a. m., the Honorable John R. Murdock presiding.

Mr. MURDOCK. The committee will come to order. We will continue hearings on H. R. 934. This is an early hour and full attendance can hardly be expected at 9 o'clock, but we have so many witnesses from out of the city and from the Far West that we would like to hurry along with the hearings.

Our last witness was Mr. Stapley, a businessman from Phoenix and Mesa and other valley towns. I did want to ask him a few questions myself but we did not have time yesterday. Possibly we could have him here yet.

As it was announced, this plan of furnishing supplemental water to the central Arizona area includes water not only for the Salt River Valley around Phoenix, but for the central Gila Valley around Florence and Coolidge, and even farther south, in the valley of the Santa Cruz River. As has already been explained by witnesses, through an exchange of water we hope to furnish supplemental water to a very large area that cannot receive the water because it is somewhat higher than the water that will be furnished for irrigation under this plan.

We are glad to have with us this morning Mr. Francis I. Curtis, a farmer of Eloy, Ariz., who will discuss briefly the system of farming in the Santa Cruz Valley. Mr. Curtis.

STATEMENT OF FRANCIS I. CURTIS, ELOY, ARIZ.

Mr. CURTIS. Mr. Chairman and members of the committee, my name is Francis I. Curtis. I am a farmer and my residence is Eloy, Ariz. I have a farm located on the Santa Cruz Delta south of Eloy on which there is one well.

This delta is an alluvial deposit of rich bottom land laid down by the Santa Cruz wash. This area was originally opened up by vegetable producers back in the middle twenties, before the failing water table brought about the increase in irrigation pumping costs. There are still about 2,000 acres, however, in the upper reaches of this river land devoted to the production of asparagus, carrots, broccoli, and peas, grossing over a million dollars annually.

The Eloy area, of which this is a part, comprises some 150,000 tilled

acres and includes the towns of Eloy, Toltec, and Pichaco. In this community there are three vegetable packing and shipping plants and five cotton gins. The output of these gins will amount to approximately 59,500 bales which, including the seed, will gross in excess of 9 million dollars this year. It is estimated by local feeders that there are over 20,000 head of cattle being fed in the community this winter on barley and alfalfa pasture.

I might mention right here, Mr. Chairman, that this paper was prepared a few weeks ago.

Mr. MURDOCK. You would like to revise it?

Mr. CURTIS. No; I just wanted to add that our seasons change and the cattle are in. The thing that struck me at that particular point is there are a number of head brought in there to graze off the cotton stalks, and it is probably over the 20,000 head.

Mr. MURDOCK. We understand that these valley areas are centers for a large part of the grazing land around about.

Mr. CURTIS. Yes, sir.

Mr. MURDOCK. And they are used as centers for winter feeding and that sort of thing.

Mr. CURTIS. There is shipped from this vicinity an average of 500 carloads of grain, grossing in the neighborhood of $1,250,000 annually.

At the age of 7, after a 4-day trip overland from Mescalero, N. Mex., in my father's model T Ford, we settled in this valley. It was in those days supported by a few cow outfits, some scattered mines in the mountains to the south, two Indian reservations, and a number of homesteaders. There were a few cultivated acreages in the valley irrigated from shallow wells. My father homesteaded a piece of land in the lower end of the valley and I rode 6 miles to school on a mule. Later I acquired from my father the land he homesteaded and used the proceeds from the sale thereof to help pay for the land I now own.

Mr. MURDOCK. Would you mind telling us about what date that is, without revealing your age?

Mr. CURTIS. The date we came in there was the year that you mentioned yesterday, of 1914.

Mr. MURDOCK. That establishes your age too.

Mr. CURTIS. I have watched the Eloy area develop from a plain dotted with homestead shacks and an occasional cow camp, into a substantial farming community, supporting three grammar schools and a high school, with busses bringing students in from farms over a fine network of surfaced county highways. We enjoy a theater and have our own local newspaper.

The economy of this community is based solely upon one industry, agriculture. There is only one threat to our economy—our wells are failing. We are on the threshold of the sort of thing that results from any other failure, such as a failing river levee or a range failing in freezing weather. It is only natural that we look to our Government at a time like this. We need a lift, not a haylift, a water lift.

Without supplemental water for these lands, investments by individuals, businessmen and farmers like myself, amounting to over 15 million dollars in this community alone, will revert to the picture which greeted me over 33 years ago when I first saw the Casa Grande Valley. In my own case it will mean the loss of the lifetime effort of two generations, my father's and mine.

Now if we are unsuccessful in our mission here, it will be that same mule that will be taking our youngsters to school. Perhaps from him, this hybrid who boasts neither pride of ancestry nor hope of posterity, our children may absorb enough of that stubborn determination, courage, and hardiness to enable them to start over again.

Mr. MURDOCK. We thank you, Mr. Curtis. You will not have any difficulty in believing me when I tell you that instead of a Model T Ford I drove one of the old Overlands—you remember them—with the V-shaped springs front and rear. I drove one of those over an Indian Reservation.

Mr. CURTIS. I do remember them.

Mr. MURDOCK. That was when it was not the green, fertile area that it later became. I carried water in a can on the running board for the safety of my family. That, of course, may be strange to some of the folks here, but those are the conditions that you saw and I saw when we both entered the State of Arizona in 1914.

Are there any questions that the members of the committee would like to ask Mr. Curtis?

Mr. MARSHALL. Yes, I have a few questions that I am rather interested in asking.

About what is the average size of the farms in this valley that you are talking about?

Mr. CURTIS. The average size of the farms, Mr. Marshall, was originally based upon the size of the well that was brought in when they drilled. This is primarily a pumpting district in there. Farms originally were around 300 acres, I would say, roughly speaking, to a well. The cost was usually figured on water at approximately $100. That is what it cost to put your water in there. In later years, however, the size of the cultivated acreage has gone down because these wells are not delivering the amount of water that they were originally, and the lift as well has increased. In other words, the well that was pumping from one level originally, is lower.

Mr. MARSHALL. You mentioned growing vegetables. On a 300-acre farm, how many men is it necessary to employ during the growing season?

Mr. CURTIS. On the Henry Hind ranch, I imagine there are in the neighborhood of 60 to 80 people there.

Mr. MARSHALL. Who are these 60 to 80 people? Are they imported in there, or are they natives?

Mr. CURTIS. They are farm laborers, and perhaps a couple of foremen.

Mr. MARSHALL. They are principally natives of that area?

Mr. CURTIS. Yes, sir. Now, I would not say they were born there.

Mr. MARSHALL. But they make their living there the year around?

Mr. CURTIS. Yes.

Mr. MARSHALL. On the first page of your testimony you talked about feeding 20,000 cows or head of cattle. I am not sure in my mind about that. Are those cattle that are brought in there to winter?

Mr. CURTIS. There are a lot of them brought in there for the winter; yes. We raise quite a bit of alfalfa in and about Toltec and Eloy, up near the center of this alluvial delta formation which I described. There is a number, or quite a few cattle, that are brought in there every year to feed on that alfalfa and barley. There is a mixture

of alfalfa and barley, and in some places they are straight barley and straight alfalfa. It is harvested later, some in the late spring and early summer.

Mr. MARSHALL. Where do these cattle go then? Do they go on to the market to feed?

Mr. CURTIS. Yes. Some of those go to feeding pens for finishing. They are not finished there. Some go to feeding pens at Los Angeles and Phoenix. There is a good-sized packing plant at Phoenix and different points.

Mr. MARSHALL. When you bring them in to feed, where do they come from?

Mr. CURTIS. There are a number of dealers in and about Phoenix and Tucson, and through those little towns there. I do not know just where they do bring the majority of them from. I know a lot come in from Texas and Oklahoma and various places. I would not be able to say as to the ratio, though.

Mr. MARSHALL. You were mentioning in your statement something about cotton, to the effect that you have 59,500 bales?

Mr. CURTIS. Yes, sir.

Mr. MARSHALL. Is my understanding correct? Is that all long-staple cotton?

Mr. CURTIS. Oh, no, sir. I would say that practically all of that is short staple.

Mr. MARSHALL. In other words, you are in some competition with the cotton States farther east, in that regard?

Mr. CURTIS. We are; but in over-all quantities I do not think we are hurting them too much.

Mr. MARSHALL. It is just a small quantity.

Mr. MURDOCK. Will my colleague yield for a moment?

Mr. MARSHALL. Yes, sir.

Mr. MURDOCK. We have great difficulty here in getting ourselves in step with the various committees. There is a meeting of the full committee at 9:45 a. m. today. I was rather hoping to get these men from the Eloy district on the stand first. If you do not mind withholding your questions we will not let this witness get away until we hear from some other witnesses, and then you can put your questions to them.

Mr. MARSHALL. It is certainly agreeable.

Mr. MURDOCK. Would you hold that question, please?

Mr. Curtis, please do not leave as we may want to ask you some further questions.

Mr. CURTIS. I will sit right here in back.

Mr. MURDOCK. Mr. Van Wagenen.

Mr. Van Wagenen, I believe, is one who helped to develop this area in the Eloy country and the Santa Cruz country.

STATEMENT OF A. VAN WAGENEN, JR., PINAL COUNTY, ARIZ.

Mr. VAN WAGENEN. Mr. Chairman and members of the committee, my name is A. Van Wagenen, Jr., and, as the chairman stated, I do feel that I did help to develop the country around the Casa Grande Valley. When I came to Arizona about 25 years ago as a young lawyer, I was instrumental in helping to get organized three electrical districts by

which power was brought in and used to pump water for irrigation. I have continued to work along that particular line continually, ever since, although in the last 10 years, I guess, I have kind of half way turned farmer and have confined most of my legal work to just assisting the electrical districts.

In deference to the committee and at the request of one of the committee members, Congressman Lemke, yesterday, that the matter be speeded up a little bit as far as the presentation by lay witnesses is concerned, I have been asked to just file my paper instead of imposing myself on the committee too much today, and just make a brief statement in lieu thereof.

I would like to call the committee's attention to one point that I have not heard brought out at any time while I have been here, although I have been here only a short time, and it may have been covered, although I have not heard it mentioned.

If you will bear with me I will just read a short excerpt, starting at the last paragraph on page 4 of my statement, which runs for a couple of paragraphs.

In eastern States where rainfall is plentiful, rivers are of value to drain off surplus water. In the arid West the opposite is true. Water is a natural resource which, when applied to the land, is more valuable than the minerals which are mined or the oil which is reclaimed from subterranean sources. One acre-foot of water placed on Arizona land will produce an average of $50 in agricultural products.

The point I especially wish to emphasize is that this wealth is gone and it can never be recovered. Our copper, oil, and coal remain as permanent natural resources until they are mined. Not so with the water of the arid West; unless it is captured before it reaches the ocean, it is lost, never to be recovered.

Some place I heard, while I have been in the hearing room, that there are about 8,000,000 acre-feet of water a year flowing into the Gulf. That means there are about $400,000,000 in natural resources that we in the United States are letting go into the Gulf, and when that is gone, it is gone, and there is no way of getting it back.

As I stated, oil and copper and coal remain there, but this is a natural resource that, while we are bickering here, we are letting it go to waste and it is gone forever.

Mr. ENGLE. Will the gentleman yield for a question?

Mr. VAN WAGENEN. Certainly.

Mr. ENGLE. Do you mean to imply that there is more water in the Colorado River than there are commitments for that water?

Mr. VAN WAGENEN. Congressman Engle, I have not made a study of that and I am not qualified to answer it, I believe. We do have witnesses here on that. I have not made a study of the engineering part of it.

Mr. ENGLE. Of course, the practice is that the upper basin States are now using only about a third of their water, and Mexico, which is entitled to a large allocation of water, is only using half of it. Regardless of what we ever do, we are going to have to even up the water in the Colorado River to service the Mexican treaty, whether they use it or not. It is going to have to be there and we cannot build facilities in Arizona and California, or any place else, which take away the water which the upper basin States are entitled to, because if we

build those facilities, as Mr. Lemke said the other day, we will be sitting here high and dry.

In other words, the upper basin States are entitled to 7,500,000 acre-feet of beneficial and consumptive use of water. The water they are entitled to may flow for the next 30 years out into the Gulf of Mexico, but there is not anything those of us in the lower basin can predicate the construction of an irrigation project on with relation to that water. If we do, when they get ready to use it they are entitled to it and they will take it, so there is no way that I know of to stop the waste that you speak of.

Mr. VAN WAGENEN. I think the only way it could be stopped is to proceed with the development of both the lower and upper basin. Until we do proceed with that in full, I think we are going to lose all of those natural resources.

Mr. ENGLE. I agree with you on that.

Mr. VAN WAGENEN. And we are trying to get started on it now.

Mr. MILLER. Is the witness prepared to say whether the Reclamation Bureau said this was feasible?

Mr. VAN WAGENEN. No. I have not read the report.

Mr. MILLER. Or what the cost would be per acre if it were feasible?

Mr. VAN WAGENEN. No. I have not made a study of that. I am sorry.

Mr. POULSON. Mr. Chairman, may I ask a question?

Mr. MURDOCK. Yes.

Mr. POULSON. For your main testimony then, you intend to be to the effect that you need the water. Is that it?

Mr. VAN WAGENEN. That is primarily it. Yes, sir. I am very closely associated with the farmers in Pinal County and I know their needs, and they do desperately need additional water.

Mr. POULSON. Now, you are telling us how much they produce—an average of $50 in agricultural products. That money is lost. Now, as my colleague, Mr. Engle, brought out, the first thing to do is to know how much water is available. The main dispute is between Arizona and California as to the amount available, whether it belongs to Arizona or whether it belongs to California. But since you have brought out this matter that it produces $50 in agricultural products, and that is money that is lost, you would not say that it would not bring any values at all over in California when it is used there, would you?

Mr. VAN WAGENEN. No. I would say if it is put in California it would but the Bridge Canyon Dam is wholly within the State of Arizona, both the dam and the basin entirely. I cannot imagine Arizona asking California for part of their central California project water.

Mr. POULSON. Yes; but the point is you are taking water which incidentally belongs to California. In other words, as the Secretary of the Interior said, there are two different contentions. If Arizona is right, she has the water. If California is right, there is not enough water in the Colorado River for this central Arizona project. So, while we are not arguing about the need we still have to go back to the original contention and to the real basis of this whole problem, which is, Is there enough water?

As Mr. Lemke brought out on the question of there not being enough

water, we certainly do not want to spend $138,000,000, which is not even the entire cost, but which is the cost of the project, leaving out the amount of the aqueduct which is to be built. As was brought out later on, the interest on that money which is to be used to pay for the construction of this aqueduct, which would be used to liquidate that, will not be paid into the Treasury but will be paid in to liquidate that amount of principal due on the aqueduct with the irrigation facilities, and the Government then will be putting up the interest on this amount, which will amount in 78 years to close to $1,000,000,000 which the Federal Government will be contributing to the State of Arizona for this irrigation.

So how many years is it going to take to pay this back on that basis alone?

Mr. VAN WAGENEN. I have not made a study of that, Congressman. I would like to see a study made of that in comparison with the Central Valley project as to what it would take to pay that back and what percentage the irrigators pay in the Central Valley project. Could you answer that question? It will be informative to me because I do not know the answer to either question.

Mr. POULSON. That has been paid back for years and that has been paid back on the same basis. There is no dispute over the water there.

Mr. VAN WAGENEN. We did not think there was here.

Mr. POULSON. But here there is a water problem.

Mr. MURDOCK. I think in order to facilitate the matter, Mr. Van Wagenen, that you might hold yourself in readiness to answer questions. This subcommittee is handicapped for time.

At this point we will insert your statement in the record.

(The matter referred to is as follows:)

STATEMENT OF A. VAN WAGENEN, JR., PINAL COUNTY, ARIZ.

My name is A. Van Wagenen, Jr. I came to Arizona in 1922 and located at Casa Grande in Pinal County and still maintain my legal residence in Pinal County.

Pinal County joins Maricopa County on the south. The Gila River flows through the county from east to west and joins the Salt River about 15 miles to the west and a little south of Phoenix.

Casa Grande, along with Coolidge, Florence, and Eloy, are small towns serving the farming community which is located in what is known as the Casa Grande Valley. The floor or plain of the valley runs about 75 miles in a northwesterly and southeasterly direction and is almost 50 miles across at its widest point.

The Casa Grande Valley has very fertile soil. It is, on the whole, a remarkably level plain and merges into the fertile Salt River Valley south of Chandler. In driving from one valley to the other it is impossible to recognize any geographical or physical division. Both valleys have the same climatic and rainfall conditions; both valleys are blessed with large areas of level fertile ground and have about the same elevation, and, in fact, the economic, social, and agricultural development of the two valleys are inseparable.

The greatest difference between the two valleys is the fact that the Salt River Valley in Maricopa County is served with irrigation water from the Roosevelt Dam on the Salt River, while the gravity irrigation in the Casa Grande Valley is served with irrigation water through the San Carlos irrigation district and from water stored by the Coolidge Dam on the Gila River.

The Coolidge Dam is intended to serve gravity water to approximately 100,000 acres of land in the valley, one-half belonging to the Pima Indians and the other half belonging to white settlers.

In addition to the gravity lands being served, individual farmers have reclaimed the desert by drilling wells and pumping water for irrigation. In this manner nearly 250,000 acres of additional farming land have been brought into

cultivation and have furnished homes and independence for thousands of farm families, among whom are included many veterans of both the First and Second World Wars.

I, myself, came to the Casa Grande Valley shortly after being discharged at the end of the first war. I practice law at Casa Grande and handled the legal proceedings in the organization of municipal electrical districts to bring electricity to farmers for pumping water for irrigation, and am now legal representative for two such districts.

I have, therefore, had an opportunity to watch closely the development of the Casa Grande Valley for the past 25 years. I have seen the pioneers who have gone out on the hot desert, have cleared away mesquite, greasewood, and cactus, and invested their savings in a well and pumping plant to change it all to green fields, homes, and productive farms, farms that helped produce the fiber, food, and feed so badly needed during the last war.

During the last few years I have noticed many tracts of land in central Arizona that are under cultivation and irrigated by gravity water. Many of these fields were planted to alfalfa, much of which is now dead for lack of water, and on the rest there are grazing hungry, lean cattle trying to nibble the last sprigs of feed, and the farmers who are farming these fields are trying to pay expenses on a production basis of farming 4 or 5 acres and producing only as much as normally would be produced on 1 acre.

The farmers who pumped water for irrigation have been forced to drill new wells, deeper wells, and lower their pumps to follow the falling water tables. All this has been brought about because the farmers have not had available water sufficient to irrigate the cultivated lands. Reservoirs have gradually been depleted, the underground water supply has been called upon for more than ordinary demands to make up for the lack of surface water; water tables are falling and our farmers are facing disaster.

Experience has shown that even abnormally large rains only bring temporary relief so we know now that either we must have supplemental water from the Colorado River or a large portion of the presently developed lands will go back to the desert and ghost towns will appear on the returned dry plain.

The lands surrounding Eloy, which is in the heart of the Santa Cruz flood plain, are among the most fertile in the State or Nation. Millions have been spent in developing this land; modern grade and high schools have been built and the area dotted with substantial farm homes. Water was obtained by drilling and equipping wells for irrigation from the underground basin. However, during the past few years the water table has been dropping dangerously—not solely from local pumping but also because of pumping upstream and by the adjacent San Carlos project to supplement its gravity water. This area has approximately 150,000 acres of improved farm land most of which will go back to the desert unless pumping can be supplemented with gravity water from the Colorado River.

We farmers—for I am mainly a farmer—visit the Colorado River, where we see the water flowing peacefully into the Gulf of Lower California. We see the great Boulder Dam which regulates the flow of a part of the water into the Imperial Valley of California to irrigate hundreds of thousands of acres with such a plentiful amount of water that a million acre-feet is wasted into the Salton Sea each year. We know that practically all of this has been accomplished with funds furnished or loaned by our great Government.

In central Arizona we only need a small portion of the remaining water that continues to flow, and will for many, many years continue to flow into the Gulf to be lost forever, not only to us but to the whole United States.

In Eastern States where rainfall is plentiful, rivers are of value to drain off surplus water. In the arid West the opposite is true. Water is a natural resource which, when applied to the land, is more valuable than the minerals which are mined or the oil which is reclaimed from subterranean sources. One acre-foot of water placed on Arizona land will produce an average of $50 in agricultural products.

Every year millions of acre-feet of water go down the Colorado River to the Gulf. This means that, not only Arizona but the whole United States has lost millions of dollars of potential wealth which would have gone to labor in producing and processing farm products. This wealth is gone; it can never be recovered. Our copper, coal, and oil remain as permanent, natural resources

until they are mined. Not so with the water of the arid West. Unless it is captured before it reaches the ocean it is lost, never to be recovered.

Arizona is asking that only about 1,000,000 acre-feet of water each year be brought into the central portion to save the present population and development. The cost of the project will be paid back to the Government time and time again during the life of the project. This cannot be denied. Must we in Arizona, with our parched lands, watch the waters of the Colorado continue to flow on through our State to the ocean because of lack of constructive action?

Our only hope is congressional action. Therefore, we are now before Congress seeking that aid. Passage of the legislation now being considered by this committee will save us.

Mr. MURDOCK. I will call one more witness before we turn this meeting over to the full committee. We have another outlying area that will be benefited by an exchange of water. That is the upper Gila area.

We are glad to have as a witness this morning Judge Udall from Thatcher, Graham County, Ariz.

STATEMENT OF JESSE A. UDALL, ATTORNEY AT LAW, THATCHER, ARIZ.

Mr. UDALL. Mr. Chairman and gentlemen of the committee, I live over in the Gila Valley in eastern Arizona in the town of Thatcher. The valley I come from is frequently referred to as Safford Valley. I have lived in Arizona all of my life and I am a veteran of both world wars and a graduate of the Law School of the University of Arizona.

I come here this morning, however, not to testify as a legal expert, because I have not made a study of that phase of it. I come as a lay witness, since I am a property owner and a farmer and, I of course do practice law. I have held quite a number of public offices in my county and at the present time I am a member of the Interstate Stream Commission of the State of Arizona.

Mr. MURDOCK. I would like to make this one little statement before you go forward. It is plainly evident here that there are several aspects to this problem. What we are trying to establish now is the need aspect. The others will by no means be neglected. Let me say again what I said previously, and I want to impress this upon all present: The full study of Arizona's case has never been presented to this committee nor to the House of Representatives. No final judgment can be made in this matter until the facts are presented and that is why we have to go into these rather extensive hearings.

Please proceed, Judge.

Mr. UDALL. My experience with reclamation and the diversion of water on arid lands dates back to my early boyhood, when all the people of the town of St. Johns and other towns in northern Arizona banded together in a community enterprise to build dams on the Little Colorado River and divert the water onto virgin lands.

In the year of 1935 a consent decree was entered in the Federal court of the district of Arizona, in which water from the Gila River was decreed to lands in Greenlee, Graham, Pinal, and Gila Counties in

Arizona and Hidalgo County in New Mexico. The lands so decreed, beginning with the upper reaches of the river, are as follows:

	Acres
The Virden Valley in New Mexico	2,860
The Upper Gila in the vicinity of Duncan, Ariz	5,201
The Safford Valley in Graham County	32,512
Total lands in Upper Gila	40,573
The San Carlos, Apache Agency	1,000
Below Coolidge Dam, Winkelman Valley	1,335
San Carlos project in the Florence, Coolidge, Casa Grande area:	
Indians	50,546
White	50,000
Florence, Casa Grande project	1,544
Gila crossing	2,992
Total lands decreed on Gila River	147,990

The supply of irrigation water derived from the Gila River during the years of 1938, 1939, 1945, 1946, 1947, and 1948 was entirely insufficient for a stable agriculture. During the other years of that period there was sufficient water to carry on.

To meet the lack of irrigation water from the Gila River, it has been necessary to supplement the water supply by pumping from underground sources. However, the sources of underground water are very irregular and spotted in the Safford and Duncan Valleys. As as result, some of the land in these two valleys receive sufficient supplemental water to assure maturing crops, whereas many hundreds of acres in these two valleys are inadequately watered.

It is now becoming generally recognized that Arizona is one of the most desirable places to live in the United States. Its mountains and deserts, its sunshine and pure air, its desirable summer and winter climates are attracting new citizens by the thousands.

It has experienced a most remarkable growth in population during the last several years. From April 1940 to January 1947 its population has increased 37.3 percent. (See the United States News, Mar. 28, 1947.) This increase is one of the greatest that has been made by any State in the Union. Of the new population coming to Arizona, many thousands are ex-servicemen from other States who have come here to make their homes. In most instances these returned servicemen are attracted to Arizona after having spent a period of time in training within its borders.

From a survey made by the Valley National Bank and published in a recent issue of Arizona Progress, it is shown that there are 84,000 veterans of World War II now residing within the boundaries of Arizona. Of this number, more than one-third have migrated from other States since leaving military service. The publication goes on to say:

> Veterans and their families are potentially great assets to the State. However, their absorption into our economy creates problems that call for considerable patience on the part of the veteran and plenty of serious planning on the part of the State leaders.

The Upper Gila Valleys in Graham and Greenlee Counties, like all the rest of Arizona, are faced with this very serious dilemma, an increasing population with a diminishing supply of water for the irrigated valleys that have been reclaimed from the desert by the toil, courage, and faith of the pioneers during these many decades past.

For the years of 1946, 1947, and 1948, the farmers of the Safford Valley under the terms of the decree, were able to divert from the Gila River the following quantities of water:

69,900 acre-feet for 1946;

51,978 acre-feet for 1947; and

39,848 acre-feet for 1948, for the 32,512 acres of decreed land.

This supply was supplemented by pumping in some areas where underground water was available, but about one-third of the irrigation wells in the valley failed entirely in 1948. Hundreds of acres of land, however, did not have access to adequate underground sources of water, and these lands in the upper Gila Valleys are on the verge of reverting back to the desert. The sight of burning crops, dying trees, and parched lands that once were fruitful, makes a close observer wonder if this generation is keeping faith with the generation of pioneers that carved an empire out of the deserts. It also raises the question as to what this generation's responsibility is to the next.

Mr. MURDOCK. If I may interrupt, the witness before us is of that generation, I happen to know, as well as the witness who was last with us yesterday. These men came in there then as native sons, and they certainly know what they are talking about when they speak about carving homes in the wilderness.

Go ahead, Judge Udall.

Mr. UDALL. Due to the extreme droughty conditions prevailing in Arizona in 1948, the farmers in the Safford Valley were only able to raise good crops on approximately 14,000 acres of land that was planted to cotton. Approximately 12,000 acres of land planted to alfalfa, grain, and pasture, yielded only one-fourth of the usual crop. The remaining acreage of 6,512 stood idle and was entirely unproductive for the year 1948. It should be pointed out also that the yield on the hay, grain, and pasture lands was so small that the operation ran at a loss for the year.

If the agricultural valleys of Arizona are to be preserved for the peoples that are now here and the prospective citizens that are coming here in the future, it is imperative that additional sources of water be brought into central Arizona for distribution on the lands that are already under a high degree of cultivation. In Arizona it isn't acres, but acre-feet that spell prosperity and progress. If a million acre-feet of water, more or less, could be brought into the Salt River and Casa Grande Valleys from the Big Colorado, farmers in Graham and Greenlee Counties could be benefited directly by retaining and receiving additional quantities of water by being permitted to divert a larger proportion of the water of the Gila River, than they now receive, and in turn the farmers in the Casa Grande Valley could be compensated therefor by water brought from the Big Colorado River. By this exchange of water, all lands presently or heretofore irrigated from the Gila River and its tributaries, would be insured an adequate supplemental supply of water.

It should also be pointed out that this legislation now pending before Congress which contemplates the bringing of water from the Colorado River into central Arizona, outlines in general terms the building of additional storage dams on the Gila River. The construction of such dams at proper places so as to be readily accessible to the valleys sought to be served, would greatly stabilize agricul-

ture in the Upper Gila, Safford and Casa Grande Valleys, and sufficient quantities of water could thus be stored to be released in the dry season of the year, when crops are most likely to be lost because of the lack of water. Thus, by the exchange of water and by the storage of supplemental water to be used in the dry seasons of the year, all of the lands presently or heretofore irrigated from the Gila River would be benefited and stabilized.

Several of the Colorado River Basin States consider the Colorado River to be one of their greatest natural resources. That is especially true of Arizona, because it is the only river of any size in the State, and it drains practically all of the area of the State, and because it can furnish additional water for the irrigation of lands already redeemed and power for industrial growth. If each of the States of the Colorado River Basin are permitted to utilize to the fullest capacity their respective interests in the Colorado River, the future growth of each State will be founded on a sure foundation, and in addition thereto the interests of the Federal Government will be greatly enhanced.

It is more to the interests of the Government to have agriculture and industry strong in each of the States of the lower Colorado Basin where centers of population can thrive and grow, than to have all of the waters of this great river, that belong to the lower-basin States, taken into one compact area, where only one of the lower-basin States will be materially helped. The great development contemplated under the legislation being considered by this committee will work out to the joint advantage and progress of the State of Arizona and the Federal Government, and Arizona, like every State in the Union, should be encouraged and assisted in developing and putting to use every natural resource within her boundaries.

The products of Arizona's agriculture are prolific and are of the finest quality. Citrus fruits, winter vegetables and cantaloupes are food items that come onto the market when most other States are still in the grip of winter and early spring. These products of Arizona's soil contribute greatly to the health and well-being of the American people. Many other products of Arizona's agriculture form the basis for a never-ending source of wealth to the State and Nation.

In conclusion, I respectfully urge that this legislation be enacted into law by the Congress of the United States. Justice and equity dictate that Arizona, as the youngest State of the Nation, should be given its opportunity to develop and grow and take its place beside the other great commonwealths of this Nation as a strong, vigorous member of the group.

Mr. MURDOCK. Thank you, Judge Udall.

Mr. UDALL. Thank you.

Mr. MURDOCK. Will you please hold yourself in readiness to answer questions later? We had stated that at this hour the subcommittee would adjourn and the full committee would meet. These committees are the same in personnel. I will turn the gavel over to the acting chairman, Mr. Peterson.

(Whereupon, at 9:45 a. m. the hearing was recessed until 11 a. m. of the same day.)

(The committee reconvened at 11 a. m.)

Mr. MURDOCK. The Subcommittee on Irrigation and Reclamation will reconvene and continue with the hearings on H. R. 934.

We had heard briefly three witnesses this morning. I would be glad to hear at least three more, asking that the members minimize their questions, or reserve them so that we can probably get them all together.

I am glad to note the presence with the committee now of my colleague from the Second Congressional District of Arizona, Congressman Patten. I am also glad to note that Senator McFarland is with us. Senator McFarland is a distinguished authority on water law. I think, however, the Senator ought not to appear again as a witness at this time because it would involve legal matters, Senator, which we want to reserve for a later date.

Senator MCFARLAND. Mr. Chairman, I had completed my statement except that briefly I want to put in the record that there are quite a number of witnesses, I know, who want to go home, and I will be available here if the committee should want to ask me any questions later on.

Mr. MURDOCK. I will pass that word along, Senator. I am glad to hear you say so, because I know there are a lot of questions that members want to ask you because of your intimate knowledge of all the circumstances. Some of these witnesses have come here by plane. One of these I called this morning, and he must have parachuted into the city of Washington after floating all over the map in the fog.

Is Mr. Jacobs present? Mr. Jacobs, will you come up and present your statement, please?

STATEMENT OF JOHN M. JACOBS, FARMER, PHOENIX, ARIZ.

Mr. JACOBS. My name is John M. Jacobs. I live in Phoenix, Ariz. I am a farmer.

Mr. MURDOCK. Several members of the committee have asked that the dirt farmers tell us their story.

Mr. JACOBS. I am principally engaged in the growing of perishable and semiperishable vegetables, but also in the livestock business, raising and feeding cattle for market. Associated with me in my operations are two sons-in-law and two brothers-in-law and one nephew who are engaged in the management of my business.

Mr. MURDOCK. Would you care to summarize your paper, Mr. Jacobs, instead of reading it entirely, and then inserting the paper as furnished us, in the record?

Mr. ENGLE. I observe that this man is a real dirt farmer. Is that correct?

Mr. JACOBS. That is correct.

Mr. MURDOCK. You are not a lawyer?

Mr. JACOBS. No, sir.

Mr. ENGLE. Thank you very much.

Mr. MURDOCK. Go ahead, Mr. Jacobs, and present the matter in your own way.

Mr. JACOBS. It would be rather hard for me to brief it, but I will read it as fast as I can, if that is agreeable.

I have farmed all my life, locating in the West after I was discharged from the Army in 1919. I have farmed in Arizona since 1934. My

first trip to central Arizona was in 1931. At that time I saw the possibility of growing and shipping mixed vegetables through the fall, winter, and spring months, when the same would be in demand in Northern, Midwestern, and Southern States. I realized also that due to the long growing season in Arizona, they were able to make two crops a year on most items. The early crops are planted mostly in August and September for harvesting starting in November and continuing through February. The late crops are planted as soon as the early crops are taken off and harvested mostly in March, April, and May. Early potatoes and melons are harvested through June and finished in July.

When I first started farming in Arizona, the principal vegetable production was lettuce and cantaloupes. Since that time the production of these two items has increased and a more diversified production has increased the total acreage planted to perishable crops. Now these crops produced in central Arizona include practically every item in the seed catalog, but mainly lettuce, melons, carrots, broccoli, celery, cabbage, cauliflower, brussel sprouts, spinach, beans, turnips, potatoes, and onions.

Central Arizona's total production last year, from approximately 100,000 acres in fruits and vegetables, shows a record of 37,908 cars, and brought a cash return to Arizona producers of approximately $50,000,000. Most of this production was from land of a fine quality loam soil that produces two crops annually. These figures are from the records of the Office of Standardization of Fruits and Vegetables for Arizona.

This production of fruits and vegetables last year resulted in a cash pay roll (production and harvesting) of from 18 to 20 million dollars' worth of crate material, paper, and other packing supplies. This production required the use of fertilizer costing approximately $1,250,000, imported from other States. It represents an investment of around $5,000,000 in farm equipment, trucks, and packing equipment, practically all of which is supplied by the major national implement and equipment manufacturing companies in the Midwest and East.

Figures from the quartermaster market center show that more than 2,000 cars of produce were purchased from this district for military use during the war. In viewing the records of the distribution from records of the United States Market Service, it is disclosed that approximately 50,000 cars annually moved to 300 markets in 45 States, mostly Eastern, Northern, and Midwestern, with some considerable shipments to Canada, Hawaiian Islands, Alaska, and other ports. These records show that this tonnage moved mainly from late November to late May, except for melons and potatoes, which moved through June and July. This indicates that this production is not competitive, but rather is needed during those months when the area receiving them is dormant or is producing little fresh fruits and vegetables.

The production of fruits and vegetables is a big business and is, no doubt, the most intensive type of farming. Due to the high cost of production, most growers have found it profitable to spend considerable time, effort, and money in heavy fertilization and the growing of cover crops in order to maintain a high state of fertility in the soil. Practically all of these fruits and vegetables require a lot of hand

labor in weeding, thinning, hoeing, and harvesting. With our present agricultural costs more than doubled in the last few years, our investment per acre is so high that we cannot afford to neglect any part of our operations, even though expensive.

We rely entirely on irrigation, and even a slight shortage in our water supply can cut our yield so low that the high labor and other production costs make it prohibitive to maintain our present acreage of these essential crops. All acreage is planted according to the amount of water available per acre and full production cannot be made on less than 4 acre-feet of water per acre per year on this land. We have developed to its fullest extent the available water supply for land now in cultivation in central Arizona, and we have only one place to look for supplemental water to maintain our present production, and that is to the Colorado River.

The vegetable industry, due to its intensive nature and the large amount of hand work necessary, employs more labor per acre than any other type of agriculture. A small vegetable farm will carry many employees and their families. During the housing shortage, scarcity of transportation and rationing of gasoline and tires, most of the vegetable growers had to provide housing on their farms for a large percent of their employees. A water shortage, cutting down the production of these crops, is bound to cause displacement of many families now established either as operators or employees on these farms.

This is really a serious situation for all farmers in this area, as all the gravity water has been fully developed and for several years we have been borrowing from the underground water supply by pumping from large capacity wells running day and night. Our water table is lowering at an alarming rate. If we do not get a supplemental supply, a considerable portion of the land now in cultivation will have to go back to the desert. Most of our growers have gone ahead, under the impression that Arizona had a substantial allotment of water coming from the Colorado River; that this water would be brought in and made available when needed; and again I repeat, this is our only source of a supplemental supply for our lands now under cultivation.

To make this problem more serious, we are now faced with a power shortage. Practically all of our water is pumped by electricity and these pumping operations have been seriously curtailed by this power shortage. The building of Bridge Canyon Dam will result in a further power development that will, to some extent, relieve this situation.

Another very important basic crop produced in central Arizona is sugar-beet seed. We do not produce the sugar beet for sugar but for seed only. We produce most of the seed for all of the western and midwestern beet-sugar-producing States, as well as support a lot to Europe. This subject is more fully covered in the detailed statement of Dean Stanley, one of the men who pioneered this industry. In his statement he emphasizes the importance of this industry to the national beet-sugar production of the entire United States.

Mr. CRAWFORD. Will the gentleman yield?

Mr. JACOBS. Yes, sir.

Mr. CRAWFORD. When the World War came on, this country was

caught without sugar beets. A portion of the Western Hemisphere had to supply all of the Allies with sugar by hook or by crook, and they did manage to get a few seeds in here. At that time we imported all of our sugar beet seed from Europe. That was all of it; every pound of it.

Since World War I, through your assistance down there in Arizona, we have now become the exporter of sugar beet seed to Europe.

Mr. JACOBS. That is correct.

Mr. CRAWFORD. Still, the whole allied world depends on the Western Hemisphere for sugar in wartime because immediately your sugar fields of western Europe are overrun when war starts, the sugar goes out of production. So, this development of the beet sugar seed in the Southwest is one of the biggest political headlines and one of the most essential things to the supplying of food for the allies of any single operation that has been carried on under the American flag.

Mr. JACOBS. Might I ask you a question? You are familiar with the production in Arizona that has developed there?

Mr. CRAWFORD. Yes, sir. I watched it from the first dream up to the present time.

Mr. JACOBS. The State of Arizona has an area of over 73,000,000 acres. It is the fifth largest State in the Union. There are 775,000 acres of irrigated land in the State, or slightly over 1 percent of the entire area. The balance of 72,000,000 acres is suitable only for grazing of livestock. Of this total, more than 80 percent is owned and administered by Federal agencies. Approximately 50 percent of this area has an average rainfall of less than 10 inches. The higher mountain areas have more rainfall than the lower desert area in which practically all the irrigation production lies. Central Arizona has an average annual rainfall of less than 8 inches.

The raising of livestock on the range is one of the most important industries of Arizona. During the period from 1920 to 1947, the number of cattle in the State declined from the figure 1,620,000 to 921,000. The number of sheep also declined. At the same time, the human population of the State increased from 340,000 to 700,000. In 1946 Arizona marketed approximately 410,000 head of cattle, the State consumption being approximately 235,000 head. Considerable of this surplus is sold to California markets. However, this year several hundred carloads have been shipped to midwestern and some eastern markets. Records of some cattle sold for slaughter show them shipped as far as Detroit and Baltimore, principally to Fort Worth and Kansas City, and other large midwestern markets.

A large part of these cattle raised on the range are fed and prepared for market on the farms in central Arizona and many cattle are shipped in each year from Texas, New Mexico, Colorado, Utah, and California for pen fattening. Some of these are slaughtered in Arizona, but most of them are shipped to other points for slaughter. Records of the Los Angeles Union Stockyards show that they received cattle from a total of 28 States, and Arizona furnished 20 percent of this total. It is estimated that the cattle production is approximately 35 percent of the State's cash agricultural income.

The sheep are grazed on the higher elevation during the summer months and brought to central Arizona in the fall for lambing and shearing. This vast livestock industry is dependent on the irrigated

lands of central Arizona as winter feeding grounds for both cattle and sheep. We there produce hay, grain, ensilage and cottonseed meal and are self-supporting on these feeds which are necessary to the finishing of these livestock for slaughter. We also export to California large quantities of alfalfa, hay, grain, and cottonseed meal, which is used mostly in their vast dairy industry. If this livestock industry is to continue and help to furnish food for the Nation, the farms of central Arizona must remain in cultivation and this can only be assured by the bringing in to central Arizona of Colorado River water.

In the farming operations which are carried on by my family, as I heretofore pointed out, we farm land immediately adjoining the Salt River project. We get our entire water supply from underground pumping. We have about one-half of of our acreage in alfalfa, grain and ensilage crops. We raise cattle and practically all the feed we raise is used in the fattening of cattle each winter, the young stock running on green pasture until sufficiently mature to go to the feed pens. We have a small herd of registered cattle from which we produce for range replacement registered bulls and heifers. In our combined operation we produce a diversified line of vegetables of all kinds and for our forage crops, alfalfa, barley, and other grain. We also produce certified seed for the leading seed companies in this area, pure seed being particularly important in the matter of grain seeds.

During the early part of the war, in fact, in 1942, the labor situation became very critical in all agricultural areas. We decided to try and work out some plan of bringing in Navajo Indians from northern Arizona to take care of our farm labor problem. We checked with the reservation officials and agreed that we would provide transportation from the ranch back to the reservation when we were finished. In our operation we need a lot of labor from November until early July. In the fall of 1942 we brought in approximately 150 Navajos. We used this labor in the harvesting of our winter vegetables. We furnished them with lumber and material to build houses, although material was scarce. In 2 weeks the Indians had built houses and were housed in about 35 homes. We piped in good water for their camp and put in showers and sanitary toilets for their use. They were not accustomed to these facilities, but finally learned to use some of them, particularly the showers.

Mr. MURDOCK. May I interrupt for just a moment? I do hope the chairman of the Indian Affairs Subcommittee, and all the members of the Indian Affairs Subcommittee, will pay careful attention to what is just being said, because you are touching on one of the big questions before the Congress now.

Mr. POULSON. Will the chairman yield?

Mr. MURDOCK. Yes, sir.

Mr. POULSON. Do you know whether the Indians of the State of Arizona vote?

Mr. MURDOCK. Yes, I do. There was a decision of the State Supreme Court and they voted last November 2.

Go right ahead, please.

Mr. JACOBS. Since 1942, each year we have increased the number of Navajos used in our farming operations and, of course, added to the housing facilities for this labor. In this matter we have cooperated with the Indian Service and we are very well satisfied with the work

performed by the Navajos. More than half of our production has been harvested by Navajo labor.

Our heaviest need for them is from November to March. Then we have a break in our harvesting operations through April, during which time the Indians return to their reservation, where they care for their flock, generally shearing during that period of time, and then come back to our farms to help us harvest in May, June and July. We then return the Indians to the reservation for the summer months. Some of these Indians work in the vegetable farms near Grants, N. Mex., during the months of August, September, and October, going back to the reservation for a short time to get their small farms and herds in shape, and then coming back to central Arizona for the fall crops.

This arrangement has worked out very satisfactorily now for 6 years. The Indians want to go back to the reservation some two or three times a year. We are close enough that we can make the trip to or from the reservation in 1 day. There are three other producers in the area who have adopted this same plan and together we are now using probably around 800 Navajos each year in this work. Our own pay roll this last year to Navajo Indians was approximately $100,000.

I have given considerable thought and study to the Navajo problem and believe they are a people who can satisfactorily supply the need for extra labor in central Arizona 8 or 9 months of the year. A part of this labor is now being supplied by Mexican nationals. This plan will relieve a congested situation which now exists on the reservaton and which, as you know, has become a serious problem of national importance. I am convinced that 4 or 5 thousand Indians could be used to good advantage in central Arizona in the agricultural field and that the Indians would profit greatly thereby.

The Indian readily adopts white man's conveniences and habits and the first year we had them, all they wanted was a board shack with a roof and dirt floor. Now many have floors in their cabins, stoves, individual cooking utensils, carpeting, linoleum, curtains, and have lined their cabins with paper. Their living conditions have been vastly improved. Schooling is a serious problem, but we are trying to work that out with the Indian officials and local school authorities.

Among these Indians we find considerable leadership. We have one Indian who is a general foreman who has done a fine job in the handling of his people. We have another Indian who is a camp boss and whose duty it is to see that the camp is kept clean and the liquor and other abuses are kept down to the minimum. We have one man working with the Indians whose duty it is to see that any sick Indians or anyone needing medical attention is taken to the hospital.

Incidentally, there is an Indian hospital in the Phoenix area to which we take any Indians who are sick.

The Indians are good traders and are reliable workers, as a rule.

We are planning further improvements for their benefit, particularly the building of a recreation hall which can be used for a church on Sunday. A surprisingly large percentage of them want to save money, and we have provided an arrangement through our office where this is made possible. We take care of their savings and hold them during the work season. When they return to the reservation, they take with them a considerable accumulation of money that has been held for them. Several of them bought automobiles and they always

stock up on household items of one kind or another which they take back to the reservation.

We pay the prevailing scale in the area for all work done by these Navajos. I am convinced that the Navajo will become an established portion of the perishable products labor pool in this area. It is the only large producing area close enough to the reservation so that the Indians can make the trip to or from the reservation in one day. This whole program, of course, again is dependent upon our having enough water to raise our crops. Without water we cannot raise crops, and if we do not raise crops, of course, we have no use for labor.

The bringing into central Arizona of Colorado River water to supplement the supply of irrigation water for the presently irrigated areas which are critically in need of this water will—

(*a*) preserve an existing agricultural development;

(*b*) stabilize the livestock industry of the State;

(*c*) prevent land now being irrigated from reverting to the desert; and

(*d*) go a long way in the next few years in helping to solve the national problem of the care of the Indian tribes which are a direct responsibility of our national Government. Passage of this bill is the key to the whole problem.

That is all, Mr. Chairman.

Mr. MURDOCK. Do not run away, Mr. Jacobs; we may want to ask you some questions a little later on.

I want to call this fact to the attention of Congressman D'Ewart of Montana, who has been interested in the problem of the Navajo, emphasizing the fact that such reservation employment is the key to the Navajo situation. I wonder if members of the Indian Affairs Subcommittee would like to ask some questions right there.

Mr. MORRIS. In deference to the other witnesses' time, I shall not ask any questions now in the matter. However, I am deeply interested, as I am sure every member of the Subcommittee on Indian Affairs is, in this particular subject that you mentioned regarding employment of the Navajos. We all realize the Navajo problem presents one of the grave problems confronting our Nation at this time. I listened carefully to what you said and I am going to reread your statement in that respect and give it most careful consideration.

Mr. MURDOCK. As a committee then, perhaps we had better follow the same line. Mr. Jacobs, would you hold yourself in readiness to answer some questions a little later when we have heard some other witnesses.

I will ask Judge Udall and the others to do the same thing.

Is Mr. Victor Corbell present? I am especially glad to present Mr. Corbell as he is my nearest farm neighbor.

Mr. Corbell, you may proceed after giving your name to the reporter.

STATEMENT OF VICTOR I. CORBELL, MEMBER, BOARD OF GOVERNORS OF THE SALT RIVER VALLEY WATER USERS' ASSOCIATION, TEMPE, ARIZ.

Mr. CORBELL. Mr. Chairman and members of the committee, my name is Victor I. Corbell. I am a member of the board of governors of the Salt River Valley Water Users' Association, and have been for

the past 14 years. I am 54 years of age and have resided in the Salt River Valley, in the vicinity of Tempe, Ariz., all of my life.

I have been engaged in farming continuously for the past 30 years, and have resided on the same place, which I own and operate, for the past 30 years. In addition to my farming operation, I also operated a cotton gin for a number of years.

At the present time my family and myself own and operate 400 acres of land. All of the land is in a high state of cultivation and receives its water supply from the Salt River Valley Water Users' Association, a Federal reclamation project; one of the oldest in the United States.

The Salt River Valley Water Users' Association was organized in February 1903 at the suggestion of the then Secretary of the Interior, 1 year after the passage of the National Reclamation Act. It is a quasi public corporation, having certain powers and functions not ordinarily possessed by private corporations, such as the levying of assessments upon the lands of the shareholders of the project.

The owners of the land within the boundaries of the project subscribed to the stock of the association at the rate of one share of stock for each acre of land. The total number of shares outstanding is approximately 242,000, representing 242,000 acres of land.

The stock of the association, and the rights thereunder, are appurtenant to the land. Any conveyance of the land automatically transfers the stock of the association to which it is appurtenant to the new owner, whether expressed in the grant or not. Only natural persons, who are owners of the land, are entitled to vote, and the amount of votes any one shareholder may cast is one vote for each acre of land owned, not to exceed 160 votes.

WORKS OF THE SALT RIVER VALLEY WATER USERS' ASSOCIATION

The project works of the Salt River Valley Water Users' Association, the title of which is in the United States, or the Salt River Project Agricultural Improvement and Power District, consists of six storage dams and reservoirs, two diversion dams, one flood-control dam, eight hydroelectric plants having a generating capacity of 81,710 kilovolt-amperes, one steam generating plant of a rated capacity of 28,000 kilovolt-amperes, two diesel units of the rated capacity of 12,500 kilovolt-amperes.

It also has under lease from the United States Government a mobile steam unit of a rated capacity of 10,000 kilovolt-amperes. Since that was written, that unit has been returned to the Navy, but there is under construction and will be ready for production on June 1, a new steam generating unit of 12,500 kilovolt-amperes.

By contract it also has the use of a 16,000 kilovolt-ampere steam generating plant of the Consolidated Inspiration Copper Co., and has a contract with the United States of America for 30,000 kilovolt-ampere of power from Parker Dam in the Colorado River.

The association also has approximately 2,000 miles of transmission lines and 1,500 miles of canals and laterals. The association, through its various plants, distributes electrical energy both at wholesale and retail, and the amount of such distribution is a little over one-half of all of the public utility power in the State of Arizona.

Its electric lines extend throughout the project and also extend

throughout central Arizona. To a large extent it serves power to the greater part of the area covered by the proposed central Arizona project.

COST OF THE SALT RIVER PROJECT

The present works of the Salt River project represent a total outlay of $50,000,000. Of that amount $16,716,000 was advanced by the Federal Government, and the balance was privately financed. The association still owes the Federal Government $6,821,000. It is not in default in any of its payments. In fact, it is paid up in advance to the Federal Government for 3 years. The total project debt remaining unpaid, including the amount owing the United States, is $20,700,000. These figures are as of December 31, 1948.

Mr. MURDOCK. I might say that I frequently call attention to our prize project, and I am glad to have your accurate figures because it may be that I exaggerated some, although I do not think I could exaggerate too much.

Mr. CORBELL. Thank you.

WATER SUPPLY OF THE SALT RIVER PROJECT

The sources of water supply of the Salt River project are from the Salt and Verde Rivers, upon which there are a total of six storage reservoirs with a combined capacity of approximately 2,000,000 acre-feet, and also from approximately 204 deep wells within the project. Daily records have been kept of the flow of the Salt and Verde Rivers since January 1, 1889. Based on those records it is estimated that the amount of stored and developed water that will be available in the future for the lands of the Salt River project will not exceed 3 acre-feet per annum.

This does not include certain lands which have decreed rights, which have an additional supply of a varying degree, depending upon the year of their priority. The majority of the lands within the project are without decreed water rights of any value, and for the purpose of this statement only the water supply for those lands without decreed rights is considered.

The records of the past 20 years, which can be considered as a fair average for the entire period for which records have been kept, disclose that on an average there has been delivered to the lands of the project 2.8 acre-feet of stored and developed water per acre per annum. Nineteen percent of that water has been pump water.

During a part of that time there was no storage on the Verde River. Had there been full storage on the Verde River during all of the 20-year period, it would have increased the average amount of water available to each acre of land to approximately 3.1 acre-feet per acre per annum.

All of the water capable of being developed, both from the streams and the underground, for the Salt River project, except for some insignificant amounts on the Verde River, has already been developed. Any additional supply, therefore, has to come from the Colorado River. Three acre-feet per acre per annum is an insufficient amount of water for full production.

AVAILABILITY OF WATER SUPPLY

The history of the project has been that the amount of water available in any given year may range from a full supply down to 2 acre-feet per acre per annum, such as has been the case in the years 1947 and 1948. In only 2 years in the last 25 has a full supply been available. The inescapable conclusion is that there is more land within the project than that for which there is an adequate supply of water.

AMOUNT OF WATER NECESSARY TO GIVE LANDS OF THE ASSOCIATION ADEQUATE SUPPLY

The per acre use of water in the Salt River Valley project has increased over the past 25 years. This has been due, in part, to a change in the type of crops grown and in part on account of more intensive cultivation.

In the early days of the project about the only type of crops grown was grain and alfalfa. It is only in recent years that vegetables have been grown. Vegetables are now one of the principal crops. Acreage in citrus has greatly increased. Double crop raising is now the common practice. The land is too valuable to permit the same to lie idle.

All of this means an increased use and need for water. The amount of water necessary to give the lands of the association a fairly adequate supply is approximately 4 acre-feet per acre per year delivered at the land. This is equal to one-third more than the present average supply. Four acre-feet per acre per year is what I figure to be the average amount necessary. Some crops use less. The majority of the crops use that much or more.

MEASUREMENT OF WATER

The association, for years, and at the present time, measures the water at the source and at the delivery points. It is measured at Granite Reef Dam at the head of the canal system and at the pumps where it passes into the canal and lateral system. The total of those two measurements is the gross supply. It is also measured where it is turned into the private ditches of the landowners. The amount delivered to the landowners is approximately two-thirds of the gross supply. The rest is represented by evaporation, canal, and lateral losses, and to some extent in overdeliveries.

To supply the association with 242,000 acre-feet of additional water at the land would require approximately 363,000 acre-feet at Granite Reef Dam, or approximately 400,000 acre-feet where the same is diverted from the Colorado River, if additional water is obtained from that source.

SALT BALANCE

All western streams contain dissolved solids and salts. Irrigation, evaporation and plant growth absorb very little of the harmful salt, and the remaining water that flows into the underground contains a very large proportion of salt. Unless a sufficient quantity is allowed to drain from the project by what is generally referred to as return flow, the underground water will, in time, become unfit for bene-

ficial use for irrigation purposes. Some small parts of the Salt River project already have that character of underground flow. Overdevelopment of the underground water to the extent that there is no longer an outflow, will cause such waters to become in time unfit for beneficial use.

Extensive pumping in the Salt River Valley has, in some places, caused the underground water to reverse its flow and there are now in some sections no outflow waters draining into either the Salt or Gila Rivers.

In order to maintain the salt balance in the underground water it is necessary that additional quantities of water be allowed to go into the underground supply so that the outflow water will carry from the project substantially the same amount of salt each year as that entering the project. This can be only accomplished in one of two manners.

First, to greatly curtail pumping and allow the underground water to rise. Second, to bring additional quantities of gravity water into the area. To greatly curtail pumping means the abandonment of large tracts of land, which leaves the second alternative, namely, bringing additional water into the area, as the only practical solution.

CHARACTER AND VALUE OF THE CROPS AND INDUSTRIES IN THE SALT RIVER PROJECT

The gross value of crops grown in the Salt River project for the year 1948 was $33,080,000, or $147.26 per acre. In some ways it can be considered as more than that, for the crop report does not take into consideration the profit made by dairymen or in the feeding of livestock, only the value of the feed is considered.

Not enough wheat is grown to supply the local demand. Barley and alfalfa are grown for feed only. Insufficient butter and eggs are produced to supply the local markets. Attached to this statement is the crop report of the Salt River project for the year 1948, which shows in detail the various crops grown on the project. Not all of the crops grown are listed on the crop report, as many are classified in groups.

There is a direct relation between the value of the crops grown and the amount of water available. Land of itself has little or no value in the State of Arizona in the Central Valley. It is only the application of water that brings about any value to the land, and the amount that you can grow is not dependent upon the number of acres, but upon the number of acre-feet of water that you have available.

CENTRAL ARIZONA PROJECT

The Salt River Valley project lies in the approximate center of the Central Valley in Arizona. In the Central Valley there is something over 700,000 acres of land in cultivation. Roughly one-third of it comprises the Salt River project. The balance includes such projects as the Roosevelt irrigation district, Roosevelt water-conservation district, Maricopa County municipal water district No. 1, Buckeye irrigation district, Arlington irrigation district, Gillespie land and irrigation district, San Carlos project, the Safford Valley, and a large amount of land that is served with pump water extending from the neighborhood

of Eloy, Ariz., in a northwesterly direction through the Casa Grande Valley and the Salt River Valley to a point some 25 miles northwest of Phoenix. Roughly, that is the land embraced in the proposed central Arizona project.

All of the land in question is, practically without exception, extremely fertile, and has for the past several years been producing bountiful crops. Cities, towns, schools, roads, and other things that go with agricultural economy have been built within the area based upon the production of the land in question.

It is safe to say that the population in the area involved is in the neighborhood of 400,000 people. The amount of water being pumped in the area to serve these lands, independent of the gravity supply, probably exceeds 2,000,000 acre-feet per annum. The recharge of this underground water probably does not exceed 750,000 acre-feet per annum. The result has been a progressive lowering of the underground water plane. Sooner or later a considerable part of the land must go out of cultivation unless a supplemental supply of water is obtained to replenish the underground supply and at the same time furnish a supplemental supply to those land receiving gravity water.

IN GENERAL

All the agricultural land throughout central Arizona is highly productive wherever water is available, and there is no reason why, with an adequate supply of water, all of the land in the entire area would not be able to produce crops having an acre value as great as that of the Salt River project. The crops that are grown on the land are only a small part of the productive wealth of the area. Official records disclose that during the year 1947, 51,967 cars of fruit, vegetables, and melons were shipped from Arizona, by far the greater part of which came from the Salt River Valley and the adjacent area embraced within the Central Valley project.

The amount of freight paid to the railroads for shipping those fruits and vegetables was approximately $20,000,000. The picking and packing costs involved an expenditure of nearly as much. The amount of money spent in growing the crops would be a like amount.

Thousands of carloads of lumber are necessary to make crates in which the fruits and vegetables are shipped. Thousands upon thousands of tons of ice are manufactured to cool the cars in transit.

You have an expenditure, in a single year in the fruit and vegetable industry in Arizona, in the growing, harvesting, packing, and shipping of same, of an amount that is 50 percent in excess of the total cost of the works of the Salt River project.

I have only pointed out one of the industries, but you will find the same thing going on in other agricultural lines, though probably on a lesser scale.

You cannot always look at an irrigation project on the basis of whether the land values will be equal to or greater than the costs of the work of the project after it is built. The wealth incident to such a project is many times the value of the land within the project.

The millions of dollars' worth of products which are shipped from central Arizona each year are practically all noncompetitive with crops grown in other parts of the United States. The money received from those crops is largely spent in the Middle West and the East.

I had occasion the other day to examine the personal property in our home and on our farm. All of the machinery and fencing were produced and manufactured in the East and Middle West. All of the furniture had been manufactured in the States east of the Mississippi River. All the clothing, bedding, linens, and the like had on them the stamp of an eastern manufacturer. The automobiles came from Detroit. Even the food had an eastern and middle-western origin. The hams came from Chicago, the flour from Minneapolis. About the only things in the cupboard and refrigerator that I could find that were grown or raised in the State of Arizona were the fruit, fresh meats, and vegetables.

Unless a supplemental water supply is brought into the area, a large part of the land must go out of cultivation. Whenever that happens, the allied industries of necessity will have to wither and die. People in such communities try to hang on. They are unable to pay their taxes or to support the community. In fact, the community has to support them.

It means the raising of taxes, the closing of schools, empty stores and houses, and everything else that goes with a decadent condition. The only things that increase under such conditions are poverty and crime. If that happens, which must happen—namely, to permit a large part of the cultivated area to revert to desert in central Arizona—the loss to the United States Government each year in taxes would, in my opinion, be more than sufficient to service the debt on the cost of the central Arizona project.

This country of ours is growing. We have to find places for the people to live. The average holdings in our project are relative small. The number of ownerships in our project has increased from approximately 4,000 at the time of its organization in 1902 to over 14,000 at the present time, with no increase in the number of acres.

The gross value of the returns from the land has increased even more than that in that period, and I look for further increases in the future, and it is my honest and sincere belief that this project should be authorized.

If anyone had told me as a young man that today approximately $50,000,000 would be invested in works of the Salt River project, I would not have believed it. The original Government expenditure on this project was approximately $10,000,000, and many farmers at that time thought it was more than the land could afford to pay. The other $40,000,000 were spent in works built later, that were never thought of when the project was originally conceived. Only one storage dam was originally contemplated and now there are six; and the power system of the association has been extended beyond the anticipation of anyone at the time the project was originally built.

The cost of the central Arizona project is too great for any one man or group of men to undertake privately. That was true of the Salt River project when they commenced building it over 40 years ago. But, if you will take the long-range picture for the years that the Salt River project has been in existence, there are many more reasons, as of today, why the central Arizona project should be built than there were reasons in 1903 for commencing to build the Salt River project.

We hope the members of this committee will see their way clear to recommend the passage of the act to Congress, and that if any of them

have any doubt in their minds as to the wisdom of the bill, that they come out to Arizona and pay the Salt River Valley a visit, and the Salt River Valley Water Users' Association will be only too glad to be their host.

Mr. MURDOCK. Thank you, neighbor, for that splendid presentation. We have only a few minutes left. If Judge Udall and the other witnesses would come forward, too, perhaps we could ask a few questions. While they are coming around I would be glad to have you stress the fact that we do not, as a mining State, produce all of our own food, so it is necessary that we keep on growing competitive crops. Before Judge Udall is seated, I wish he would point out on the map the agricultural area for which he speaks, that is, the Safford area.

Mr. UDALL. Perhaps it would be better on this map, because I notice it also shows New Mexico. While I am not officially representing New Mexico, I did refer to it in the paper I submitted.

The Safford Valley is just over the line of New Mexico and there is around the Duncan and Franklin area about 8,000 acres of land. There is 32,000 acres of land in the Safford Valley in this area [indicating on map]. Then the other areas are represented down here in the green part.

Mr. MURDOCK. What is the altitude of the Safford area as compared with the central part of Arizona?

Mr. UDALL. The Safford area is 2,900 feet.

Mr. MURDOCK. Will you make it clear to us how you will benefit from water that is brought to a lesser altitude?

Mr. UDALL. If water is brought from the Colorado River over into the Salt River Basin and put into the Salt River—Granite Reef Dam, then another works will provide for a tunnel from one of the dams on the Salt River, I believe, to Stewart Mountain, and it will go through the mountain here and put it into the Gila River above Florence. Then in turn the people in Safford Valley and Duncan Valley would be permitted to retain a larger portion of the water of the Gila River to compensate for Colorado River waters received in the central area.

Mr. MURDOCK. Their water then will be exchange water rather than the literal or actual supply from the west?

Mr. UDALL. Yes, sir. That is correct.

Mr. MURDOCK. Mr. Engle has a question.

Mr. ENGLE. I wanted to ask you, Mr. Corbell, a question about the Salt River Valley project. What do you pay per acre-foot for water now, Mr. Corbell?

Mr. CORBELL. We reach an assessment the beginning of the year. This past year it was an assessment of $10 per acre, which carried two acre-feet of water with it, and excess water, if there is any, is $3.50 an acre-foot.

Mr. ENGLE. Can you afford to add on to that the water supplied under this project at $4.50 per acre-foot?

Mr. CORBELL. I think it has been upped to $4.75. Yes, sir.

Mr. ENGLE. In other words, your total per acre cost for water would get up around $14.50 or $15?

Mr. CORBELL. You mean, per acre for 3 acre-feet?

Mr. ENGLE. Yes.

Mr. CORBELL. It would be a little less than $15. It would be $13.50. If you add your fourth acre-foot, we could well afford to pay the $4.75 for that.

Mr. ENGLE. You say that, based upon present agricultural prices?

Mr. CORBELL. Of course, when agricultural costs and other costs come down, your original 3 acre-feet would be much less and you could well afford, to supplement your supply, to pay an additional amount for 1 acre-foot.

Mr. ENGLE. I observe that you have 242,000 acres and your investment was $50,000,000, which would be approximately a little over $200 an acre. You have a capital investment of $50,000,000 and you have an outstanding bonded indebtedness against that of $20,000,000. Is that right?

Mr. CORBELL. The total investment is $50,000,000, including the bonded indebtedness.

Mr. ENGLE. That is what I understood. Yes.

Mr. CORBELL. Perhaps I did not understand that.

Mr. ENGLE. I have before me the letter of February 4, 1949, written by the Bureau of the Budget to the Secretary of the Interior, and on page 4 it states as follows:

> The State of Nevada, in commenting on the economic justification of the project, computes the net irrigation contribution of costs on the acreage which will be salvaged by the project at $1,469 per acre. Consider the justification of such cost in the face of an estimated farm-land value, with irrigation, of $300 per acre.

Do you have any comment to make on that?

Mr. CORBELL. I suppose you are referring now to the total project that is involved in bringing this water in. I am not going into that. I merely state as a farmer that we can well afford to pay $4.75 for an additional acre-foot of water to be added to the allotment in the Salt River project.

Mr. ENGLE. Do you think there is real economic justification though in spending $1,469 per acre in capital investment when, according to your figures, with what you are getting now, you have only spent $200 in capital investment? The point I am making is that for $200 per acre capital investment you are getting water on that land with an average supply now of 3 acre-feet per acre.

The question I am raising is whether or not it is good business to put in $1,469 per acre in capital investment additional, into that kind of a proposition.

Mr. CORBELL. Congressman, I am not an engineer, but I have just been informed to the effect that this $14 includes the total expenditure for the construction of all the works which would go into the construction of this central project.

Mr. ENGLE. It is the net irrigation construction cost.

Mr. CORBELL. What is the gross amount of that irrigation construction cost?

Mr. ENGLE. The State of Nevada figured it up as recited in this letter of the Bureau of the Budget as $1,469 per acre. I am not saying that is correct. It may not be.

Mr. CORBELL. I do not know whether it is or not.

Mr. ENGLE. I have no right to dispute it, but assuming for the purposes of this question that is correct, and if it is correct does it

make any sense to put $1,469 per acre of capital investment into land which, when irrigated, is worth $300 per acre?

Mr. CORBELL. Of course, you have a lot to take into consideration as to just what are the benefits going to be received from that amount of money. If it is just total acreage of the farm we are talking about, that is something else, but if you are talking about power production and talking about salvaging the agricultural economy here, then I think in time it will be wisely spent. I don't know. The engineers of the Reclamation Bureau and other engineers tell me this is a feasible project and the water will cost the farmer $4.75, delivered to his farm. As a farmer I would be very happy to pay $4.75 for an additional acre-foot of water.

Mr. ENGLE. Here is what the engineers say about it, reading from the same letter of February 4, 1949 of the Bureau of the Budget, and I am quoting from page 1:

> It is the opinion of the Regional Director of the Bureau of Reclamation that the project has engineering feasibility in the sense that there are no physical obstacles which could not be overcome. He states, however, that financial feasibility of the project is more difficult to determine. Further, in his report to the Commissioner of Reclamation, he raises the question as to the adequacy of the water supply of this project. It is pointed out in the report that the project as proposed is economically infeasible under the existing reclamation law and it is, he says, a rescue project, designed to eliminate the threat of a serious disruption of the area's economy.
>
> Modification of these laws are, therefore, proposed in the report to extend the repayment period for the entire project, including power, to 78 years and use one-fifth of the interest in commercial power investment to aid in the repayment of the irrigation features.

Mr. CORBELL. I am not an engineer and I do not think I can discuss that with you but I think you have witnesses following me who will be very happy to take it up with you.

Mr. MURDOCK. But one element which you are qualified to answer is this: If the water charge is $4.75 an acre-foot, that is a reasonable figure?

Mr. CORBELL. That is a reasonable figure. More so, probably, in our situation—with the Salt River project—because it is a supplemental supply. The over-all cost is not excessive for water, even with that included.

Mr. MURDOCK. What was the average production per acre, Mr. Corbell?

Mr. CORBELL. $147 an acre.

Mr. MURDOCK. $147?

Mr. CORBELL. Yes, sir.

Mr. MURDOCK. You are talking, Mr. Corbell, to men, some of whom are from the Midwest and the East. They cannot quite understand how an acre can have or can support a $15, or $16, or $18 per acre cost for water alone. You have to regard that, do you not, in relationship to the average cash production?

Mr. CORBELL. Yes. We have a long growing season there and our land is very productive and we have high yields. Accompanying this statement is the crop report for 1948, which I think would be very interesting.

Mr. ENGLE. As I recall, that figure per acre is a 1948 figure, is it not?

Mr. CORBELL. I think that it is 1947.

Mr. ENGLE. No, it is on page 8 of your statement. Your statement refers to the 1948 figures. I have great doubts as to whether the agricultural production is going to bring those high prices.

Mr. CORBELL. I think I would agree with you there, in the future, but as I said before, our other costs will keep pace with this. If our costs come down then our cost of water comes down. Those things are all taken care of.

Mr. ENGLE. How do you get your costs down? You mean that you have to pay less for labor and things like that?

Mr. CORBELL. That's right.

Mr. ENGLE. Your capital invested——

Mr. CORBELL. That remains the same. Of course, we carried that same capital investment back in the other period, and that has not increased. The increased cost here has been on account of increased labor and materials.

Mr. ENGLE. That is all, Mr. Chairman.

Mr. MURDOCK. The hour of 12 has arrived and we must adjourn soon.

Mr. POULSON. I would like to ask a question, Mr. Chairman.

Mr. MURDOCK. Mr. Poulson.

Mr. POULSON. It is my understanding that you will have tomorrow a continuance of these witnesses who will testify as to the need. In other words, it will be more of the chamber of commerce type of statements that are along the lines of that phase of it, and not the experts who will testify on the engineering qualifications and feasibility and the costs, and things like that. Is that right?

Mr. MURDOCK. You are about right. But you have not determined on the proper definition of an expert. I have heard an expert defined as "an ignorant man a long way from home." While Mr. Corbell is a long way from home, he is really well informed and an expert in regard to everything agricultural, in getting things out of the soil.

Mr. POULSON. But he is still testifying on the need, and we are not going into the phase of trying to establish the availability of the water and the engineering aspect, and the feasibility, and those things. Those experts, if you are going to classify them as such, will not be heard tomorrow. Is that right?

Mr. MURDOCK. You are right.

Mr. POULSON. All right. I will not be here. I just wanted to know that.

Mr. MURDOCK. Now I would like to say that I have listed here Mr. K. K. Henness, county agricultural agent of Pinal County and Mr. Walter Bimson, president of the Valley National Bank, and others of that type of witness. I am sorry, gentlemen, that we do not have quite the time necessary to put some further questions to you this morning.

Mr. LEMKE. I would like to make an observation, or put a question. Mr. Chairman, I am not concerned any further about the need. I was convinced of that last year. I was fully convinced also that the engineers know how to build this dam without my help. I am still interested to know that if we build this dam you will go and get the water, and that you are entitled to it. I have not heard about that. I would be interested to know when that comes up. I cannot sit here and listen to the same old thing over and over and over again.

Next, if you are not sure you are going to have the water, then I want you to satisfy me that California needs it stored as well as you do, and that it ought to be stored, no matter who gets it.

If you do that, I can see my way clear. If you do not, then I cannot. I think I would like to hear those things discussed. I understand this reservoir is needed for California as well as you, and it does not make any difference who gets it, but let us get it and get hydroelectric power. That is one phase of it. On the other hand I would like to see that you could get the water, and I would like you to get it, but I want to see that you are entitled to it.

Mr. MURDOCK. That is a correct observation, Mr. Lemke and we are glad to have it. It was agreed we would vary from our usual custom in the Public Lands Committee of not holding hearings on Saturday and hold a session tomorrow. So, unless there is an objection from those present we will adjourn now until 10 o'clock Saturday morning.

Thank you, gentlemen, for your presentations.

(Whereupon, at 12:05 p. m., the committee adjourned.)

THE CENTRAL ARIZONA PROJECT

SATURDAY, APRIL 2, 1949

HOUSE OF REPRESENTATIVES,
SUBCOMMITTEE ON IRRIGATION AND RECLAMATION
OF THE COMMITTEE ON PUBLIC LANDS,
Washington, D. C.

The subcommittee met, pursuant to adjournment, at 10 a. m. in the committee room of the House Committee on Public Lands, New House Office Building, the Honorable John R. Murdock (chairman of the subcommittee) presiding.

Mr. MURDOCK. The subcommittee will come to order.

We are continuing hearings on H. R. 934 and H. R. 935.

Mr. Engle would like to ask some questions of one of the former witnesses. Is Mr. Corbell here?

Mr. Corbell, will you take the stand once more. Mr. Engle has some questions.

STATEMENT OF VICTOR I. CORBELL, MEMBER, BOARD OF GOVERNORS, THE SALT RIVER VALLEY WATER USERS' ASSOCIATION, TEMPE, ARIZ.—Resumed

Mr. ENGLE. Just one or two questions, Mr. Chairman.

Mr. Corbell, I was very much interested in the statement you filed yesterday. Am I correct in the assumption that this project, the Salt River Valley water users' project, is one of the best in Arizona?

Mr. CORBELL. Well, that is what I have heard it called. I think we think so.

Mr. ENGLE. It is pretty well understood to be one of the outstanding water associations and water districts in the State, is it not?

Mr. CORBELL. That is what I have heard.

Mr. ENGLE. I have been interested in some of the acreage ownerships in Arizona. Do you folks anticipate the application of the 160-acre limitation to any supplemental water you get?

Mr. CORBELL. The violation of the 160-acre law within the Salt River Valley water users' project is violated only in a few instances. I think that acreage today is practically nothing as far as violating the 160-acre law is concerned. There are just a few people there who own more than 160 acres.

Mr. ENGLE. From your knowledge of the situation, State-wide, can you apply supplemental water without breaking up a good many farm ownerships?

Mr. CORBELL. That question has never been raised. However, the association is working to stop the 160 law from being offended against.

Mr. ENGLE. Some of our people are trying to stop it, also.

Mr. CORBELL. I do not mean we are trying to stop the 160-acre law. The association there is trying to stop people from offending that law, to keep them from owning over 160 acres of land. As I stated, no one is allowed to vote over 160 acres in any election.

Mr. ENGLE. Where is the San Carlos project?

Mr. CORBELL. The San Carlos project is on the Gila River which lies to the south and a little east of our project.

Mr. ENGLE. As I understand this project there is an exchange of water involved, is there not?

Mr. CORBELL. That is right, sir.

Mr. ENGLE. That is, the project is set up on the basis that the Salt River Valley Water Users' Association will effect an exchange of their water for Colorado River water, is that correct?

Mr. CORBELL. I think the law is so written that the Salt River has to consent.

Mr. ENGLE. Has your association consented to that exchange?

Mr. CORBELL. They have not, but I think it can be easily worked out where you do not have to have that exchange if they do not agree to it.

Mr. ENGLE. As a matter of fact, I understand they passed a resolution against the exchange.

Mr. CORBELL. That is correct.

Mr. ENGLE. Has that resolution been rescinded?

Mr. CORBELL. No, sir.

Mr. ENGLE. Then as far as your area is concerned the project will have to be modified to that particular extent, will it not?

Mr. CORBELL. I think that will be a question, after the project is once authorized, between the landowners within the project. That is not a serious problem, however. You can see by the map here, of course, that it merely means another lift. That is not very expensive, because when it comes by an all-gravity route you take the power production away from the Stewart Mountain Dam.

Mr. ENGLE. In other words, that is an internal problem in Arizona which will have to be settled by the respective water users?

Mr. CORBELL. That is an internal problem.

Mr. ENGLE. Not affecting the engineering feasibility, at least?

Mr. CORBELL. That is correct. That is a minor detail, I would say.

Mr. ENGLE. When was the last time your water users' association was refinanced?

Mr. CORBELL. We have been refinancing bonds all along. What do you mean by refinanced?

Mr. ENGLE. I mean where your finances were rearranged with the RFC, for instance.

Mr. CORBELL. Do you mean when we went through the wringer?

Mr. ENGLE. Yes.

Mr. CORBELL. No; we never went through the wringer.

Mr. ENGLE. But you have had some financial difficulty there, have you not?

Mr. CORBELL. I would not say we have had any financial difficulty.

Mr. ENGLE. Was there not some dealing in the financial district in 1935 through the RFC?

Mr. CORBELL. We attempted to do that, but they told us we were in too good a financial position to partake of that.

Mr. ENGLE. What did you try to do at that time?

Mr. CORBELL. Tried to do just like all the rest of these people, to buy our bonds in at a much-reduced rate, which we could not do.

Mr. ENGLE. Did you request a loan for that purpose?

Mr. CORBELL. We requested it, but it was denied on account of that.

Mr. ENGLE. I understand the RFC put the appraised value on your land at that time as $150 per acre; is that right?

Mr. CORBELL. I could not answer that, sir. I do not know.

Mr. ENGLE. What do you consider the appraised value of this acreage?

Mr. CORBELL. Today?

Mr. ENGLE. Yes.

Mr. CORBELL. I do not think you could buy any land in the Sale River project—good land, and most of it is of that character—for less than $400 an acre.

Mr. ENGLE. The purpose of this transaction, as I understand it, with the RFC in 1935 was not because you were a distressed district?

Mr. CORBELL. That is right.

Mr. ENGLE. It was because you wanted to buy our your bonds at an advantageous rate, shall we say?

Mr. CORBELL. That is right, sir.

Mr. ENGLE. The RFC refused you a loan for that purpose?

Mr. CORBELL. Because we could not refinance it as low as they required. We could not possibly buy our bonds back anywhere near the price that the RFC requested before we could come under that particular piece of legislation.

Mr. ENGLE. If farm prices should go back to what they were in the early or middle 1930's, would you have trouble carrying your present bonded indebtedness and your maintenance and operation cost?

Mr. CORBELL. You are speaking now, I suppose, of the very lowest time in 1933 and 1934 and in there?

Mr. ENGLE. Approximately that time; yes.

Mr. CORBELL. Well, it would be a little difficult. However, during that time we never defaulted on principal or interest.

Mr. ENGLE. That is all. Thank you very much.

Mr. WELCH. Are your bonds term or call bonds?

Mr. CORBELL. We have both kinds, sir. We have call bonds and we have term bonds.

Mr. MURDOCK. Before you leave, Mr. Corbell, may I ask how current is the association with its obligations to the Government?

Mr. CORBELL. Well, our obligation to the Government has been paid up, I think, to the year 1951. In advance.

Mr. MURDOCK. In other words, you are several years ahead?

Mr. CORBELL. Yes, sir.

Mr. MURDOCK. You are not only current but you are ahead?

Mr. CORBELL. That is right.

Mr. MURDOCK. Does the association get any interest from Uncle Sam on the money paid in advance of the due date?

Mr. CORBELL. Yes, sir. We received a discount, I think, of 4 percent, by paying in advance.

Mr. MURDOCK. The association is not only solvent, but it is in a good financial condition, you would say?

Mr. CORBELL. Yes, sir.

Mr. MURDOCK. Thank you very kindly, Mr. Corbell.

Mr. CORBELL. All right, sir.

Mr. MURDOCK. Mr. Corbell, I would like to ask you another question or two.

In regard to the acreage over the limit, you were not quite sure as to the percentage, you might say, which was over the 160-acre limitation. I have had occasion to make some inquiry about that, and I find that it is almost negligible.

Mr. CORBELL. That is right. I do not think it will run over 1 or 2 percent.

Mr. MURDOCK. I think that was about the information which I received from another source, so I think that must be correct.

Mr. CORBELL. In the water accounts in the association there are 242,000 acres, and some 14,000 owners, which makes an average of about 18 acres to a farm.

Mr. MURDOCK. We have been speaking of that as a violation of law. Is that a necessary or unavoidable violation?

Mr. CORBELL. It is not a necessary violation; no.

Mr. MURDOCK. At least, we have been trying to live up to the 160-acre limitation, have we not, right along?

Mr. CORBELL. That is correct.

Mr. MURDOCK. I had a relative who went into our valley in an early day, and who received a lot of land, but he disposed of his land so that he came within the limitation. I know that from personal knowledge.

What is the average ownership of land in the Salt River Valley Association?

Mr. CORBELL. It will run around 18 acres to the farm.

Mr. MURDOCK. I wish the committee would take careful note of that fact: An average of 18 acres. That sounds a little strange, of course, to easterners who are thinking of the 160-acre unit as written into the reclamation law.

How do you account for the fact that the average is so low?

Mr. CORBELL. Well, there are many, many subdivisions, where they have small citrus tracts and some farms like poultry farms where they make a living, and probably have a job doing something else during a portion of the year.

Mr. MURDOCK. Another thing I wish the committee would take pretty careful note of is that only just recently I had an inquiry from a man in New Jersey who wanted to go out to Phoenix and establish a poultry farm, as he said. I gave him all the information I could. That is only one which comes to mind right now. I have many such inquiries.

You find quite a development of that kind there in that valley, do you not?

Mr. CORBELL. Yes. The valley is very highly developed. That is, the Salt River project, this 240,000 acres which we are speaking of, is highly developed.

Mr. ENGLE. When you speak of the percentage, do you speak of the percentage of users or the percentage of the area?

Mr. CORBELL. Do you mean in acreage, in this violation of the 160-acre law?

Mr. ENGLE. No.

Mr. CORBELL. I am speaking of the area.

Mr. ENGLE. You spoke of such a small percentage of the number of users who were over the 160-acre limitation, and I take it you are talking about the number of users as distinguished from the acreage. What percentage of your acreage is involved?

Mr. CORBELL. I was using the figure on the acreage. I think you could count the number of people in violation of the 160-acre law in the Salt River project on the fingers of your hand.

Mr. MURDOCK. For the record, I want to make myself clear. I believe in the 160-acre limitation. I think it was a wise provision of the law of 1902 and I am in favor of keeping it, possibly with some modifications under extreme circumstances.

As I understand it, Mr. Corbell—and I received my information from another source and not from an official of the association—it is unavoidable in certain cases, without working undue hardship. Is it not true that in case of inheritances and that sort of transfer that there are transfers made, and you could not strictly enforce that law 100 percent?

Mr. CORBELL. Of course, he has a reasonable time to dispose of that property. Every effort is being made for that purpose, to get it cleared up.

Mr. MURDOCK. Thank you kindly for your appearance.

Mr. CORBELL. Thank you, sir.

Mr. MURDOCK. We have with us this morning an agricultural agent from one of the counties most interested in this development. Mr. Henness, will you take the stand, please.

STATEMENT OF K. K. HENNESS, COUNTY AGRICULTURAL AGENT, CASA GRANDE, PINAL COUNTY, ARIZ.

Mr. HENNESS. Congressman Murdock, without many of the committee present, will it be all right to move this easel up here?

Mr. MURDOCK. Yes, sir.

Mr. HENNESS. My name is K. K. Henness, county agricultural agent, with the University of Arizona. I have been county agricultural agent in Pinal County for 21 years. I grew up on an irrigated farm near Tempe, Maricopa County, Ariz., and have owned and lived on a farm near Casa Grande since 1936.

I am here to testify regarding water supplies for our lands and to give my estimate as to the future of farming in our county.

Many of you are familiar with irrigation in the West. You know that level desert land suited for agriculture means nothing without water. Water is the measuring stick of our production. Under our high temperatures and long growing season we need at least 4 acre-feet of water per year. Our entire farming and business economy is based upon the amount of water we have, either from gravity or river sources, or from underground storage which may be pumped.

The ideal situation in irrigated farming is to have a water supply which over the years is sufficient to annually provide the amount of water required for maximum crop growth. In the Southwest, where waters and soils carry salts, the supply must be sufficient to permit heavy irrigation to drive salt concentrations down. No irrigated agriculture is permanent without sufficient water to prevent harmful accumulations of alkali salts.

If a water supply is such that this amount can be delivered, let us say, for 3 years, and then perhaps only one-third of the required amount can be provided in the next 3 years, you have an unstable agriculture. You have an agriculture in which farmers are unable to plan and rotate their crops and diversify and build up their soils with legumes and do all those things that people in our work encourage in every county in America. This is the picture in the San Carlos project, which represents 100,000 acres of the irrigated land in our county, one-half white-owned, and one-half Indian-owned. I will talk about this project first, and later develop the situation that exists on the pump lands of our county.

I may well say here that in this year of unusually heavy storms in the West that run-off has been such that our project officials have alloted two acre-feet per acre; about one-half our requirements. Additional storms or flow from melting snows may for the first year since 1942 provide enough water for the irrigation of all lands in our project. We had hoped that with these great storms our reservoir might catch enough water for perhaps 3 years' supply, but it has not done so. Next year may very well be one when we have only one-fourth enough water.

In June of 1947 I had occasion to make a rather detailed investigation into our water situation. In the course of this, a number of photographs were taken which I think will illustrate the situation our farmers were in at that time. Let me say that in 1948 the situation was about the same, perhaps more aggravated. These photographs show vividly what a water shortage means in a land of desert with a year-long growing season and the high evaporation that accompanies our summer temperatures.

My first photograph is of the Frank Williams farm, near Casa Grande. It shows Mr. Williams' irrigation ditch, and part of a 40-acre field of land designated for water under the San Carlos project. Each acre of this land is capable of producing, with ample water, at least five tons of alfalfa hay in a season, plus winter pasture, or 300 pounds of beef if grazed, or a bale to a bale and a half of cotton. The growth that you see isn't a crop; it is rayless goldenrod, a desert plant poisonous to livestock, a shrub which the desert uses to reclaim its own. This field has not been farmed since 1943. When this photograph was taken only 40 acres of the 160 were farmed, all available water being used on 40 acres of alfalfa. The 1947 allotment was 0.85 acre-foot per acre, with 4 acre-feet being required. The 1948 allotment was 1 acre-foot. Taxes and water assessments are paid on 160 acres and 40 can be farmed. And, gentlemen of the committee, in my business I have a hard job when I endeavor to talk to Mr. Williams of the need for the growing of legumes and crop rotation. He has the problem of trying to grow a crop that will bring him enough cash to pay his taxes and water assessments, his interest and his living.

May I pass these pictures around as we go along?

Mr. MURDOCK. Yes, just pass them around to the members of the committee, Mr. Henness.

Mr. HENNESS. I have several other photographs which illustrate what a farmer in an area where there is not enough water is up against. Here are two taken of my neighbor's farm. The first shows land that has been uncultivated for 4 years. In the background you can see the

farmstead, which includes a $20,000 home and other improvements. Without water they are backed by little. The second shows part of another 160 acres, idle for 3 years. You can see the old cotton stalks left from that crop of 3 years before.

And here is another photograph. It shows part of the Weaver farm, 80 acres. Six years ago the owner gave up and sold this farm, which had been in his family for over 30 years. He moved to Oregon to take a job driving a delivery truck. The people who bought this farm own adjoining land and have diverted its water to that acreage.

Here is another photograph of an alfalfa field on the Kochsmeier farm. It produced one crop of hay, the first cutting. At the time this photograph was taken it should have been heavy with the fourth cutting. These photographs were taken June 13, I think. Instead, you see large burnt spots, and some thin growth on spots which happened to have a little more submoisture.

The next two photographs were taken on the Overfield farm, one of the early developed places in our county. The first shows an alfalfa field that was not watered for 2 years and in which most plants are dead. The second shows an alfalfa field to which, for those 2 years, was diverted all the water allotted the entire farm. It cost money to plant and then lose that alfalfa.

Now, let us take a look at the irrigation structures that serve these lands when there is water.

When these photographs were taken in June of 1947, Coolidge Reservoir was practically empty. The situation in 1948 was no different. Here is a photograph of the Gila River just above our Ashurt-Hayden diversion dam. Were storage water available when this photograph was taken, 1,000 to 1,200 second-feet of water would be flowing in this river which is a dry sandy bed. The photographer turned around and took a photograph of the diversion structure and gates. That is not water you see, it is dry sand and silt.

And here is another photograph taken about one-eighth mile down the canal, looking toward the diversion dam. This canal is the sole artery that carries life-giving water to the 100,000 acres of the San Carlos project. It is, as you can see, dry. No additional water can be expected until late in July or early August, when summer rains on the San Pedro River usually give some flash run-off, of which none can be stored.

One measure of conditions during a drought is the effort farmers make to help themselves. Here is the concrete-lined Pima lateral, the sole source of gravity water for the 50,000 acres of land owned by the Pima Indians. It is also dry. Here is another showing a project-owned pump pumping into this lateral. This pump provides, I would estimate, about 3 acre-feet of water each 24 hours. It is doing its best.

Here is another photograph taken further down the main canal. You can see the remains of a sandbag dam built in an effort to divert a small head of water, hardly enough to more than wet the bottom of this canal, into a turnout so it would irrigate a suffering crop.

Next is a project-owned pump pumping into a canal. In order to save evaporation and seepage, a dirt dam has been built just above the spot where the water enters the canal.

And here is a canal plugged with canvas in an effort to divert water to a dirt tank where cattle can be watered.

That is the last photograph, gentlemen. I hope these photographs have not bored you. I have used them to try and give you a visual picture of what the situation was on the San Carlos project on the 25th day of June 1947. The situation was no different in June of 1948. The situation will be better in 1949, for we now have in storage almost one-half our 1949 requirements. If additional run-off develops, the year 1949 will mark the first year since 1942 that there has been enough water for lands of the San Carlos project.

Now I want to talk to you about another estimated 200,000 acres of land in our county. This is irrigated land watered exclusively by pump. These lands have no gravity water right. They are watered by privately owned pumping plants, each representing an average investment, under present conditions, of from $10,000 to $20,000. These lands draw their water supply from underground storage, which, according to carefully kept records of the Geological Survey, is being taken out much faster than the recharge to the underground basin.

In 1931, 17 years ago, there were 69,446 acres of land in cultivation in Pinal County, most of which was in the San Carlos project. Today the total figure approximates 300,000. In 17 years our agriculture has expanded over four times. This figure of 300,000 acres represents cleared and leveled land that has been farmed, but is not a total of land farmed in any one year.

This expansion was brought about by men and women who saw rich land which needed water, and who were willing to do the hard work and make the investment necessary to develop a water supply, clear, level, and prepare the land for irrigation.

As the depth of water increases, the expense of pumping increases, the volume produced decreases, and less land can be farmed. Other witnesses will provide information on this subject.

With this expansion of agriculture has come expansion of business and growth of towns. Twenty years ago Coolidge was a small cluster of buildings around the intersection of the railroad and our main county highway. Today it is an incorporated town of around 5,000 people.

Mr. MURDOCK. Pardon me. Did not Coolidge, Ariz., at one time have a record of being the fastest-growing town in America?

Mr. HENNESS. I do not doubt that. That was said and it probably was true.

Mr. MURDOCK. You were giving the statistics on Coolidge, were you not?

Mr. HENNESS. That is right.

Mr. MURDOCK. Coolidge did have that reputation at one time?

Mr. HENNESS. I think that is right.

Mr. MURDOCK. The statistics of the census bore it out. Go ahead.

Mr. HENNESS. Eloy was only a siding on the railroad, where one pioneer farmer shipped a few cars of lettuce each winter. Today it has a population of over 3,500. I have the 1946 freight loadings for Eloy, and carlots coming in—1,552 carloads of farm produce were shipped out by rail, 1,036 of which were winter vegetables. Probably an equal volume of crops were hauled by truck. We have no record of these. Five hundred and fourteen cars of feed and supplies and manufactured goods were shipped into Eloy in the same year. Much

more was trucked in. All this business has decreased during the past 2 years, due principally to lack of water.

Such a volume of business to be sustained and increased must be based, under our conditions, upon an adequate and dependable water supply. What does the future hold?

If I am to judge the future, I must forecast separately for the San Carlos project, which receives gravity water, and the pump lands, which do not. I would say that on project lands we may have years with ample water when run-off is good, and other years of shortage such as we have experienced from 1943 to 1948. I am not a weather prophet, but that is the record. Under such conditions we can never have a permanent and satisfactory agriculture. Our farmers can never adopt those farming practices, the value of which they know so well, and which make for a successful and continuing agriculture.

And now for the pump lands. With a declining water table the future offers less water at greater expense, added investment in horsepower equipment for pumping, deepening of wells, abandonment of tens of thousands of acres to the desert, practical exhaustion of the underground water supply except in the more favored areas of shallow lift.

Some of the photographs I have exhibited show that the desert is even now, in this period of high farm prices, moving back to reclaim its own. There will be more of this, in my judgment, in the years to come. Already many good farm families have left, and more will go. Total county agricultural output will drop and incomes will in turn decline. With this will come a blighting of the investments made in the several towns of our valley by businessmen and those whose living depends upon agriculture, and by our farmers. Winter vegetable harvest and other work that now furnishes a livelihood for some 7,000 or 8,000 migrant workers, and which may, with adequate water, furnish work for 10,000 or more, will furnish fewer jobs.

I consider that our county at the present is producing less than one-half of what it could produce, were sufficient supplemental water available to firm the present supply. The future situation that I have described can be avoided through the provision of those structures that will make available additional water to firm the present supply, coupled with the wise use of our present water resources.

Thank you.

Mr. MURDOCK. If the committee will indulge me, I would like to ask a few questions first, and I would like to make some comments.

First, I would like to say that Pinal County is not in my congressional district and I am not trying to curry favor with any of these men outside my district to gain their votes or anything of that sort.

Mr. Henness, I came to Arizona in 1914. I used to ride from Tempe to Tucson, going down to Maricopa on the old Arizona Eastern, and from Maricopa to Tucson on the Southern Pacific. That was in 1914 and 1915. You knew the country at that time?

Mr. HENNESS. Yes, sir.

Mr. MURDOCK. As I looked out of the car window on those trips, across a level plain, the soil looked fertile, and I just wondered, "When will this be an agricultural empire?" Then I said to myself, "I guess it can never be."

That was in 1914 and 1915, and along through those years.

What a transformation has since occurred! It has been partly brought about by your efforts, as well as those of your neighbors. That has become an agricultural empire with all the production that you have just enumerated in your statistics.

Now you have reached the limit. It is about to decline.

I wanted to ask you about this, after my comment: If we can get 1,200,000 acre-feet of Colorado River water, part of which is to be put in this same area, will that be a sufficient supplemental supply, together with your variable rainfall, to do the job, do you think, and to bring back and revivify the acres you have already cultivated for a half dozen years or so?

Mr. HENNESS. We think it will. That assumes, of course, that we have been in a dry period.

Let me explain by saying that the background of facts on the building of the San Carlos irrigation and drainage structures—the lands that get water from Coolidge Dam—the background information indicated a water supply by gravity for 80,000 acres. It was estimated that pumping, reuse of water, would take care of another 20,000 acres, and the project was set up for 100,000 acres. Those records go back some 50 years.

I believe I am correct in saying that last year the flow of the Gila River was the lowest in some 50 years. There were years of heavy flow. You were here in 1914. If you will recall, it rained along about that time. I believe the chart shows that in 1 year, had the Coolidge Reservoir been built at that time, it would have received enough water to fill the reservoir, which would have been about 1,200,000 acre-feet, which is now a 3- or 4-year supply, and in addition it would have run over.

Assuming that the last 50 years have been an average, I think that this supply of water will take care of the situation in our county.

Mr. MURDOCK. I believe you have made it clear, but I wanted to emphasize for the benefit of the committee, that this land about which you have been speaking is a combination project.

The San Carlos project land is owned 50 percent by the Pima Indians and the rest by the white neighbors.

Mr. HENNESS. That is correct, sir.

May I step to the map a moment?

Mr. MURDOCK. Yes.

Mr. HENNESS. I have been talking about Pinal County, roughly about that area [indicating] before the ruler.

The San Carlos project is in the vicinity of Florence, Coolidge, and Casa Grande, the white-owned part.

These lands shown in green down here [indicating] are the lands owned by the Pima Indians. They have 50,000 acres. We have 50,000 acres.

Mr. ENGLE. Will you point out the Salt River Valley water users' project?

Mr. HENNESS. Yes, sir. I would say it is this area above that ruler [indicating] extending down the river. This [indicating] is the lower part of it here. You have Gila Bend, Gillespie Dam. Here is Phoenix and here is Tempe.

Mr. MURDOCK. That brings me to another observation.

This may seem to be improper, but I want to get a clear idea before the committee.

I was at the dedication of the Coolidge Dam on March 4, 1930, when ex-President Calvin Coolidge came to the dam and dedicated it.

I often say to my Republican friends that ex-President Coolidge made the second best speech made there that day. That is greeted with an inquiry.

I mean, although Will Rogers was present, that the best speech made there that day was made by a full-blood Pima Indian, and the splendid dedicatory address made by ex-President Coolidge was a splendid address, but I have always felt that it was the second best address, in view of the address made by the Pima Indian.

This Pima Indian said: "Our area 100 years ago was a garden spot. We had learned to cultivate this land and had become prosperous under the teachings of Father Kino"—the Jesuit who came into that region many, many years before—"so that when the United States Army crossed that area in the days of the Mexican War they found the Pima villages, constituting an oasis in the midst of the desert."

"But," said the Pima, "the white farmers came in on the upper Gila," meaning in Graham County and up there, "and they took the water out of the river, and the river went dry."

"Now," said this Pima who made the best speech that day, "we Indians did not expect the great white father in Washington to take the water away from the farmers in the upper river," such as Graham County.

"We did not ask for that," he said, "but we did ask for relief."

He then gave tribute to the church people who had worked as missionaries among them, and to the Government, including President Coolidge himself, who signed the bill that made the building of the dam possible, and the building of that dam was intended to give the Pima Indians, an agricultural Indian who "knows not the color of the white man's blood," that which had been taken away from them by the farmers above.

I think that is a story that needs to be impressed.

Now, as the witness has just said, had that dam been built a year or two earlier, one season's flood would have filled the reservoir, but it was finished and dedicated in 1930.

The reservoir has never been completely filled, has it?

Mr. HENNESS. No, sir. I think about 825,000, out of a capacity of 1,200,000, is the maximum.

Mr. MURDOCK. Your neighbor, Carl Anderson, has come here several times, as some of the members of this committee know. Last time he came asking for permission, which had to be obtained, to sink wells.

That project, rich as it is, is almost entirely dependent today upon pump water and has been for the last 2 or 3 years, is that not the case?

Mr. HENNESS. Yes, sir; that is true.

Mr. MURDOCK. Gentlemen, that is just one corner of the total area.

Is it not true that the Diesel stand-by plant north of Coolidge has been enlarged recently?

Mr. HENNESS. I could not say, sir. I do not think it is too recently. They have three engines there, I believe. I am not too well acquainted with that.

Mr. MURDOCK. Well, I happen to know because the item went through in an appropriation bill.

Mr. HENNESS. You would know. I should know. I live down there; but I just do not pay much attention to that.

Mr. ENGLE. May I ask a question?

Mr. MURDOCK. Yes, Mr. Engle.

Mr. ENGLE. Mr. Henness, these pictures which you passed around were illustrative of the area which had been a producing farming area, productive farming lands, but which no longer are, is that right?

Mr. HENNESS. They were no longer productive. When you say "no longer are," I do not know exactly. This last winter I mentioned we had a better run-off, and a lot of those lands are now being worked.

The first picture I showed you, for example, where the desert brush had moved in and taken over, was being irrigated the day that I left Casa Grande for a crop in this year.

Mr. ENGLE. When were these lands brought into production on the average? As much as 17 or 20 years ago?

Mr. HENNESS. Those lands shown in those photographs were practically all first subjugated in 1929.

Mr. ENGLE. There was water there once for those lands, was there not?

Mr. HENNESS. Yes; the first 3 or 4 years of our San Carlos project—I would say about 3 years—there was plenty of water. I remember in 1934 we ran out of water in June, I think.

Then there were other years in which the water supply was pretty good or very poor. Some part of that 160, for example, in the first paragraph I showed you, some part of that has been farmed every year since 1929.

Mr. ENGLE. What happened to your water supply? Is the water less, or do you have more people using it?

Mr. HENNESS. We have exactly the same acreage, 100,000 acres. It simply has not rained to provide enough water.

Mr. ENGLE. In other words, if you have another wet cycle you will probably have enough water?

Mr. HENNESS. We never have, but it would help some.

I would say this, Congressman: Over a period of years since that project was completed the water delivered has averaged probably around 2 acre-feet per acre per year, which is somewhere about half the supply necessary.

Mr. ENGLE. But there have been a lot of people down there getting into production, have there not, in the war years?

Mr. HENNESS. Not in the San Carlos project, sir. You see, these water rights are appurtenant to the land.

Mr. ENGLE. Yes; but I am speaking of outside.

Mr. HENNESS. Outside, on the pumping, there has been an increase; that is right.

Mr. ENGLE. Which would affect your total water supply one way or another?

Mr. HENNESS. It would not affect the supply of gravity water. That is the water from the river. It would have its effect on the underground water.

Mr. ENGLE. As the chairman indicated, you have been almost wholly dependent upon pumping?

Mr. HENNESS. That is true.

Mr. ENGLE. I have some figures before me which indicate that in the

area outside of the San Carlos project, in the Eloy and Maricopa areas, since 1939, there has been acquired from the State of Arizona by private parties, as indicated by the certificates issued by the State land office in Phoenix, a total of 164,937 acres, which presumably went into some kind of use.

Going into use, of course, it would be a further drain on your water supply. If not your surface supply, it would be a drain on your underground supply.

Mr. HENNESS. It is common practice in our area. The State-owned lands which are dedicated to the support of our public institutions are such that if a man wants to rent or buy these lands and develop them he does it. That sounds to me, however, like a transfer or transfers, which might very well include lands which were not devoted to agriculture, but which might be included in cow ranches for grazing.

Mr. ENGLE. That is, of course, possible, because I notice that 141,000 of the 164,000 acres are in ownerships of more than 160 acres. There are 28 family ownerships which are larger than 1,000 acres, the largest one being 6,800 acres.

What I am wondering is whether or not you have a new farm ownership in the area, not in the project but outside of the project, which has gone into this farming business during the war and during the high prices.

Mr. HENNESS. Yes, we do have. I would not attempt to say we did not. I would say definitely that there has been expansion during the war years. That expansion, however, was done by people who asked no help from anybody. They bought the land and drilled their wells and put those lands under cultivation in many cases under very difficult circumstances, due to the shortage of steel and casing and shortage of equipment and things of that sort.

Mr. ENGLE. They will be going out of business, a lot of them, when these farm prices go down, will they not?

Mr. HENNESS. I think it is possible that some of the poorer lands will go out of production. That is true of every pump district. You have in California some districts that are largely pump districts.

Those districts have a habit of expanding during periods of high prices and contracting during periods of low prices.

It is something like our dust bowl, which a lot of people worried about some years ago, and during the war when we needed wheat I understand that about 40 percent of our wheat was produced in that so-called dust bowl area.

Mr. ENGLE. Have you applied the 160-acre limitation in your county?

Mr. HENNESS. I think it is on the project; yes, sir.

Mr. ENGLE. What about this area outside the project?

Mr. HENNESS. The area outside the project is not included in any reclamation project. So far as I know, they have never received any Government money and the matter has never come up.

Mr. ENGLE. Under this proposed project there would be some readjustment necessary, would there not?

Mr. HENNESS. I do not know. There enters there a question, Congressman. This is a supplemental source of water. The question that comes up would be whether the Government, in providing part of the water supply, would want to lay down certain rules relative to the

limitation of acreage. I do not know what the answer would be there.

Mr. ENGLE. That is all, Mr. Chairman.

Mr. MURDOCK. Mr. Morris, do you have any questions?

Mr. MORRIS. I will reserve my questions at this time, Mr. Chairman.

Mr. MURDOCK. Mr. D'Ewart.

Mr. D'EWART. I would like to ask you just a few brief questions with regard to your cost of farming, and the type of contracts you have.

First, what does it cost to subdue this land? What is the leveling cost, per acre, just roughly?

Mr. HENNESS. Now or some years ago?

Mr. D'EWART. Now.

Mr. HENNESS. I would say that now on the average our average level land that does not require too much leveling would cost around $100 an acre by the time you have your land ripped and leveled and fenced, but have put in your deep well and pumping plant.

Mr. D'EWART. On top of that you have the cost of the buildings?

Mr. HENNESS. That is true.

Mr. D'EWART. And the cost of the machinery and equipment?

Mr. HENNESS. That is right.

Mr. D'EWART. In other words, it takes a pretty-good-sized investment. Whoever goes in there takes quite a loss when the water is shut off.

Mr. HENNESS. That is true. The Congressman asked me about the 160-acre limitation. In these pump lands we find it most economical to develop one well for 320 acres. It spreads the cost of that investment over a greater number of acres. By growing both winter and summer crops, we are able to utilize all or most of that land.

That is more or less the standard practice, one well for a half section.

Mr. D'EWART. What does your power cost for that pumping?

Mr. HENNESS. It is different rates. The rates change practically every year. Last year we had a shortage of power.

Coming from a lay witness, and not from an engineer, let us say that it varied from around 1⅛ cents per kilowatt to approximately 2 cents per kilowatt.

Mr. D'EWART. 12½ mills to 20 mills per kilowatt?

Mr. HENNESS. Yes, sir.

Mr. D'EWART. That is a pretty high rate.

Mr. HENNESS. We think it is quite high.

Mr. D'EWART. We would think it was high up in our country. We are, in fact, having difficulty with a 9½ mill rate in Montana.

Mr. HENNESS. We are fortunate in this respect: That one and soon another large gas main going to California passes right through the middle of a lot of this land. Many farmers in this period of shortage of electricity have moved their electric equipment aside and have run lines and put in natural-gas-burning engines.

Mr. D'EWART. That would undoubtedly come quite a bit below your 20-mill rate, and even below the 12½-mill rate.

Mr. HENNESS. Comparing the gas bill with the electric bill, I would say the gas bill would be about 30 percent. Of course, the wear and tear on an engine is, I think, much greater than that on the electric motors and transformers.

Mr. D'EWART. These hot-head Diesels operate pretty well?

Mr. HENNESS. Well, they do. I have noticed that the heavier and

slower speed the engine the more material they put into them, and the longer they run. When you sacrifice weight and get speed, sometimes they do not finish the first season.

Mr. D'EWART. I have one more line of questioning. This is a reclamation project?

Mr. HENNESS. This San Carlos project? It is an Indian-service project.

Mr. D'EWART. An Indian-service project?

Mr. HENNESS. Yes, sir. Not the Reclamation Service.

Mr. D'EWART. I see. I was going to ask: What is the status of your repayment contracts? Are the repayments current?

Mr. HENNESS. Yes.

Mr. D'EWART. Can you keep up your repayments?

Mr. HENNESS. I think our payments are current. I believe there was some legislation that provided that payments would vary according to the amount of water in storage on the first of the year, so the payments have been rather small because we have not had much water. We have just had very little water. Last year and the year before we started our season for 100,000 acres with, let us say, 25,000 or 30,000 feet of stored water, which is not very much.

Mr. D'EWART. I imagine you had a 40-year repayment period?

Mr. HENNESS. I think that is true.

Mr. D'EWART. That is what most Indian-service contracts are.

Mr. HENNESS. Yes.

Mr. D'EWART. It is your impression that they have not gone into default?

Mr. HENNESS. I do not think they have been in default, but we have not paid very much.

Mr. D'EWART. I think that is a pretty good record, considering the difficulty you have been laboring under.

Thank you very much.

Mr. MURDOCK. Mr. Marshall is one of our men who is interested in this problem, in Minnesota.

Mr. MARSHALL. Mr. Chairman, I have one or two questions that I would like to ask in order to clear up my own thinking.

In carrying on your culture practices, Mr. Henness, are you making it a practice to conserve your water as well as the land?

Mr. HENNESS. Oh, yes; every farmer has to do that.

Mr. MARSHALL. If your water supply gets short, as you picture it, do you have any other available source under which the rate could be stepped up?

Mr. HENNESS. No.

Mr. MARSHALL. Maybe your situation does not have any effect on the evaporation?

Mr. HENNESS. We simply say if we need, for instance, 100 acre-feet of water for 25 acres and we find we only have 25 feet of water, we use it on a portion of the land until it is used up; we get all we can and then wait for some more.

With reference to the conservation of water, I will say this: That in the last several years, through the development of greater interest in the conservation of water, many, many miles of ditches have been lined with concrete. The farmers have just gone along the ditches with trucks dumping concrete making miles of ditches in a very short

time. It is very costly, but many farmers have put in such ditches so they will not have seepage losses. That is the biggest loss we have, especially on sandy soil.

Mr. MARSHALL. The seepage loss?

Mr. HENNESS. Yes. And we think of soil conservation—and, of course, all of us are interested in soil conservation—we think really more about water conservation, because water is the limiting factor. Our soils are not bad to erode especially; our farm lands are pretty level.

Mr. MARSHALL. In the matter of conservation of water, has it made any difference in the kind of crops you develop; that is, have you been able to shift from one to another as the water becomes scarcer?

Mr. HENNESS. Yes. In the San Carlos project, which receives gravity water from the river, the farmers have been inclined to shift. We cannot always get the water when we want it. They may make an allotment of 85 one-hundredths acre-feet, as they did one year. But we cannot get it when we want it; and, if you are growing summer crops such a cotton or grain sorghums, those crops may burn up because you may not have water, cannot get the water on the land; so farmers on the project have tended to shift to alfalfa and grain, especially barley and winter grain, which, if you do not irrigate a barley crop, for instance, today it will be all right 10 days hence, particularly in winter. You cannot do that with cotton.

In some of the pump-land area they have grown a great deal of cotton, which has taken a supply of water, and as the supply decreased they simply have adjusted their acreage to take care of that, although we have some pump farmers who are beginning to rotate as between cotton and winter grains.

Mr. MARSHALL. I presume that most of your vegetable crops would come from the area where you do have a supply of water.

Mr. HENNESS. Our vegetable crops are mostly grown in one area. They start harvesting fairly early in the fall with carrots; they have broccoli and mustard; and then they have early potatoes in the month of June. We have grown about 3,000 acres of vegetables and potatoes.

Mr. MARSHALL. Am I correct in the assumption that your rotation in crops, your shift to alfalfa, is because it is a more drought-resistant crop than some of the other crops might be?

Mr. HENNESS. That is correct, but that is in the project area.

Mr. MARSHALL. We are talking here in terms of people, and you were talking about the increase of your population.

Mr. HENNESS. Yes.

Mr. MARSHALL. That would have quite a direct bearing on the amount of water you would have available; would it not?

Mr. HENNESS. I think it would be no more for people than it would be with the land, because with the shortage of water supply the people would not be there. The people depend upon the water, and they just disappear just like the crop acreage goes out.

Mr. MARSHALL. But you are going to take care of the people before you do the agricultural crops.

Mr. HENNESS. I do not know that I understand your question.

Mr. MARSHALL. When you come to the time when there is a shortage of water and when the crops need water, I am thinking of what you would have to do to take care of the people who use the water.

Mr. HENNESS. Yes. It would be obvious that that would be true. But they can get water from the San Carlos project to water their trees and lawns and do a lot of those things. It does not take too much water to take care of them, even though the water situation may be a little serious for the farms.

Mr. MARSHALL. Do you feel that there ought to be more restriction placed upon the farmer as to the kind of crops they grow in order to conserve the water?

Mr. HENNESS. No; I think the farmer will handle his water like he does his bank account. He places his money in the bank and knows it is in storage. He knows he has so much water in the reservoir in storage, and that water supply is like his bank statement.

I will say this: That they do not allow the farmer to waste the water. They are looking after that; there is a man who is watching that matter very closely, going from gate to gate, and if he finds water is being wasted, running out on the road, he will simply shut the gate and padlock it until the farmer makes arrangements to see that the water is not wasted. That has been done many times.

Mr. MARSHALL. That is all, Mr. Chairman, thank you.

Mr. MURDOCK. May I add this comment, or rather an observation, Mr. Marshall; that in the middle of this area—in fact, just a half mile north of Coolidge, in the Casa Grande area—are four units that were there when the white man came there in 1540, and they had been built many years before that. They had been built by people who cultivated this very land perhaps a thousand years ago, but those men are gone, are they not, speaking of the people on the Coolidge and the Casa Grande and that immediate area. They watch their water supply because they know what it means to them.

Of course, this was their main stronghold in prehistoric days. They had no implements or materials such as we have now. They had no blasting power; they had no iron or machinery to do the work.

Mr. HENNESS. May I say, Congressman Murdock, that someone has said that maybe it would be better to give the land back to the Indians; and, without water, one of these days, we may have to move out. Of course, we do joke about that, but it might happen.

Mr. LEMKE. Let me ask you one or two questions. You referred to leveling the land and that it actually cost more today then when they had to do it with smaller equipment.

Mr. HENNESS. Yes. You see now they are using the D–7 and the D–8 Caterpillar, and they cost. In the old days, they used hand methods. These Caterpillars run on a contract price, about $12 an hour, which is quite expensive.

Mr. LEMKE. I was wondering if they did not move much more ground, and do so much more work there in a given time, and if you would not break about even with what they did with the smaller machinery, even though the wages and everything else were more?

Mr. HENNESS. Yes; that is true, but yet it would not cost as much to develop the land, 40 or 50 years ago, when they did not have that kind of expense.

Mr. LEMKE. I might say that they were like the farmers then, who did not think their time was worth anything. They just kept on working anyway and did it their own way.

Mr. HENNESS. That is right; they would clear maybe an acre or two a year. My father cleared land at Buckeye in 1898 and hauled drinking water to the farm.

Mr. LEMKE. In talking to a farmer in West Virginia, and advocating the cost of production, I asked him how much he was estimating for his own labor, and he said, "Nothing; I get board and lodging." I asked him how much he was paying his wife to feed a man who was not worth anything. He said, "She is getting board and lodging, and the same is true of the children, and perhaps they were fairly content."

Just another question: What is the effect of the cold weather on fresh vegetables in your State?

Mr. HENNESS. We have some carrots where the tops were pretty badly hit. We had some cauliflower when the freeze came. The heads turned a little brown, which makes them not too merchantable.

I think there was quite a little damage to citrus. We have a little citrus in one or two counties, and there is a lot of citrus fruit beyond, over in the Salt River Valley.

Mr. MURDOCK. Mr. Aspinall, do you have any questions?

Mr. ASPINALL. No.

Mr. MURDOCK. We thank you very much for your statement, Mr. Henness.

Mr. HENNESS. Thank you.

STATEMENT OF WALTER BIMSON, PRESIDENT, VALLEY NATIONAL BANK, PHOENIX, ARIZ.

Mr. MURDOCK. We are glad to have with us at this time and will be pleased to hear Mr. Walter Bimson, who is president of the Valley National Bank, Phoenix, Ariz.

I would like to call the attention of the committee to the fact that Mr. Bimson has done more, I think, for the State of Arizona possibly than any other one man I know, in the financial realm; he has received Nation-wide recognition for that effort. I just want to say that by way of introducing him.

Mr. LEMKE. I am glad you said "in the financial realm", because I think the present chairman has done a great job in calling attention to Arizona.

Mr. MURDOCK. Let me thank you, Mr. Lemke, for that statement. We will be glad to hear you, Mr. Bimson.

Mr. BIMSON. Thank you, Mr. Chairman.

My name is Walter Bimson, Phoenix, Ariz.

I am president of the Valley National Bank of Phoenix, which has 28 banking offices located in 11 of the State's 14 counties. Our deposit customers number over 150,000, and our borrowing customers number about 100,000. All told, we serve well over a quarter of a million people through the various departments of the bank.

Needless to say, our bank and its customers are tremendously and vitally interested in the water problem of Arizona, because water is the one indispensable ingredient necessary for survival.

As a businessman, I would like to discuss some of the nontechnical and general aspects of the situation.

Frankly, it is difficult for me to understand why there is any controversy at all. The Congress of the United States has already allocated the water among the respective applicants, who in turn have legally agreed to the distribution made. The impression is becoming very strong in my mind that this so-called controversy has been invented, and is being perpetuated, by a small group of California politicians, lawyers, and engineers who have a vested interest in not getting it settled.

Certainly we have no quarrel with California as a whole, nor even with southern California as a whole. It is utter nonsense to contend that the future destiny of Los Angeles or San Diego, or any other important California city, hinges upon the water which has been allocated to Arizona.

I would like to illustrate that by the fact—which may surprise some of you—that last year, according to the report of the metropolitan water district, the city of Los Angeles used only 72,000 acre-feet of water from the Colorado River. That is at the peak of their tremendous growth, and yet Los Angeles in that year used only 72,000 acre-feet of water. That much water was used by the metropolitan water district, and the city of San Diego used only 41,000 acre-feet.

A million acre-feet of water will support an urban population of 5,000,000 people, which is more than the present combined population of Los Angeles and San Diego Counties. As to future population growth, who can say whether Arizona may not need additional water for municipal purposes just as urgently as California? Whether California uses her water supply for agriculture or city purposes is her problem—not ours.

It seems very apparent to me that our quarrel, then, is not with the cities of California but with the agricultural section known as Imperial Valley; and that, in turn, any quarrel which Los Angeles and other cities may have is not with us but with this same Imperial Valley.

As I see the situation, Imperial Valley hopes not only to deprive Arizona of its water but to monopolize most of the water allocated to California. As far as Arizona is concerned, this is a completely unwarranted and inequitable objective.

Imperial County is endeavoring to obtain this water for future use. Arizona needs the water now.

Imperial County proposes to use the water for opening up new acreage, much of it of questionable value according to the soil reports that have come to my attention. Arizona proposes to use its water entirely for the purpose of stabilizing our present acreage.

In view of these facts, let us consider briefly the comparative importance of Imperial Valley and central Arizona.

Imperial County, Calif., has a population of about 50,000 according to recent census reports. Central Arizona, comprising roughly Maricopa and Pinal Counties, has a population of about 350,000, or seven times as much.

Central Arizona, it is true, is not exclusively agricultural but its economy is primarily an outgrowth of irrigation development. At the present time, irrigated agriculture is by all odds the most important sustaining force.

Central Arizona contains approximately 50 percent of Arizona's

entire population. Retail sales in this area last year totaled nearly $400,000,000 and it is estimated that the citizens of this area contributed about $90,000,000 in Federal taxes.

For the 10-year period ending June 30, 1948, it is estimated that Federal tax contributions from central Arizona amounted to about $500,000,000.

In other words, gentlemen, we have here a vigorous, productive, dynamic economy which is not speculative or theoretical in nature but one that is both self-sustaining and contributing its share already to the national economy.

In contrast, what do we see in Imperial Valley?

We see a small group of selfish promoters attempting to deprive us and others of water, purely for the purpose of building up rights for future use.

Arizona is faced with an actual loss of acreage and production and wealth, if we do not obtain the water to which we are entitled. California's position is based on a nebulous, indefinite, potential use for additional water, if they can get it, some time in the distant future.

The relative importance of the Phoenix area in the scheme of things is set forth in the following table showing our 1948 bank-debit volume, compared with the 10 cities which stood immediately above and below us in this respect. Bank debits, as you know, are an excellent yardstick of business volume and activity.

I will not take the committee's time to read this table, but it gives the names of many important cities throughout the Nation where the area is comparable to Phoenix.

(The table referred to follows:)

Clearing house city:	*1948 bank debits*
San Antonio, Tex	$2,946,884,000
Miami, Fla	2,938,377,000
Charlotte, N. C	2,855,742,000
San Diego, Calif	2,817,406,000
Dayton, Ohio	2,781,388,000
Akron, Ohio	2,768,610,000
Syracuse, N. Y	2,717,319,000
Salt Lake City, Utah	2,678,947,000
Wichita, Kans	2,667,865,000
South Bend, Ind	2,425,060,000
Phoenix, Ariz	2,330,442,000
New Haven, Conn	2,317,159,000
Norfolk, Va	2,190,355,000
Grand Rapids, Mich	2,132,166,000
Peoria, Ill	2,054,946,000
Trenton, N. J	2,018,695,000
Springfield, Mass	2,001,323,000
Long Beach, Calif	1,931,500,000
Spokane, Wash	1,893,543,000
Youngstown, Ohio	1,861,285,000
Bridgeport, Conn	1,775,911,000

Mr. BIMSON. There is another inexcusable element in this controversy.

Even as we sit here debating who shall get somewhere between 1,000,000 and 2,000,000 acre-feet of water, approximately 9,000,000 acre-feet of water annually is flowing, unused and unproductive, into the Gulf of Lower California. In addition, I understand that more than 1,000,000 acre-feet annually of the water already being diverted

by California is flowing unused into the Salton Sea. In other words, year after year, as we discuss and argue who shall get this water, something like 10,000,000 acre-feet per annum is being wasted and lost to the economy of the Southwest and the United States.

To a simple but practical businessman, this is one of those things that "passeth all understanding." Just picture what Arizona, with its fertile soil and favorable climate, could do with 10,000,000 acre-feet of water.

Our present crop production, which was valued at about $150,000,000 in 1948, was accomplished despite the handicap of having a mere 1,408,000 acre-feet of surface water available as computed by the United States Bureau of Reclamation in its report on the central Arizona project, December 1947.

It strikes me as extremely short-sighted on the part of California to interfere with the continued development of Arizona. We are their nearest and potentially their greatest outside market. A large proportion of our imports is purchased directly from California or is brokered through California commission firms. Economically speaking, central Arizona is far more important to the merchants and manufacturers of southern California than is Imperial Valley.

Neither California nor any other area need feel that we will ever provide serious competition for them, either in agriculture or manufacturing. Approximately one-third of our agricultural output is now consumed locally, either by our own people or by our livestock. Our retail food consumption alone is more than equal to our total agricultural production, in dollar value.

Furthermore, our climate permits the growing of vegetable and feed crops during the winter months when these products are scarce and most of the agricultural land in the United States is out of production.

Arizona cannot look forward to any appreciable degree of industrialization because of its geographical isolation, high tranportation costs, shortage of water and power, and so forth. Such manufacturing as we have is primarily a byproduct of agriculture. Outside of copper smelting and the Reynolds aluminum plant in Phoenix, most of our manufacturing consist of meat packing, canning, dehydration, quick-freeze, the preparation of fertilizers and animal feed, and similar activities contingent upon or derived from agriculture. A further expansion of this type of industry is logical and desirable.

At least 40 percent of the people gainfully employed in central Arizona are directly dependent upon agriculture. Direct employment accounts for 20 to 30 percent, depending upon the season, and an additional 15 percent to 20 percent arises from supplementary activities such as packing, processing, brokerage, distribution, and transportation, or from business or service enterprises that cater to our agricultural population.

When we consider that only 1 percent of Arizona's land area has been placed under irrigation we marvel at the fact that so little has been able to produce so much. Equivalent to only 1 acre per capita, this would appear to be the minimum requirement for a nonindustrial economy supporting 750,000 people. According to the Secretary of Agriculture, it takes 3 acres per person to supply a liberal food diet.

Since our productive capacity is limited, both in agriculture and industry, Arizona constantly labors under the handicap of an adverse trade balance. In recent years, our imports have been approximately double our exports in dollar value. In short, we buy twice as much from other States as we sell to them.

As our population increases, this unfavorable balance of trade seems likely to become progressively worse, unless we can increase our basic production or utilize more profitably the production which we have.

We make no apologies for endeavoring to become more prosperous and self-sustaining.

To maintain our present level of agricultural production, we must have more water. This will assure the continuation of our present principal source of income. Based upon a stable supply of water, we shall then have a sound foundation for the expansion of these industries which depend upon agriculture for their raw materials.

With an assured level of agricultural production, and with the further expansion of agricultural processing industries, we may then raise the standard of living of our own people and contribute even more substantially to the support of the Nation.

Our agricultural lands are, in the main, provided with water through the instrumentality of either reclamation projects or irrigation districts. Most of the projects and districts have been financed by loans from the Government. These projects and the Government loans upon them will be further protected by the passage of this bill.

In asking for its passage, we are doing so as businessmen presenting a sound business proposal. An investment in Arizona is a sound investment.

With our record of high productivity, we do not believe that any like investment anywhere can produce an equally large economic return to the Nation.

Mr. MURDOCK. Mr. Bimson, I did not have the least idea what would be in your testimony this morning, but I would like for it to have been just exactly what you said. Is it not true that Phoenix has long been known as the garden spot of the Southwest?

Mr. BIMSON. Yes; I think our chamber of commerce has called it that many times, very eloquently.

Mr. LEMKE. A self-serving declaration.

Mr. MURDOCK. Mr. Bimson, I am going to monopolize the time for just a moment. You hit the nail squarely on the head, and I call my colleagues of the committee to bear this in mind all the way through the hearings, and I want to emphasize this point, that we have little real controversy between the State of Arizona and the State of California, because the State of California has really very little at stake or interest in the amount of water in this bill. I am going to bring that out when I become a witness in this case, as I expect to be. Nor is this a controversy between the State of Arizona and the city of Los Angeles or the metropolitan water district, and that is the thing I want to emphasize a little further on.

I think the gentleman who is our witness is exactly right when he says the officials of the Imperial irrigation district are trying to get water which does not belong to California and does not belong to them to use for their own selfish purpose and in so using it take it out-

side the United States. This is a matter which I think must be fully explored as these hearings proceed and I am glad to have Mr. Bimson touch on it. After all your statement is just the beginning of the evidence we will have presented in the hearing. I want to bring that to the attention of the committee so all will be put on due notice that that is the thing that must be stressed and is the point that will be stressed. We must find out the real reason for the opposition to this bill.

Mr. ENGLE. Will the gentleman yield?

Mr. MURDOCK. Yes.

Mr. ENGLE. I was going to say, Mr. Chairman, assuming for the purpose of argument that California is selfish, and that most of the people in the Imperial Valley are selfish in their effort to get this water, nevertheless, if under the law these people are entitled to the water should they not have it?

I would be glad to face that issue . I would say, Mr. Bimson, that I think you are rather hard on us. Do you attack with equal vigor the position of Nevada on this proposition?

Mr. BIMSON. No; I have no particular interest in Nevada in the project. I have said what I said to the Los Angeles Chamber of Commerce, incidentally, so I do not mind telling them what I have said here before your committee.

Mr. ENGLE. I was interested in your statement, and I think the statement you made is true, that there is a lot of water now going to waste in the Gulf of California, and it is something, as you say, that passeth understanding, but then again a lot of the people in the upper basin are entitled to the benefits which you mentioned, of some 7,500,000 acre-feet.

Mr. BIMSON. We have never questioned that.

Mr. ENGLE. Neither have we, and they are using approximately one-third. Now if you are going out to build up an agricultural economy, on a basis such as you indicate, in order to utilize the water we cannot complain if at a later date they come in and take out that water and leave those projects high and dry. It is their water whether now used or not.

The same thing is true in respect to Mexico under the Mexican treaty. They have a right to their portion of the water, and if they do not exercise it it is their fault and not ours.

Mr. BIMSON. Is that a question, Mr. Engle, may I ask?

Mr. ENGLE. Yes.

Mr. BIMSON. May I say I am not an engineer and I do not know too much about it, but it seems to me that from our point of view, and from the point of view of good business, if we can just get California to admit she would live by the agreements she signed with the United States and other parties, to limit her use to 4,400,000 acre-feet, plus one-half of the surplus, then this whole question of whether there is water enough would be settled and settled quickly and easily.

Mr. ENGLE. And you state that frankly it is—

difficult for me to understand why there is any controversy at all. The Congress of the United States has already allocated the water among the respective applicants, who in turn have legally agreed to the distribution made.

How can you argue that point, in view of the fact that Arizona went

to the Supreme Court seeking adjudication, on a declaratory basis; the right which at that time Arizona had surrendered?

Mr. BIMSON. Will you permit one of the later witnesses, who is a lawyer, to answer that question? It is above my head; I will grant you that, but I am sure the question will be answered fairly by a witness who is more expert in those matters.

Mr. ENGLE. That is perfectly all right, Mr. Bimson; I will be glad to ask it later.

Mr. MURDOCK. Mr. Bimson, you and I are not lawyers—I presume you are not a lawyer?

Mr. BIMSON. That is correct.

Mr. MURDOCK. And I am not a lawyer. But at least we know what the figure 4,400,000 acre-feet means, and we know that California agreed to that figure by an irrevocable compact, by the act of her legislature.

Mr. ENGLE. The figure 4,500,000——

Mr. MURDOCK. 4,400,000.

Mr. ENGLE. I beg your pardon; the 4,400,000 acre-feet means 4,400,000, and not 4,400,000 minus evaporation losses which might have been chargeable to Lake Mead. But when the law says 4,400,000, we think it means 4,400,000 acre-feet.

California has never disputed her obligation to stay within the limit of the act which we imposed upon ourselves; it is a State act, incidentally, not a Federal act, which gives life and vigor to that contract. In asking us to comply with that contract you are not willing that the contract be interpreted to tell what the 4,400,000 acre-feet means. As long as we are in disagreement on its meaning, we ask that that great body, which sits on the other side of the Capitol decide the issue, and I cannot think of any more democratic way of having it decided.

Mr. MURDOCK. I cannot agree with you, that Congress must ask the Supreme Court what 4,400,000 acre-feet is, but perhaps the witness would like to say something in response to your statement.

Mr. BIMSON. No, I think I had rather not; it was not a question, but was more of a statement.

Mr. ENGLE. Yes; a rhetorical statement, perhaps.

Mr. MURDOCK. Mr. Morris, do you have any questions?

Mr. MORRIS. There are many questions that I want to ask before a decision is made, but I do not want to take so much time now.

I definitely do want to find out if anything can possible be done about this waste water that is going into the Gulf of California. There ought to be some way figured out to utilize it.

Of course I realize the treaty with Mexico has to be lived up to; we cannot afford not to stay with the treaty.

However, if Mexico does not intend to use that water, we might approach Mexico with some proposal to mutually revise the treaty; it may be that we could get somewhere in trying to get Mexico to relinquish that water because I do not like to see the water wasted. I do want to find out whether there is water going to waste, especially since water is the lifeblood of the West.

Mr. MURDOCK. You are exactly right, and may I ask you once more to inquire carefully into the statement made by the witness, that more than a million acre-feet of water are being wasted annually into the Salton Sea, which is in California.

Mr. MORRIS. I have heard that there is such a waste. If that is occurring and there is some reason I think we ought to know why.

Mr. BIMSON. I think the answer to that is simply again—and I am not a technician—but as you know, it is being used to build up a use of water in order to establish a right to it. As a businessman I think the answer is that California is dumping the million acre-feet into Salton Sea just to prove a use for that much additional water. However, we will provide that information to you later in the hearings.

Mr. ENGLE. At least, she has a contract right to the water; she has a contract right to her part of 7,500,000 acre-feet, and they cannot establish an agricultural basic use for that water if they do not use it.

We have a treaty with Mexico with reference to the Colorado River. We have provided for the States in the upper basin, 7,500,000 acre-feet, according to the contract, and we cannot set up or establish an agricultural base for that——

Mr. MORRIS (interposing). Why are you not using that water now?

Mr. ENGLE. They cannot start to use it until they get an agricultural base.

Mr. MORRIS. I am just trying to find out why they are not using the water that has been allocated to them.

Mr. ENGLE. They have not had a chance. The gentleman from Colorado will bear me out; we were informed just the other day about the contract made in the upper basin, and until they had the contract they could not proceed. Now they have a legal basis on which they can proceed on the planning and construtcion of projects.

Before they built the Boulder Dam, and before we passed the Boulder Canyon Act, they had to have a contract with respect to the use of the water of the Colorado as to the utilization of the water, and with respect to any other dams that are going to be constructed. You have got to establish a right to this water, so we entered into a compact which provided for 7,500,000 acre-feet to the States in the upper basin, and 7,500,000 acre-feet to the lower basin, and when that was worked out we got the Boulder Canyon Act.

Mr. MURDOCK. This is a matter needing further explanation. Do you have any questions, Mr. Aspinall.

Mr. ASPINALL. I would like to ask two questions at this time. Do I understand that the gentleman from California, Mr. Engle, admits that there are some 10,000,000 acre-feet of water being dumped into the Gulf of California at the present time?

Mr. ENGLE. No; I wouldn't admit that. I say, of course, that there is some water going down into the Gulf; I do not know just what it is. The figure is available; I think it is somewhere around 4 to 4.5 million feet.

Mr. ASPINALL. That was one question I wanted to get straight in my own mind.

The other question is this: In your testimony, Mr. Bimson, you did not mean to imply, that the mere fact that the Imperial project was wasting, or dumping a million acre-feet into the Salton Sea, establishes any rights so far as beneficial use of water is concerned?

Mr. BIMSON. No. Again I am speaking as a businessman and not as a lawyer, because I cannot do that. I was merely implying that I think California is trying to establish as much need for water as possible, and it would be logical, I think, to assume one of the reasons

she is permitting the water to waste into Salton Sea is because she wishes to establish a need; whether a legal establishment or not I cannot say.

Mr. ASPINALL. You were not passing on the legality of it?

Mr. BIMSON. That is right.

Mr. ASPINALL. You do not have any exact figures, I understand now as to the amount being dumped into Salton Sea and the Gulf of California?

Mr. BIMSON. Yes; I think the Reclamation figures indicate that around 800,000 to 1,000,000 feet into the Salton Sea and 9,000,000 acres into the Gulf of California. That is where I get my 10,000,000, by adding the 1,000,000 that goes into Salton Sea and the 9,000,000 that goes into the Gulf of California. Those are approximate figures, but the Reclamation Bureau can give you the figures.

Mr. ASPINALL. Mr. Chairman, for Morris' information, these figures should be exact figures in answering your question, and before we conclude the hearings you should be able to get those figures.

Mr. MORRIS. Yes; my thought on that point is that we should have them, and it may be some time before the upper basin or the lower basin can set facilities to use all this water, and I would like information on that.

In the meantime it may become necessary for the Congress again to express its opinion on this, because of the legal implications involved in many things. There may be still further evidence that we have not yet explored. Water from other sources may be available. We might be able to spend a reasonable amount of money, not necessarily involving this particular project, and find other sources of water. I think it is very reasonable to assume that we will be able to take the salt out of water in the ocean. I think we might be able to get water for California, through scientific development.

Mr. ENGLE. Will the gentleman yield?

Mr. MORRIS. If this problem can be cleared up, it may be three or four years before the facilities can be set up so the lower basin can use this water, and in the meantime this can save Arizona and California——

Mr. MURDOCK [interposing]. Will the gentleman yield to me?

Mr. MORRIS. Yes.

Mr. MURDOCK. We are not here asking that we save a little water from waste and say use it for 3 or 4 years. This is similar to a bill that we had up the other day, when this committee reported out a bill for the development of the American River in California, to build the Folsom Dam as a part of the Central Valley project, which would keep so much water in storage, instead of flowing into the San Francisco Bay, as the gentleman from the great Bay area pointed out. Now we are just letting water flow through the Colorado and be wasted, and we want to minimize that if we possibly can. The same situation applies in the lower Colorado River area.

Mr. ENGLE. Here is something that may help the gentleman in his thinking concerning what happened on the Colorado River; and I want to read from a letter from the Bureau of the Budget under date of February 4, 1949, addressed to the Secretary of Interior, in which he reports first on the project, incidentally, and here is what the Budget says:

The State of Arizona says, that under the Colorado River compact, other agreements, and California's self-limitation act, Arizona has allocated to its use 3,670,000 acre-feet of water per year. It states that it is now using from the main stream of the Colorado and its tributaries in Arizona a grand total of 1,408,000 acre-feet of water per year, thus leaving 2,262,000 acre-feet for additional consumption which cannot be lawfully used elsewhere than in Arizona.

It must be remembered that Arizona is using, according to their contention, 1,408,000 acre-feet and that 2,262,000 acre-feet, which they claim is available for this project, and which we are not claiming, and which is not now being used, is further water which is flowing down the river and is being wasted. Continuing with the letter:

It estimates the consumptive use for the central Arizona project at 1,077,000 acre-feet, which together with the other planned uses will still leave in the main stream, according to the State's estimate, a balance of 619,000 acre-feet apportioned to Arizona for future use and for reservoir losses. Arizona bases its case for diversion of water from the Colorado River upon these figures and proposes to use such water as a supplemental supply for lands now inadequately irrigated. It states further that the irrigation of lands in Central Arizona has been expanded beyond the water supply of Central Arizona and that this is resulting in an exhaustion of their underground supply with insufficient surface stream flow to maintain production in the lands now irrigated. To avoid the danger to the entire economy of the State, it considers it essential that the central Arizona project be expedited.

The point I want to make is that the losses which are occurring, by water being dumped into the ocean include water belonging to the State of California and the State of Arizona. Arizona has only been using of her allotment 1,408,000 acres of water, of 3,670,000 acre-feet to which she is entitled. The rest of it is going to waste.

Mr. WELCH. I do not know how it can be remedied at this time, but the fact remains that Mexico is receiving 1,500,000 acre-feet of water from the Colorado River, that is firm water, and more than she received before the construction of Hoover Dam and Lake Mead. It is a bad treaty, so far as the United States is concerned, and it should never have been entered into.

Mr. MORRIS. I think you will agree, that even though it is a bad treaty, we must live up to it.

Mr. WELCH. We have to.

Mr. MORRIS. We have to, but that does not preclude an effort being made to change the treaty. There might be some effort made, whereby Mexico might be willing to relinquish use of some of that water.

Mr. ENGLE. I think the record ought to show that California opposed the treaty, and Arizona supported it.

Mr. ASPINALL. Is it your understanding, Mr. Welch, that the provisions of the treaty make it necessary for them to have 1,500,000 acre-feet?

Mr. WELCH. Yes. That is firm water.

Mr. ASPINALL. And even though it is being dumped into the Gulf of California still we do not have any right to object?

Mr. MORRIS. It is their water.

Mr. ASPINALL. I understand so.

Mr. MORRIS. We could not object, I understand, under the present treaty.

Mr. LEMKE. It seems to me the question we want to get at is this one relating to the construction of the contract.

Now I want to ask you a question: You referred 9,000,000 acre-feet

flowing into the Gulf of California. Does that mean water over and above the total obligation to Mexico?

Mr. BIMSON. Yes; I think that would be so.

Mr. LEMKE. I have not read the compact carefully recently, but they are interested in the continued use of that 9,000,000 acre-feet. Do you know if they have use for it?

Mr. BIMSON. You are speaking now of the Basin States?

Mr. LEMKE. Yes. They are equally interested under the compact?

Mr. BIMSON. They are equally interested; yes.

Mr. LEMKE. There is something in the compact which permits them to get their share of this water, whatever it is?

Mr. BIMSON. That is right.

Mr. LEMKE. You do not maintain that Arizona has any right to interfere with the 4,400,000 acre-feet of water going to California? I think she got the best of the bargain; that is my own conclusion.

Mr. BIMSON. We have not.

Mr. LEMKE. You and I agree you are bound?

Mr. BIMSON. We are bound under a compact.

Mr. LEMKE. And she can do with that water what she wishes, but you are opposed to water going to waste?

Mr. BIMSON. That is correct.

Mr. LEMKE. And you do not object to additional water she might be entitled to out of the 9,000,000 acre-feet; their share under the compact?

Mr. BIMSON. No; they are getting between 4 and 4.5 million; and they get in addition a percentage of the excess; one-half goes to California.

Mr. LEMKE. They got the best of the bargain there, I think.

Mr. BIMSON. We have not made any objection that I know of.

Mr. LEMKE. Whether a lawyer or a banker you know you have no right to object to what you have agreed to.

Mr. BIMSON. That is right.

Mr. LEMKE. But you maintain there is plenty of water still going to waste to take care of the other four States?

Mr. BIMSON. That is my position.

Mr. LEMKE. And to take care of this project?

Mr. BIMSON. That is my opinion.

Mr. LEMKE. I think there is an important question to be decided here.

Mr. BIMSON. Yes.

Mr. LEMKE. It is not a question about the need of it; it is not a question about the States wanting it, but you do not want it to waste; you do not want to see it go into the Salton Sea and to the Gulf of California?

Mr. BIMSON. That is right.

Mr. LEMKE. That seems to be the question before us.

Mr. MARSHALL. I have one little question that just came to my mind in connection with the point Mr. Morris brought out: In connection with this salt-water suggestion, it is my understanding that one of the problems is that involving the danger of not getting enough water to meet the requirements of the population in San Diego and Los Angeles. Now suppose that some ways and means were found under which it is practical to take salt water and make it usable, would that make any difference in this water problem?

Mr. MORRIS. No.

Mr. MURDOCK. Mr. Marshall, Senator O'Mahoney has introduced a bill to establish a pilot plant to see if sea water can be made available for human use. Not only he, but some of our colleagues in the House, especially one of our colleagues from California has introduced such a bill. I think it is highly meritorious. I can recall that a subcommittee of this committee, some years ago getting into the organization bill authorization to establish a pilot plant costing something like $30,000,000 to find out if they could extract liquid fuels from shale and low-grade coal. Now, that is important, and if there is an economical way of converting salt water into human use, in my judgment, it is just as important as extracting fuel oil from shale and low-grade coal.

Mr. MARSHALL. Suppose such a thing is found—and there ought to be further experimentation to find if it is practical to do that—what effect would that have on a compact such as we are now discussing, and what effect would that have on the treaty we have with Mexico now?

Mr. MURDOCK. It would have no effect, in my judgment, except to ease the condition.

I want my colleagues from California to understand that I am interested in the cities of California, just as Mr. Bimson has said: The cities of Los Angeles and San Diego should have an assured supply of water. They are not jeopardized by this bill and it is absolutely unfair for anybody to try, by implication or otherwise, to say that we are trying to take away from the cities of Los Angeles and San Diego an assured supply of water, to dry up the faucets in the kitchens of their homes, as has been attempted through displays spread out before us, with maps of Los Angeles. That is unfair, and that is not the proper thing to do. This deception, or attempt at deception must be exposed.

I said to Mr. Howard, from Los Angeles, that there is no jeopardy to the city of Los Angeles water supply, of 1,100,000 acre-feet. They have provision to carry a water supply to meet the needs of a population of 7,000,000, that amounts to more than a billion gallons of water daily, and that is ample, of course, for a city the size of New York. So we are not jeopardizing that. Now, that 1,100,000 feet can easily be taken from the 4,400,000 acre-feet.

Mr. BIMSON. Very easily.

Mr. MURDOCK. That is a simple mathematical problem. There are some queer mathematics involved in this matter. I doubt whether they would stand up under close scrutiny.

At least we can be sure of this: From 4,400,000 acre-feet you can subtract 1,100,000 acre-feet and have a remainder.

What is the situation with respect to Los Angeles and San Diego? California herself has set up a list of priorities for San Diego, and San Diego is last on the list, and Los Angeles is next to last, or was until the two were joined.

Now, if the sovereign State of California agrees that water for human consumption is the most important use let them take that 1,000,000 acre-feet now claimed by the Imperial Irrigation District, being dumped into the Salton Sea, and let them use it for municipal purposes. California can do that. It does not take a Supreme Court decision to do that.

Is that the gist of your feeling also, Mr. Bimson?

Mr. BIMSON. That is right.

Mr. LEMKE. May I say something to the Chairman?

Mr. MURDOCK. Yes.

Mr. LEMKE. The question has been brought up as to whether that 4,400,000 acre-feet, when given to them at Lake Mead, should be after evaporation. If California is going to be allowed evaporation, the other States have to be allowed evaporation. All they have is 7,500,000 acre-feet to begin with.

Mr. MURDOCK. Let me ask you this, Mr. Lemke, as a lawyer: Do we not find some faulty surveys in our rectangular system of land survey? Do not our meridians draw together toward the pole, so that a 40-acre tract of land may be less than 40 acres? Do we not sometimes write a deed conveying land as "40 acres, more or less"?

Mr. LEMKE. That is in every deed.

Mr. MURDOCK. That is in every deed. Why do we say "40 acres, more or less"? It is apt to be less because of the geographical features and factors.

When we say we are entitled to 2,800,000 acre-feet, that is like the 40 acres in a deed. We know it is going to be some less than that. There are certain minor deductions.

We say that when California is to get 4,400,000 acre-feet, it is like the 40 acres, more or less, that is, gross, not net.

Mr. LEMKE. The same deduction will be made from that as will be made from the 2,000,000.

Mr. MURDOCK. That is exactly the case.

Have you any further questions of Mr. Bimson, Mr. Aspinall?

Mr. ASPINALL. Mr. Chairman, the last three or four witnesses have given statements to show a decrease in the economy of Arizona, or a possible decrease. I would suggest that we have a statement of the bank clearances for the last 10 years, or bank deposits, which might be very helpful to the committee.

Mr. BIMSON. On the bank deposits?

Mr. ASPINALL. Just to show what your economy is and has been.

Mr. BIMSON. With the increasing growth in population in the State of Arizona, of course, we have had a great increase in business activity and in bank deposits. Last year, for example, the total deposits of all the banks in Arizona were about $440,000,000.

Wait just a minute and I will get them exactly. There were $413,000,000 total deposits in all Arizona banks at the end of 1947. There were about $420,000,000 at the end of 1948.

Five years ago, at the end of 1943, there were $229,000,000.

Ten years ago there were $88,000,000. That goes back to 1938.

You have had an increase in the 10-year period from $88,000,000 to $420,000,000 in deposits.

Mr. ASPINALL. Perhaps there is no relationship. In other words, the State has been continually growing in spite of the lessening of the economy because of water conditions?

Mr. BIMSON. That is right. For instance, the high prices of agricultural products during the last two or three dry years has, I think, more than offset the loss which has occurred in the total agricultural unit production.

Mr. ASPINALL. That is all.

Mr. LEMKE. May I just ask a question?

After all, those are just pencil transactions because you, of course, know that you have about $28,000,000,000 in circulation now where a little while ago you had less than $6,000,000,000.

Mr. BIMSON. That is right.

Mr. LEMKE. Your purchasing power of the dollar is only about 30 cents.

Mr. BIMSON. Yes.

Mr. LEMKE. I am not trying to criticize your statement.

Mr. BIMSON. I should have amplified that. You are entirely correct about that. That relates to bank deposits in all States, of course. I was merely pointing out that one reason has been our very rapid growth in population.

Mr. LEMKE. I can tell you of a little bank in my district which was hard pressed for $12,000 a few years ago, and it has $12,000,000 on deposit today.

Mr. BIMSON. That has been characteristic of the country.

Mr. WELCH. Mr. Chairman, before Mr. Bimson leaves the stand, a question has been raised with reference to the possibility of condensing sea water.

To sweeten or condense sea water requires fuel. California produces no coal. Therefore, it would require an enormous use of oil. May I state to the committee that from the best possible authority California's known oil reserves will not last over 10 years. That is the other horn of the dilemma.

Mr. MURDOCK. That is the other horn, Mr. Welch, and I know you are deeply interested in that. However, let me say that certain scientific men have said that atomic energy can most easily be applied to the conversion of sea water, if evaporation is the process. It is not known but that there may be chemical processes cheaper than the evaporation process.

Mr. WELCH. We will hope so.

Mr. LEMKE. I wonder if you intend to take the whole ocean for Arizona.

Mr. MURDOCK. No, Mr. Lemke. We simply want what is due us from the Colorado River. Remember that the Colorado River flows through our State for 300 miles and along the borders of our State for another 300 miles, and that the Colorado River is more than 300 miles distant from Los Angeles and that Los Angeles is right near the sea. Those are geographical facts I wanted you to have.

Mr. ASPINALL. Off the record.

(Discussion off the record.)

Mr. MURDOCK. We thank you, Mr. Bimson, for your entering into this important and interesting phase of the matter.

Mr. BIMSON. Thank you, sir.

Mr. MURDOCK. The time has slipped away, but we do have one more witness we should hear for a short period of time.

Mr. Galland, may we have a very brief statement from you at this time?

STATEMENT OF L. G. GALLAND, VICE PRESIDENT OF THE VALLEY NATIONAL BANK, PHOENIX, ARIZ.

Mr. GALLAND. This is very brief, about 5 minutes.

Mr. MURDOCK. You take your time. We will be glad to hear you for more than 5 minutes.

Mr. GALLAND. Thank you.

For more than a decade prior to my becoming associated with the Valley National Bank in the spring of 1948, I was secretary-treasurer of the Phoenix National Farm Loan Association and secretary-treasurer of the Arizona Farmers Production Credit Association in a joint office located in Phoenix, Ariz.

As secretary-treasurer of the Phoenix National Farm Loan Association, I serviced long-term farm mortgages in central Arizona for the Federal Land Bank of Berkeley, Calif. As secretary-treasurer of the Arizona Farmers Production Credit Association, I made short-term crop and livestock loans throughout Arizona, discounting this paper with the Federal Intermediate Credit Bank of Berkeley. These two associations have served the district ever since they were authorized to do so by the United States Congress—the farm loan association since 1917 and the production credit association since 1933.

The loan experience of these two companies is very definitely tied in with the financial stability of the area which they serve. A large majority of all of the loans made by each association has been on lands and agriculture and allied livestock of the Salt River project, which comprises 242,000 acres of irrigated land located in Maricopa County, Ariz.

Since 1917 a total of 2,685 farm loans have been made by the National Farm Loan Association for a total of $14,293,300. Our borrowers have weathered two depressions since we started to do business in this district. There have been very few foreclosures. The net result of these repossessions, instead of resulting in a loss to the association and the Federal Land Bank, as is usually the case, is that our real-estate account showed a profit of $61,000. This is the only association in the eleventh Federal land bank district which has shown a profit in its real-estate account.

The loan activity of the Arizona Farmers Production Credit Association did not begin until early in 1934 when agriculture was showing a slight sign of recovery from the depression which began in 1930. Consequently, the loan record of this association is not as true a barometer of the financial stability of the district as that shown in the loan history of the Phoenix National Farm Loan Association, which weathered two depressions without a loss.

I am sure you will be interested to know that our short-term credit association has made 8,337 loans for a total of over $41,883,676. Present losses in bad loans amount to $8,967, and on some of these collections are still being made.

A break-down of the loans of these two farm credit agencies shows an average farm real-estate loan per customer of $5,000 and an average short-term loan per customer of $5,100. As you will see, these loans were in the main made to small-farm operators on 40-, 80-, and 160-acre units. These farmers are the backbone of our Nation, and

their success is indicative of the stability of the area which these associations served.

The loan experience of the Valley National Bank has logically been on a much larger unit scale and total volume but the net results have been almost identical. Practically the only charge-offs were due to substantial price declines, not crop failures.

The farmers in our district are not superagriculturists. I was born and raised on a dairy farm in Wisconsin and for a number of years after receiving my degree from the university handled middlewestern farm loans for a Chicago bank. I find the farmers of central Arizona good average farmers. A large share of the unusually satisfactory results of our financing program should be credited to soil and climate. Every crop indigenous to the temperate and semitropical zones can be grown successfully in central Arizona. In fact, our rediscounts with the Federal Intermediate Credit Bank of Berkeley have shown the greatest diversity of crops of any loan company discounting through the Berkeley office. Our only handicap is a serious shortage of irrigation water which has materially affected our maximum crop production a number of times in the history of this area. Only last year, 1948, the farmers in the Salt River project were limited to 2 acre-feet of reservoir water, which resulted in a loss of at least one-third of their maximum crop potential. In dollars this meant a minimum of $20 per acre loss in staple crops, such as alfalfa.

An adequate irrigation water supply will make central Arizona outstanding in the agriculture of America.

Mr. MURDOCK. A few of our Members had to leave, as they stated to me, but, Mr. Galland, I am going to see to it that every one of them has a copy of this before it is put in print.

Mr. GALLAND. Thank you.

Mr. MURDOCK. I appreciate it as showing a business basis for the situation as it now exists; and indicating, also, the possibility of great damage when the situation becomes changed.

Mr. GALLAND. That is right.

Mr. MURDOCK. Have you any questions?

Mr. LEMKE. I have just one question, if the witness can answer: Do you know how many acre-feet of water this project would take if completed?

Mr. GALLAND. How many acre-feet of water?

Mr. LEMKE. Yes, sir; for this particular project.

Mr. GALLAND. This Salt River project?

On an average, if they had one additional acre-foot of water per acre per year it would stabilize their irrigation system to practically an ideal degree. One acre-foot of water would be possibly 242,000 acre-feet.

Mr. LEMKE. What would be the total you would need?

Mr. GALLAND. For this particular project, the Salt River project, they have 242,000 acres. My contention is that the 750,000 acres of land irrigated in central Arizona, if it received an average of 1 to 1½ acre-feet per year additional water would firm up the entire project.

Mr. LEMKE. Your conclusion is that there is plenty of water to do that and to give California all she is entitled to?

91190—49—ser. 11, pt. 1——11

Mr. GALLAND. All she is entitled to under the Boulder Canyon Act and the compact.

Mr. LEMKE. Thank you.

Mr. MURDOCK. Mr. Marshall.

Mr. MARSHALL. I have just one question which bothers me a little. In your work you advise farmers quite often as to what they may do in their agricultural enterprises, I am sure. They, no doubt, come to you as they do to the men in your capacity of my area, and ask about the prospects.

Mr. GALLAND. I get a great deal of that.

Mr. MARSHALL. I noticed when you were talking about crops in your statement that you talked about a number of crops which can be grown in that area.

Mr. GALLAND. That is right.

Mr. MARSHALL. There were some of those crops, like citrus fruits and dates, crops like that, which take some years of investment.

Mr. GALLAND. Surely.

Mr. MARSHALL. At the present time can you advise your farmers to plant those crops, with the water conditions you have?

Mr. GALLAND. Not unless we had assurance of a better water supply.

Mr. MARSHALL. You feel you could if this water were firmed up?

Mr. GALLAND. Absolutely.

Mr. MARSHALL. Thank you.

Mr. MURDOCK. We thank you very kindly for that statement, Mr. Galland.

Mr. GALLAND. Thank you, sir.

Mr. MURDOCK. I want to thank the committee for being willing to come on Saturday morning, a thing which we do not ordinarily do. In fact, we have had a practice against doing it, but as a special favor to these witnesses who have come long distances we have done so.

The committee will stand adjourned until 10 o'clock Monday morning.

(Thereupon, at 12:20 p. m., Saturday, April 2, 1949, an adjournment was taken until 10 a. m. Monday, April 4, 1949.)

THE CENTRAL ARIZONA PROJECT

MONDAY, APRIL 4, 1949

HOUSE OF REPRESENTATIVES,
SUBCOMMITTEE ON IRRIGATION AND RECLAMATION
OF THE COMMITTEE ON PUBLIC LANDS,
Washington, D. C.

The subcommittee met, pursuant to adjournment, at 10 a. m. in the committee room of the House Committee on Public Lands, New House Office Building, the Honorable John R. Murdock (chairman of the subcommittee) presiding.

Mr. MURDOCK. The subcommittee will please come to order.

This is a continuation of the hearings on H. R. 934 and H. R. 935.

As previously stated, there are five subcommittees of the Committee on Public Lands. This is the Subcommittee on Irrigation and Reclamation. It is rather difficult for us to have the use of the committee room as long and as often as we would like to have it. Sometimes, to expedite matters and take care of witnesses from distant points, it is necessary to have two or even three subcommittee meetings going on in our limited space.

Gentlemen are here from Alaska attending another subcommittee meeting in an adjoining room, and that accounts, in part, for the absence of some of our committee members at this moment.

We have with us at this time Mr. Knapp, a resident of Tucson, Ariz., I believe, and a water authority and student of Colorado River matters.

Mr. Knapp, we would be glad to hear you at this time.

STATEMENT OF CLEON T. KNAPP, ATTORNEY, TUCSON, ARIZ.

Mr. KNAPP. Mr. Chairman and members of the committee, I do not know whether it is permissible to disagree with the chairman, but I have never claimed to be a water authority and I do not represent the State of Arizona or anyone. I have been invited to appear and make some observations on H. R. 934.

My name is Cleon T. Knapp, of Tucson, Ariz. I have practiced law in Arizona for over 35 years and I am here at the invitation of the Arizona Interstate Stream Commission, and the Central Arizona Project Association, to discuss certain legal aspects of H. R. 934, which proposes to divert main stream water of the Colorado River into central Arizona. My remarks will be directed to the water phases involved in the proposed project and in particular to the respective rights of Arizona and California in and to the waters of the Colorado River. Before exploring the areas of contentions made by the respective States, reference might be made to the instruments and laws,

sometimes referred to as the "Law of the River," and also to Arizona's objective.

At this point I would like to state that I believe it was Mr. Lemke, and perhaps one or two other members of the committee the other day who referred to their desire to hear something with reference to the availability of water; and what I shall discuss is the legal availability of water.

Following me there will be engineers who will, of course, discuss the actual availability. I thought that Mr. Engle of California made a very good statement to the committee at the beginning of these hearings, in which he outlined the contentions between California and Arizona. I propose to touch upon those very contentions that Mr. Engle pointed out.

First is as to the law of the river.

A. Colorado River compact (Santa Fe compact): Negotiated at Santa Fe, N. Mex., in 1922, by Wyoming, Colorado, Utah, New Mexico, Arizona, Nevada, and California. The four first named are known as the "Upper Basin States"; the last three as the "Lower Basin States."

B. Boulder Canyon Project Act: Passed by Congress in 1928 (45 Stat. 1057). (This act required California to pass the California Limitation Act.)

C. California Limitation Act: Passed in 1929 by California Legislature. (By this act California renounces any claim to waters of the Colorado River, except the 4,400,000 acre-feet of III (a) water (main stream), plus not more than one-half of the excess and surplus water unapportioned by the compact.)

D. The California system of priorities.

E. The United States-California Contracts: Made in accordance with California system of priorities.

F. The United States-Arizona Contract.

G. The United States-Mexican Treaty.

H. Upper Colorado River Basin compact: Negotiated October 11, 1948, by Arizona, Colorado, New Mexico, Utah, and Wyoming.

Now, as to the Arizona objective. Arizona in relying on its right to use III (a) (main stream) water has pending before Congress, H. R. 934 and H. R. 935, seeking authorization of construction of a project to divert main-stream water into central Arizona. It is not intended to use such water to irrigate new lands, but only to meet the supply of irrigation needs of lands now in cultivation, a portion of which will have to go out of cultivation unless this project is developed.

What is the Colorado River compact, sometimes called the Santa Fe compact?

For 10 years after Arizona was admitted to statehood there was considerable discussion concerning development of the river, but no definite action was taken until the year 1922, when at the famous meeting in Santa Fe, N. Mex., the Colorado River compact was negotiated. It is significant to observe, in connection with the negotiations which led to the final drafting of the compact, that:

A. The commissioners representing the various States comprising the compact commission early in their negotiations found that they did not have sufficient data from which allocations could be made of definite amounts of water to each of the seven States involved, and

when it was found impossible to make the allocations upon this basis, it was agreed to make an apportionment of the waters of the Colorado upper basin, and 7,500,000 acre-feet annually to the lower basin.

B. When the division point between the upper and lower basins was agreed upon, to wit: Lee Ferry, the virgin flow of the river at that point was proposed to be apportioned 7,500,000 acre-feet to the upper basin, and 7,500,000 acre-feet annually to thelower basin.

C. The commissioner representing Arizona, W. S. Norviel, raised the question as to what disposition was to be made of waters of the Gila River and its tributaries in Arizona, and after considerable discussion, it was decided that an additional million acre-feet should be apportioned to the lower basin, ostensibly for the purpose of taking care of uses already being made of the Gila River in Arizona.

The pertinent parts of the compact as finally adopted are contained in article III, under which article the waters of the river are divided.

Article III. Paragraph (a): By this paragraph the waters of the river are divided at Lee Ferry and 7,500,000 acre-feet per annum are apportioned in perpetuity to each the upper and lower basins.

Paragraph (b): This paragraph provides:

In addition to the apportionment in paragraph (a), the lower basin is hereby given the right to increase its beneficial consumptive use of such waters by 1,000,000 acre-feet per annum.

That is the important paragraph to which I shall address my remarks for several minutes.

Paragraph (c): This paragraph recognizes the right of Mexico to the use of waters from the system and provides that such rights shall be satisfied, first, out of the surplus over and above the quantity specified in paragraphs (a) and (b); then, if such surplus proves insufficient, that the deficiency shall be borne equally by the upper and the lower basins.

Paragraph (d): This paragraph provides that the States of the upper basin shall not cause the flow of the river at Lee Ferry to be depleted below an aggregate of 75,000,000 acre-feet for a period of 10 years.

Mr. MILLER. I have one question, Mr. Chairman, at this point; if the witness please.

I want to get clear in my mind the relation of the 7,500,000 acre-feet over a period of 10 years. Might that mean that in some years they would get 6,000,000 acre-feet and perhaps the next year 9,000,000 acre-feet, which would be an average of 7,500,000 acre-feet? Does it have to be 7,500,000 acre-feet for each year, or might some years fall below 7,500,000 acre-feet?

Mr. KNAPP. Yes.

Mr. MILLER. So that the 10-year average would be 7,500,000 acre-feet; or 75,000,000 acre-feet for the 10 years; is that right?

Mr. KNAPP. Yes. Paragraph (d) will answer fully:

The States of the upper division will not cause the flow of the river at Lee Ferry to be depleted below an aggregate of 75,000,000 acre-feet for any period of 10 consecutive years reckoned in a continuing progressive series, beginning with the 1st day of October next succeeding the ratification of the compact.

Mr. MILLER. Then you would say it would be possible to have 6,000,000 acre-feet one year and 9,000,000 acre-feet the next year and still meet the terms of the agreement or compact?

Mr. KNAPP. If that full amount were met.

Mr. MURDOCK. Mr. Knapp, after this answer, would you prefer to have a continuous connected presentation?

Mr. KNAPP. I think it would be helpful for the committee, and I know it would help me. I think many of the questions you might propound I will have answered. I have tried to anticipate them, and I think it would save time as I go along.

Mr. MURDOCK. Very well.

Mr. KNAPP. Paragraph (e): This paragraph provides that the States of the upper basin shall not withhold and the States of the lower basin shall not require the delivery of water which cannot reasonably be applied to domestic and agricultural uses.

Paragraph (f): This paragraph provides for further equitable apportionment of the water of the system unapportioned by paragraphs (a), (b), and (c); such apportionment to be made after October 1, 1963, and only when either basin shall have reached its total beneficial consumptive use of water as set out in paragraphs (a) and (b).

That is the division of the surplus waters of the river.

Paragraph (g): This paragraph sets up the machinery by which this further apportionment may be made.

Contentions: Now what are the principal points of disagreement between Arizona and California? They can be narrowed to three, namely:

First: Why did the compact commission increase the beneficial consumptive use by 1,000,000 acre-feet per annum to the lower basin, as provided in article III (b) of the compact?

Arizona contends the said 1,000,000 acre-feet was apportioned for the sole benefit of Arizona and in recognition of uses and established rights by Arizona over a period of years in the waters of the Gila and its tributaries.

California contends the waters of the Gila should be considered "surplus" waters, and to part of which California would have a right when surplus waters are divided after 1963.

Second: What construction and interpretation should be placed upon the words "beneficial consumptive use" as used in the compact?

Third: What is the legal effect of the California Limitation Act, which was enacted by its legislature in 1929, by which it limited itself to 4,400,000 acre-feet per annum of main stream water, and not more than one-half of the excess and surplus water.

Now, then, we take up contention one: Gila River, 1,000,000 acre-feet.

Aside from the record, what California is trying to do is to have that 1,000,000 feet tabbed as surplus water, because she would then get, when that surplus is divided, one-half or 500,000 acre-feet. That is what we now are talking about. She is either entitled to it, if it is surplus, or she is not, if it is not surplus, and it belongs to Arizona.

The record is clear and unanswerable regarding the first point of contention, namely, the 1,000,000 acre-feet. It is apportioned water in recognition solely of Arizona's uses and rights in the Gila River, and not surplus water, as California contends.

Hon. Thomas E. Campbell, as Governor of Arizona, attended the Santa Fe conference in November 1922. His testimony, given before the Arizona Colorado River Commission in 1933, appears in hearings

before the Committee on Public Lands, United States Senate, Eightieth Congress, on S. 1175, pages 224–226 (hereinafter referred to as hearings S. 1175), and is in part, as follows:

Q. Was there any agreement between the Arizona representative and the representatives of the other lower basin States as to setting aside to Arizona the water described in paragraph III (b) of the proposed compact?

A. Yes. There was a definite understanding that after the seven-State compact was ratified, so far as the three States in the lower basin were concerned, they would enter into a compact in which it would be agreed that all of the water of the Gila River would go to Arizona.

Q. Who were present at the discussions which resulted in that understanding?

A. Mr. McClure, of California; Mr. Scrugham and Mr. Squires, of Nevada; and Mr. Norviel and myself, of Arizona.

Q. Did these discussions take place before the execution of the compact on November 24, 1922?

A. That understanding was arrived at before the compact was ratified and signed.

Q. For what purpose was the water of the Gila River to go to the State of Arizona?

A. For the benefit of Arizona and for use in irrigation.

Q. At the time the discussions were had with reference to putting this paragraph III (b) into the compact, did all of the delegates to the conference know that Arizona had objected to the compact without such a provision?

A. Absolutely; they all knew that was the fact; it was the lock upon which we had stuck for a couple of days, and discussions were had by all of the delegates and commissioners—I assume these discussions would appear in a transcript of the minutes; the fact was well-known and discussed by everybody present. Without that provision of III (b), by which Arizona was awarded an extra million acre-feet of water for the inclusion of the water of the Gila River, the compact would never have been signed by Arizona.

Q. Then after the arrangement was made for the inclusion of paragraph III (b) in the compact, it met with the approval of Arizona, and Mr. Norviel signed the compact for Arizona?

A. He did.

Mr. W. S. Norviel, as Arizona water commissioner, was a member of the Santa Fe Compact Commission. Likewise his testimony appears on pages 228–229 of said hearings, S. 1175, and is in part as follows:

Q. What discussion was had relating to the said paragraph (b) of article III and its meaning and purpose?

A. It had steadfastly refused to agree to the original draft that merely included the Gila River and after several days of discussion and argument, during which the conference refused to exclude the Gila and I refused to accept the draft which included the Gila, a compromise was reached in the form of article III (b) which provided the extra million acre-feet to compensate Arizona for the inclusion of the Gila River in the Colorado River system. It was fully understood by all that this million acre-feet was for the sole and exclusive use of Arizona, although the language used provided for its use by the lower basin. I have explained why such wording was used.

Q. Was the answer that you have given of the meaning and purpose discussed at the full meeting of all the delegates at this conference, including California and Nevada?

A. Yes. All of the delegates, including California and Nevada, understood and agreed that this additional water was for Arizona's use.

Q. Will you state if you made any statement to the Colorado River Commission with reference to the definition given to the Colorado River system and the Colorado River Basin, and the meaning of paragraph (b), article III?

A. Yes. I did make a statement. I asked the conference if it was the understanding of the Commission that the million acre-feet of water set out in article III (b) was for the sole and exclusive use of Arizona, and stated that if that was the understanding, I would sign the compact, if it was not the understanding, I would refuse to sign. The unanimous reply was that this million acre-feet

was for Arizona alone. With that understanding, I signed the compact for Arizona.

Q. Were these statements which you made stated to the open conference?

A. All delegates and representatives were present. We were having a final meeting preparatory to the signing of the compact.

Q. What response did delegates from the other States, including California and Nevada, make it regard to your statements?

A. They agreed in the understanding which I have just stated. Mr. McClure, of California, stated to me and to the conference that he, as the California representative at the conference, agreed to the understanding that this water of article III (b) was for the exclusive use of Arizona.

Q. At that time, what, if anything, was said in reference to the tri-State agreement between the representatives of California and Nevade and Arizona and Mr. Hoover?

A. It was several times suggested that there should be no difficulty for the three lower States to agree to a division of the waters allocated to the lower basin.

Q. Were these statements, with reference to a tri-State agreement, made prior to the time the compact was actually signed?

A. Yes; and Mr. Squires made some statements afterward. Mr. McClure, Mr. Scrugham, and Mr. Squires expressed their willingness to enter into such a compact. It seemed very feasible.

Q. Did each and every one signing the Colorado River compact know of the discussion with reference to the supplemental tri-State compact to be executed by California, Nevada, and Arizona?

A. Yes. It had been discussed in the open conference and Mr. Hoover made several suggestions regarding such a tri-State compact.

Q. Was there every any statement made by anyone at the conference that the waters of the Gila River were to go to anybody except the State of Arizona?

A. None whatever.

Q. Was any claim ever made at that time that any other State had any interest in the waters of the Gila River?

A. No.

Q. Was there an universal agreement by each and every one of the delegates that the Gila River belonged to the State of Arizona?

A. That was the agreement upon which I consented to sign the compact for Arizona.

Q. In addition to the waters of the Gila River, was Arizona to participate in the division of the waters in the main stream of the Colorado River?

A. Yes. Arizona was to share in the main stream waters.

Q. Were these matters discussed at the time of the conference?

A. Yes. To the extent that Arizona, Nevada, and California were to all share in the main stream waters and Arizona was to have the exclusive use of the waters of the Gila.

Q. Did you make any statement that if the Colorado River had any different meaning from what you have testified, you would not sign the compact?

A. I stated that I would absolutely refuse to sign the compact if it had any other meaning.

Q. Did the representatives of the other States and the chairman agree to your statement?

A. Yes. All, including California and Nevada, agreed.

Governor Campbell and Mr. Norviel are dead. Both were men of high honor and integrity. I might add that I attended the meetings in Santa Fe, though not the executive sessions of the Commission, and I know that those men spoke the truth.

All of the compact negotiations at Santa Fe were presided over by Herbert Hoover, of California, then Secretary of Commerce, who had been designated as the Federal representative. Apparently Mr. Hoover had been deeply impressed by the gallant fight made by Mr. Norviel, because on November 26, 1922, two days after the Santa Fe compact was signed, he wrote the following:

MY DEAR NORVIEL: This is just by way of registering again my feelings of admiration for the best fighter on the Commission. Arizona should erect a monument to you and entitle it "One Million Acre-Feet."

Then, to remove any question whether the 1,000,000 acre-feet is apportioned water, as Arizona contends, or excess or surplus water, as California contends, Herbert Hoover, in reporting the proceedings to the Speaker of the House of Representatives (Doc. 605, 67th Cong., 4th sess.), stated:

Due consideration is given to the needs of each basin, and there is apportioned to each seven and one-half million acre-feet annually from the flow of the Colorado River in perpetuity, and the lower basin an additional million acre-feet of annual flow, giving it a total of eight and one-half million acre-feet annually in perpetuity.

Now, stepping aside from my prepared statement, I wish to refer to a response which Herbert Hoover gave to a letter written him by Senator Hayden, which further confirms that this, in Herbert Hoover's opinion, was not surplus water, as California contends, but apportioned.

Herbert Hoover, in response to an inquiry from Senator Hayden, makes it definitely clear that the 1,000,000 acre-feet provided for in III (b) is apportioned water when in reply he said—I refer here to Senate Joint Resolution 145, page 220:

I do not think there is any change in the basis of division as the result of the difference in language in articles III (a) and III (b). The two mean the same.

Now the language in article III (a) says:

There is hereby apportioned from the Colorado River system in perpetuity—

If, in the opinion of Herbert Hoover, article III (b) means the same, it means that that was likewise apportioned to the lower basin.

It surely is clear from the foregoing that it was the intent of the compact commission and the understanding of Herbert Hoover that the 1,000,000 acre-feet apportioned to the lower basin by III (b) of the compact was solely for the benefit of Arizona.

Now, what construction did Congress place on III (b)? Congress enacted the Boulder Canyon Project Act, effective December 21, 1928, which resulted in the construction of Boulder Dam (Hoover Dam) and the creation of Lake Mead. Section 4 (a) of said act provides that:

The States of Arizona, California, and Nevada are authorized to enter into an agreement which shall provide (1) that of the 7,500,000 acre-feet annually apportioned to the lower basin by paragraph (a) of article III of the Colorado River compact there shall be apportioned to the State of Nevada 300,000 acre-feet and to the State of Arizona 2,800,000 acre-feet for exclusive beneficial consumptive use in perpetuity, and (2) that the State of Arizona may annually use one-half of the excess or surplus waters unapportioned by the Colorado River compact, and (3) that the State of Arizona shall have the exclusive beneficial consumptive use of the Gila River and its tributaries within the boundaries of said State. * * *

It will be noted that Congress apportions 7,500,000 acre-feet annually to Arizona, California, and Nevada out of the main stream (III (a), of which 2,800,000 is apportioned to Arizona), plus one-half of excess or surplus waters, and in addition thereto the "exclusive beneficial consumptive use of the Gila River and its tributaries," for which the 1,000,000 acre-feet was apportioned by III (b) all as shown by the Campbell, Norveil, Hoover proof.

How did the Department of the Interior construe the compact and the Boulder Canyon Project Act with respect to the Gila, and the 1,000,000 acre-feet?

Ray Lyman Wilbur, of California, Secretary of the Interior, on February 7, 1933, promulgated regulations to cover a proposed water delivery contract between the United States and Arizona. Attached to such regulations was exhibit A, the form of contract, which provided for the delivery of water to Arizona at points of diversion on the Colorado River so much available water as may be necessary to enable the beneficial consumptive use in Arizona of not to exceed 2,800,000 acre-feet annually by all diversions effected from the Colorado River and its tributaries below Lee Ferry "but in addition to all uses from waters of the Gila River and its tributaries. * * *"

Again, there is a recognition that the Gila water uses were solely for Arizona in addition to the apportionment from the Colorado itself. Contracts actually entered into with the three lower basin States were different in form, but provide that each is subject to the provisions of the Colorado River compact.

The contract between the United States and Arizona is dated February 9, 1944, and provides that—

> the United States shall deliver and Arizona * * * will accept under this contract each calendar year from storage in Lake Mead * * * so much water as may be necessary for the beneficial consumptive use * * * in Arizona of a maximum of 2,800,000 acre-feet.

But of particular significance is paragraph 7 (e). This paragraph provides in part that—

> this contract is for permanent service, subject to the conditions stated in subdivision (c) of this article, but as to the one-half of the waters of the Colorado River system unapportioned by paragraphs (a), (b), and (c) of article III of the Colorado River compact, such water is subject to further equitable apportionment at any time after October 1, 1963. * * *

It will be noted that the Department of the Interior by using the words "unapportioned by paragraph (b)" clearly recognizes that the waters (1,000,000 acre-feet) allotted under paragraph (b) are apportioned waters and not surplus waters. It follows that California, therefore, has no right in or to the 1,000,000 acre-feet.

Judge Clifford H. Stone, of Colorado, director of the Colorado Water Conservation Board, commissioner for Colorado on the Upper Colorado River Basin Compact Commission, an outstanding lawyer and student of Colorado River problems, testified in the hearings, S. 1175, page 513 and following. Judge Stone may testify before this committee, but I was impressed with his previous testimony, and not coming from either Arizona or California, he might properly be classified as an impartial observer. I take the liberty of quoting a few lines. Judge Stone stated:

> 1. Is the water covered by paragraph (b) of article III of the Colorado River compact excess or surplus waters unapportioned by the compact, and has California, by the terms of the Limitation Act, renounced any claim to the 1,000,000 acre-feet by which the lower basin may increase its beneficial consumptive use?
>
> It is my position that the 1,000,000 acre-feet of water, covered by paragraph (b) of article III of the Colorado River compact, is apportioned water to the lower basin. It is not excess or surplus water unapportioned by the compact.

Still quoting Judge Stone:

> Paragraph (b), article III, reads:
>
> "In addition to the apportionment in paragraph (a), the lower basin is hereby given the right to increase its beneficial consumptive use of such waters by 1,000,000 acre-feet per annum."

This paragraph follows paragraph (a), which provides:

"There is hereby apportioned from the Colorado River system in perpetuity to the upper basin and to the lower basin, respectively, the exclusive beneficial consumptive use of 7,500,000 acre-feet of water per annum, which shall include all water necessary for the supply of any rights which may now exist."

Article III contains a paragraph (f) which, since the compact was approved by the Congress in 1928, has been commonly understood as the only provision of the compact defining excess or surplus waters of the Colorado River system, unapportioned by other provisions of article III.

Judge Stone says:

This paragraph is important, and I shall discuss it extensively. It reads:

"Further equitable apportionment of the beneficial uses of the waters of the Colorado River system—"

and I wish the committee would note these reports—

"* * * unapportioned by paragraphs (a), (b), and (c) may be made in the manner provided in paragraph (g) at any time after October 1, 1963, if and when either basin shall have reached its total beneficial consumptive use as set out in paragraphs (a) and (b)."

Then Judge Stone at length presents an unanswerable argument, refuting the California contention that III (b) (1,000,000 acre-feet) is surplus water in which it has an interest under the compact, and he further states:

It is my position that the language of the Colorado River compact, respecting apportioned water and that which is unapportioned, is so clear and unambiguous that there is no necessity of going beyond the language of the instrument itself to understand its terms, conditions, and provisions, which were ratified by the legislatures of the signatory States.

And then Judge Stone refers to a decision of the United States Supreme Court, which effectively answers the question. I quote:

The Supreme Court of the United States supports the contention which we here make. In *Arizona* v. *California* (292 U. S. 341), the Court did not sustain Arizona's claim that the 1,000,000 acre-feet covered by III (b) water was specifically apportioned to Arizona alone. However, this same case held that III (b) water was apportioned to the lower basin. It also held that there is no ambiguity in article III (b) of the compact. It, accordingly overreuled the contention which California now makes that III (b) water is unapportioned.

End of the statement by Judge Stone.

Arizona respectfully submits that the foregoing records show conclusively that—

(*a*) The compact commission, in adding III (b) 1,000,000 acre-feet to the compact, did so for the sole benefit of Arizona, and in recognition of uses and established rights in the waters of the Gila and its tributaries in Arizona.

(*b*) The said million acre-feet of water is apportioned water and not excess or surplus water in which California has any legal right or interest.

(*c*) Arizona has a legal right to 2,800,000 acre-feet annually from main stream waters of the Colorado, plus one-half interest in any surplus water that may be divided after October 1, 1963, plus the waters of the Gila to the extent of 1,000,000 acre-feet annually.

At this point I would like to make the conclusion that we started out talking about 500,000 acre-feet. If it is surplus, California at some time would get that amount, when the surplus water is divided. If it is not surplus water and it is properly labeled "apportioned water" as I think the record clearly shows, California has no interest in it and the 500,000 acre-feet of water can be set up on the credit side of

Arizona's ledger, and considered as water legally available, as was asked about by the committee earlier.

I merely wanted to say to Mr. Engle, if I might, at the beginning you set up the points of contention between California and Arizona. I think you set them up very clearly and accurately, and I am following those contentions and setting up the rights which Arizona contends she has.

Now we come to contention two, beneficial consumptive use. I wish to refer to the theory of it.

What is the meaning of the words "beneficial consumptive use" as used in the Santa Fe compact? Remember that the division of the water of the Colorado River made by the compact commission was based on the virgin flow of the river, not on all of the water that fell in the basin and that was lost by evaporation, seepage, or transpiration before it reached the main stream.

Permit me, again, to step aside from my prepared statement to say that there is a difference here between California's contention and Arizona's contention of approximately 1,200,000 acre-feet.

Following the method that California claims should be followed in determining beneficial consumptive use as against Arizona's contention that it should be by depletion at the mouth of the stream, there is a difference between the two of 1,200,000 acre-feet.

Now, then, if that could be held to be surplus water, just as in the case of the 1,000,000 acre-feet, sometime California, when surplus waters are divided, would be benefited to the extent of 600,000 acre-feet.

What we are arguing about now is 600,000 acre-feet.

The flow of the main stream at Lee Ferry just below the Arizona-Utah line was the deciding factor in the division between the upper and lower basin States. Remember also, that the Gila River flows into the Colorado River just above the Mexican boundary and below any diversion point on that river. That none of the waters of the Gila River can be or were ever used in California. That the use of Gila River water is that made by Arizona and is principally in its development of the central portion of the State. A number of storage dams have been built on the Gila River and its tributaries in Arizona, and practically all of the waters of that river are now and have been for many years past put to beneficial use. By the construction of these storage dams, water is used that would otherwise be lost by evaporation, seepage, and transpiration. This is salvaged water and never would have reached the main stream of the Colorado.

Arizona contends that in the use of Gila River water, it should be charged with the amount only that it depletes the main stream of the Gila, where that stream joins the Colorado. This interpretation is joined in by all the upper basin States. Consumptive use according to the dictionary means the act of consuming—of destruction. There is no practical way to measure beneficial consumptive use of water of any flowing stream except by the resulting depletion of that stream. A diverter of water does not consumptively use all of the water diverted, but is entitled to credit for all return flow reaching the stream which may be at some distance below the points of use. Therefore, it would follow that depletion of the flow of the stream should be related to the next control point below the point of use, which in the case of the Colorado River will be Lee Ferry for the upper basin,

and the compact so provides, at State lines as between States, and at the international boundary, with reference to water delivered to Mexico.

In reviewing the negotiations and considering the language of the Colorado River compact, all of the river contracts, the upper basin compact, the Boulder Canyon Project Act, and the California Limitation Act, it seems to me that it is clear that the States as States are also entitled to credit for return flows reaching their boundaries, and that the upper basin States are entitled to credit for any return flow that reaches Lee Ferry, that being the control point; that, therefore, each State of the upper basin is entitled to have its beneficial consumptive use measured by the resulting depletion of the main stream at Lee Ferry. The depletion of the Gila by Arizona can now be measured at Dome, a measuring station on the Gila just above its confluence with the Colorado River.

Depletion is the clearly established yardstick by which to measure the beneficial consumptive uses of the Gila, as will appear from the following documents, laws and decisions:

Santa Fe compact, article III (d).

The States of the upper division will not cause the flow of the river at Lee Ferry to be depleted below an aggregate of 75,000,000 acre-feet for any period of 10 consecutive years reckoned in continuing progressive series beginning with the first day of October next succeeding the ratification of this compact.

Boulder Canyon Project Act, section 4.

This act, referring to the 4,400,000 acre-feet allotted to California, provides—

* * * that the aggregate annual consumptive use (diversions less returns to the river) of water of and from the Colorado River for use in the State of California. * * *

That means depletion.

California Water Limitation Act, section 1. California adopts the Boulder Canyon Project Act and—

agrees irrevocably and unconditionally with the United States and for the benefit of the States of Arizona, Colorado, Nevada, New Mexico, Utah and Wyoming as an express covenant and in consideration of the passage of the said Boulder Canyon Project Act that the aggregate annual consumptive use (diversions less returns to the river) of water of and from the Colorado River for use in the State of California. * * *

That means depletion.

Upper Colorado River Basin compact.

Executed October 11, 1948, and now ratified by all the upper basin States.

I might say that is the compact which Congress gave its consent to just a few days ago.

This compact establishes the rule for determining—

the quantity of the consumptive use of water * * *

Article VI provides:

The Commission shall determine the quantity of the consumptive use of water, which use is apportioned by article III hereof, for the upper basin and for each State of the upper basin by the inflow-outflow method in terms of man-made depletions of the virgin flow at Lee Ferry, unless the commission, by unanimous action, shall adopt a different method of determination.

The Supreme Court of the United States in the case of *Colorado* v.

Kansas, 320 U. S. 383; 88 L. ed. 116, adopts the same rule with respect to depletion. The question before the Supreme Court was the apportionment of water as between States. The waters of the Arkansas were involved and Kansas complained of increased diversions and uses in Colorado, but failed to show a depletion of the flow at the State line. The Court said:

> On its face this record would seem to indicate a large increase of consumptive use by Colorado. * * * When first turned in, the water is rapidly absorbed by the subsoil with consequent high consumption. By continued irrigation the subsoil becomes saturated, the water table rises, and water, in increasing quantities, flows back to the stream. Ultimately consumption falls well below diversion. The returned water again may be diverted and again supply return flows. Since the decision in the earlier case, studies of return flows have been made which indicate a steady reduction in the quantity of water consumed per acre of irrigated land.

The Court stated—

> * * * that, during the period, the river gains due to return flow have increased, the consumptive use of water has declined, and relatively the stream flows have improved.

Judge Stone discusses "Beneficial consumptive use," in the hearings on S. 1175, pages 519–520. I quote:

> It is contended by witnesses for California before this committee that beneficial consumptive use of water of the Gila River in Arizona is not measured by depletion of the virgin flow of the river at its confluence with the Colorado River, but is equal to the various increments of consumptive use at the points of use. If this principle is valid, it could be contended by California that it applied to the upper basin.

And Judge Stone said:

> It will be noted that in specifying the measure of beneficial consumptive use of the water apportioned by the compact to the upper basin, depletion at Lee Ferry was used. It cannot be assumed that a measure of beneficial consumptive use would be used for the upper basin differently from that for a large tributary of a river, such as the Gila. The use of the phrase, we believe, would be applied consistently throughout the compact.

And Judge Stone continues:

> This conception of the reason for the use of the term "beneficial consumptive use" by the Colorado River compact, coupled with resort in the compact to "depletion" by article III as the measure of beneficial consumptive use in the upper basin, demonstrates that it is unjustified, unreasonable, and not in accordance with the compact to measure beneficial consumptive use of the Gila River in any manner other than by depletion at its mouth.

End of the quote from Judge Stone.

Inasmuch as depletion (man-made) is the recognized yardstick just how much does Arizona deplete the Gila River? The Bureau of Reclamation estimates such depletion to be 1,135,000 acre-feet per year. (See p. R. 25, item 4, near top of page, "Central Arizona project report of December, 1947.) This consumptive use by Arizona is 135,000 acre-feet in excess of the 1,000,000 acre-feet apportioned to the lower basin by III (b) (Gila water) of the Santa Fe compact, and such 135,000 acre-feet should be deducted from the 2,800,000 acre-feet apportioned to Arizona out of III (a) water (main stream) pursuant to the Boulder Canyon Project Act, and the United States-Arizona agreement.

The question of evaporation loss and reservoirs is not mentioned in any way in the compact or in the various related instruments.

Reservoirs are built for the benefit and protection of the people in the area, flood control, to impound water to generate electric energy, to regulate the river, and for irrigation purposes. For instance, the Boulder Canyon Dam does all of these things. It serves as flood control for the Imperial district. It furnishes a source of cheap electric energy for southern California, and it, of course, regulates the river so that water is available for irrigation when the natural flow of the river is low. The upper basin States have recognized that in order to meet their obligation to the lower basin States and deliver 75,000,000 acre-feet of water during a 10-year period, reservoirs will have to be constructed in the upper basin, and the upper basin States agree that when these reservoirs are built, the evaporation losses will have to be borne by them. Beyond question, there will be other dams built in the lower basin, probably Bridge Canyon and Glenn Canyon. These dams will serve as silt-control, flood-control measures, but principally power development, and all of the lower basin area will benefit by this regulation. Arizona takes the position that when water is stored in on-stream reservoirs or off-stream reservoirs, that equity requires that all parties benefiting from such storage of water should bear ratably evaporation losses caused by such storage.

When I had finished contention two, which is the statement of theory, I decided that it would be appropriate to take the California text of just what they want to do, and by some practical illustrations and very few figures show that their theory of measuring by consumptive use is not proper, that Arizona's system of measuring by depletion is proper, and I also want to show by figures of the Bureau of Reclamation that California has made an error in computation of 1,700,000 acre-feet, which accounts for the difference between the two States of the available water under this contention two which I was just discussing.

We are now still talking and fighting about approximately 600,000 acre-feet of water in this issue.

The one issue which California stresses most is the issue of consumptive use versus depletion.

Mr. MURDOCK. Are you reading from the supplemental statement now?

Mr. KNAPP. Yes.

Mr. ENGLE. Mr. Chairman, may I interrupt at this point to say that I have to go to another committee. I would like to reserve the right to make a brief comment when I get back, and I will try to get back, with regard to Mr. Knapp's testimony, which is very interesting. If he is available, perhaps I may ask some questions. Would that be agreeable?

Mr. MURDOCK. That would be agreeable.

Mr. ENGLE. Thank you very much.

Mr. MURDOCK. Off the record.

(Discussion off the record.)

Mr. POULSON. I, also, want to go before this other committee, which, incidentally, pertains to this very same subject. I believe in that particular committee your Arizona advocates are attempting to slow the hearings down. In other words, they are not appearing and have not presented their testimony as yet, so I am going over to protest on that.

Mr. KNAPP. Do you want me to proceed, Mr. Chairman?

Mr. POULSON. Will Mr. Knapp be back at a later time?

Mr. MURDOCK. It is my understanding that Mr. Knapp will be here for due questioning.

Off the record.

(Discussion off the record.)

Mr. MURDOCK. Will you please proceed, Mr. Knapp?

Mr. KNAPP. California states the issue in Senate Joint Resolution 145, page 19, as follows:

> The first issue is whether the uses on the Gila River system chargeable to the lower basin and to Arizona shall be measured by the actual beneficial consumptive use of such waters, as California contends, or only by the amount by which its use would have depleted the flow of the Gila into the Colorado River. The difference in result between California's "consumptive use" theory and Arizona's present "depletion" theory is about 1,100,000 acre-feet.

That is approximately the figure I gave at the beginning.

The words "consumptive use" as used in the Colorado River compact, Boulder Canyon Project Act, and California Limitation Act is defined by the use of the following words "diversions less returns to the river." When you analyze that definition of consumptive use it means the same thing as the actual depletion. For example, if 100 acre-feet of water was diverted and placed upon land of which 50 acre-feet seeped or flowed back into the Gila River, it is clear that the amount of consumptive use as well as the amount which the Gila River would be depleted is the same, or 50 acre-feet. This is in agreement with the report of Mr. Delph Carpenter, of Colorado, which is referred to in the presentation by California, Senate Joint Resolution 145, page 22, when Mr. Carpenter's report stated:

> The term "beneficial consumptive use" is to be distinguished from the amounts diverted from the river. It means the amount of water consumed and lost to the river during use of water diverted. Generally speaking it is the difference between the aggregate diverted and the aggregate return flow. It is the net loss occurring during beneficial use.

And Mr. Carpenter's report further stated:

> The measure of the apportionment is the amount of water lost to the river. The beneficial consumptive use refers to the amount of water exhausted or lost to the stream in the process of making all beneficial uses. As recently defined by Director Davis of the United States Reclamation Service, it is the "diversion minus the return flow" (Congressional Record, January 31, 1923, p. 2815).

When analyzed there is, in reality, no difference between consumptive use and depletion as used by the compact framers and Congress for the purpose of determining the amount of water used. The only real question which is involved in the controversy between consumptive use and depletion is how and the place where the amount of consumptive use or depletion shall be measured. The compact framers made it clear in the Colorado River compact that depletion as between the upper and lower basins would be measured at the nearest border line dividing the two basis, to wit, Lee Ferry, and the United States Supreme Court in the case of *Colorado* v. *Kansas* (320 U. S. 383; 88 L. ed. 116), made it clear that the State line should be the determining point as between States, and the treaty between the United States and Mexico placed the point at the international boundary, so it should be clear that the point or place of determining the consumptive use or depletion of water of the Gila River in Arizona should be at the nearest

point to the Arizona-California State line, which would be at Dome just above the confluence of the Gila with the Colorado.

One should have a clear picture of what constitutes the Colorado River Basin as referred to in the compact. It consists of 204,000 square miles of which 103,000 square miles lie in Arizona and only 4,000 square miles in California. A look at the map will show the large number of tributaries, both small and large, which have built up the Colorado River, beginning up in Wyoming, Colorado, Utah, New Mexico, Arizona, and even Nevada. California is the only one of the seven basin States that contributes no water to the Colorado River. Nature ordained it that way. So when we talk about the consumptive use or depletion of the Colorado River we are referring, also, to the consumptive use and depletion of the tributaries that flow into it, such as the Gila River whose waters are used entirely within Arizona. Nature, again by a strange twist, ordained that no State other than Arizona may use the waters of the Gila River except an insignificant use at the point of its origin in New Mexico, as the Gila River flows into the Colorado River just above the Gulf of California in Mexico and below any point where its waters would have been or ever will be used in California.

During the negotiating of the Colorado River compact frequent reference was made to the "reconstruction" of the Colorado River. Secretary Hoover mentioned it several times and what the commissioners were trying to determine was the virgin or natural flow. The commissioners recognized that that must be the starting point in order to properly determine consumptive use or depletion. The reason is clear because it would be very unfair to any of the basin States to otherwise penalize a State because of the construction of storage dams. Such storage dams conserve and salvage floodwaters that would otherwise be lost and, as to the Gila, would waste into the Gulf of California. So the measure of consumptive use or depletion is based upon the natural condition of the river as it existed before the construction of any such storage or salvage dams.

Therefore, the first question to be answered is, What was the virgin or natural flow of the Gila River at its confluence with the Colorado River?

I believe that we can be agreed that the Bureau of Reclamation has proven its efficiency and accuracy over the many years, and has contributed materially toward the development of the West. That Bureau has made exhaustive studies of the Gila River and the uses of its waters. Where could we better turn to determine the natural or virgin flow of the Gila? I refer you to the Bureau's comprehensive and exhaustive report on the Colorado River of March 1946, pages 284–285. There appears a table for the years 1897 to 1943, inclusive. The Bureau summarizes in these words:

> For the purpose of this study the average virgin flow at the mouth of the Gila River has been rounded to 1,270,000 acre-feet annually.

Now, how much do Arizona's uses (man-made) deplete that natural or virgin flow of 1,270,000 acre-feet? Again, the Bureau answers the question. See Report on Central Arizona Project of December 1947, page R–25. The Bureau states the amount of depletion to be 1,135,000 acre-feet. That is the amount that Arizona is willing to

91190—49—ser. 11, pt. 1——12

be charged with. It is 135,000 acre-feet in excess of the 1,000,000 acre-feet apportioned by the Santa Fe compact by article III (b) in recognition of Arizona's uses of the Gila. Arizona is willing to have that excess of 135,000 acre-feet deducted from the 2,800,000 acre-feet allotted to Arizona by Congress by the Boulder Canyon Project Act.

California contends that Arizona should be charged with a greater amount of water than the depletion of 1,135,000 acre-feet as determined by the Bureau of Reclamation. And here is the crux of the whole controversy over the waters of the Gila River, involved in this contention 2. How much more water does California claim that Arizona should be charged with over and above the said 1,135,000 acre-feet? California states as follows:

> In the comments of the State of Colorado, hereinbefore referred to, the figure of 2,279,000 acre-feet is used as the inflow to the Phoenix area, all of which is beneficially consumed. Rounding the figure to 2,300,000 acre-feet, the difference between the depletion theory advanced by Arizona and the compact measure of beneficial consumptive use amounts to approximately 1,000,000 acre-feet.

(See hearings, S. 1175, p. 326, 80th Cong.)

We are now arguing about 1,000,000 acre-feet—I think California first contended it was 1,100,000 acre-feet—and, again, I direct your attention to the fact that we are talking about the amount of depletion through consumptive uses of the virgin or natural flow of the Gila River at the mouth. California bases here claim upon the figure of 2,279,000 acre-feet, which is obtained from the Bureau of Reclamation (Report the Colorado River, March 1946, pp. 284–285). Column 4 of the table on those pages shows "total natural inflow to Phoenix area, 2,279,000 acre-feet," but California fails to refer to or account for the natural loss of water between the Phoenix area, and the mouth of the Gila. Columns 5 and 7 of said table show those natural losses (not man-made) as follows:

	Acre-feet
Column 5. Natural loss in Phoenix area	527,000
Column 7. Natural loss from Gillespie Dam to Gila River at mouth	480,000
Total loss	1,007,000

To which I referred at the beginning of the discussion. Such water would never have reached the Colorado; the losses were not man made; and certainly were not beneficially consumptively used. They were losses due to evaporation, seepage, transpiration, et cetera, and certainly not chargeable to Arizona. California is, therefore, definitely wrong when it claims that the 2,279,000 acre-feet of inflow to the Phoenix area "is beneficially consumed," as 1,007,000 is lost. So, there lies the difference between California and Arizona over the consumptive use and depletion of the Gila. It accounts for and wholly wipes out the imaginary 1,000,000 acre-feet which California attempted to build up as surplus water that she might benefit. But, even more important, it destroys her argument that Arizona's present uses do not leave sufficient water necessary for the development of the Central Arizona project.

The figures of the Bureau above quoted, prove themselves. We still refer to the virgin or natural flow, as follows:

	Acre-feet
California's figures: Inflow to Phoenix area	2,279,000
Bureau's figures: Losses to Gila mouth	1,007,000
Natural flow at Gila mouth	1,272,000

which is the amount of acre-feet of virgin flow water as determined by the Bureau. The argument or controversy regarding the Gila waters is really one between California and the Bureau of Reclamation. Arizona has confidence in the accuracy and reliability of the studies and figures of the Bureau.

California, again, falls into error, when she contends that Arizona should be charged with all water "diverted, used and reused," in measuring consumptive use. This is in conflict with the position taken by all of the upper basin States, as well as Arizona. It contradicts the statement of Delph Carpenter, of Colorado, one of the compact commissioners, and quoted and relied upon by California, when he defined beneficial consumptive use to be "the net loss occurring through beneficial use." There are thousands and thousands of consumptive uses along the Colorado, its tributaries, including the Gila, and most of them are relatively small. To repeat an example, a user may divert for use 500 acre-feet, of which 200 acre-feet seeps, drains, or flows back into the river, which results in a consumptive use of 300 acre-feet. But the 200 acre-feet which gets back into the river, or becomes a part of the underground water supply available for pumping, is picked up by another user, and part of the original water goes through the same and repeated processes and much is lost and never used. In other words, the water is reused and reused or lost, and California contends that the upper basin States and Arizona should be charged with all the reuses. But engineering science has found no way to accurately measure or even approximate the consumptive use and reuses in each instance of diversion. This was recognized by the compact framers and the basic reason for using depletion of the virgin or natural flow as the yardstick to measure and determine the total chargeable consumptive uses. Depletion of the Gila is properly determined at Dome, the nearest measuring station to the Arizona-California line.

California also contends that—

> the idea that the only measure is the depletion of the flow of the river arises out of the idea that salvaged water put to beneficial use is not chargeable as beneficial consumptive use under the Colorado River compact and we believe it is chargeable.

That is California speaking. (S. 1175, p. 327.)

Salvaged water results from construction of dams and reservoirs which are constructed to conserve and save the virgin or natural flow of waters, which, through floods or otherwise, in the case of the Gila, would be wasted into the Gulf of California. We have shown that in determining the consumptive uses as evidenced by depletion that we are measuring the virgin or natural flow, in its state of nature, and not waters salvaged and saved in reservoirs, and which would have wasted into the Gulf. Otherwise a State would be penalized for conserving water.

This was what Herbert Hoover had in mind when, during the Santa Fe compact meetings, he called for the "reconstruction" of the Colorado and its tributaries, so that the Commission would have

before it the natural state, or virgin flow, from which to determine consumptive uses, depletion, and apportionment, and not from salvaged waters.

And here again California, in her attempt to build up contentious points with the hope of extracting water from others that are legally entitled to it, finds herself arrayed against all the upper-basin States and Arizona. Mr. R. J. Tipton, a consulting engineer from Denver, Colo., expresses very clearly the position of the upper basin when he stated:

> When man entered the picture, built his ditches, and started to apply water to the land artificially, the consumption of river water by those lands may not have caused much more depletion of the stream than was taking place under virgin conditions. He was merely putting to beneficial use some of the water that was being dissipated by nature in the virgin state. The effect of man's activities in this case on valley-consumptive use and basin-consumptive use would be the extent to which he increased the depletion of the outflow from the valley and the outflow from the basin.
>
> The salvage of water in the upper basin by these processes after ultimate development has been made may be a substantial item. Testimony already before the committee indicates the item in the Gila River Basin amounts to some million acre-feet per annum. If California's theory were accepted, she would ask that all the small incremental items of consumptive use in the upper basin which occur on the farms and on the projects be added up and that this be considered the beneficial consumptive use that was apportioned to the upper basin under article III (a) of the Colorado River compact. By such process she would be charging the upper basin with natural losses which the upper basin will have salvaged. This salvaged water never did reach the lower basin and never could have reached the lower basin in the state of nature. Nevertheless California maintains that the equivalent of such salvage water shall flow past Lee Ferry in order to increase the amount of surplus or unapportioned water in the Colorado River Basin.

Thus, California, alone, of all the States, claims salvaged water is chargeable when put to beneficial use.

One is forced to admire the ability and ingenuity of the California representatives in their desperate attempt to build up plausible arguments. I intend that as a compliment because California is ably represented. The climax is probably reached when California, again the only one of all the States, asserts that she should not be charged with reservoir or river losses, due to evaporation, seepage, and so forth. The large loss is evaporation of Lake Mead, which is estimated somewhere between 600,000 and 900,000 acre-feet annually. Remember that the upper basin States have fulfilled their contract when they deliver at Lee Ferry 7,500,000 acre-feet of III (a) water for use in the lower basin. It then flows into Lake Mead, and Congress has apportioned the III (a) water as follows: To California, not to exceed 4,400,000 acre-feet; to Arizona, 2,800,000 acre-feet; to Nevada, 300,000 acre-feet.

Arizona and the United States, through Ickes, Secretary of the Interior, entered into a water contract February 9, 1944, under which Arizona's share of water is "subject to such reduction on account of evaporation, reservoir and river losses, as may be required to render this contract in conformity with said compact and said act" (referring to Santa Fe Compact and Boulder Canyon Act, sec. 7 (d)). Please note that the foregoing quoted words show that such losses are chargeable in conformity with the compact and act. If the compact and act applies in that respect to Arizona's water, it must also apply to California's water.

But it is interesting to note that California is not guaranteed a full 4,400,000 acre-feet of water, as many assume to be the case. Congress,

in the Boulder Canyon Project Act, provided in section 4 (a) that water diverted for use in California "shall not exceed" 4,400,000 acre-feet. Congress undoubtedly had in mind that there would be evaporation, reservoir and river losses.

There is irony in the situation. The sun which California has so extensively and successfully advertised, and which has been the great contributing factor in the growth and development of that Southwest empire, now presumes to evaporate a part of that 4,400,000 acre-feet. What is so sacred about California's water that the processes of nature should withhold its forces and attack and evaporate only those waters of the other six basin States? And California, with characteristic generosity, apparently would have Arizona not only assume its losses of about 300,000 acre-feet but also assume the loss resulting to California's water. The question answers itself.

The foregoing is a summary of the essential points relating to beneficial use, depletion, evaporation, river losses, and salvaged waters.

I submit to the committee that we have shown that the 600,000 or more acre-feet should not go to California but should go to Arizona by reason of the yardstick of depletion as against the system as proposed by California.

Now, as to contention 3, the California Water Limitation Act.

The above-named act was enacted by the California Legislature and became effective August 14, 1929. It was enacted pursuant to the mandate set forth in section 4 of the Boulder Canyon Project Act enacted by Congress and effective December 21, 1928, and copies the language of the congressional act. The pertinent part thereof is as follows:

> * * * The State of California, as of the date of such proclamation, agrees irrevocably and unconditionally with the United States and for the benefit of the States of Arizona, Colorado, Nevada, New Mexico, Utah, and Wyoming as an express covenant and in consideration of the passage of the said Boulder Canyon Project Act that the aggregate annual consumptive use (diversions less returns to the river) of water of and from the Colorado River for use in the State of California, including all uses under contracts made under the provisions of said Boulder Canyon Project Act, and all water necessary for the supply of any rights which may now exist, shall not exceed 4,400,000 acre-feet of the water apportioned to the lower basin States by paragraph (a) of article III of the said Colorado River compact, plus not more than one-half of any excess or surplus waters unapportioned by said compact, such uses always to be subject to the terms of said compact.

The California act is extremely important, as it expressly limits California to 4,400,000 acre-feet per annum of consumptive use out of the 7,500,000 acre-feet apportioned to the lower basin by III (a) of the compact. But such limitation also is subject to "all water necessary for the supply of any rights which may now exist." One of such existing rights is set forth in section 4 (a) of the Boulder Canyon Project Act, which provides "That the State of Arizona shall have the exclusive beneficial consumptive use of the Gila River and its tributaries within the boundaries of said State." And it was the recognition of Arizona's rights to the Gila that caused the compact commission to add III (b) providing for an additional apportionment to the lower basin of 1,000,000 acre-feet.

California is now attempting to establish uses to surplus waters, under what is known as the California System of Priorities. Those

self-asserted priorities now total 5,362,000 acre-feet, or 962,000 in excess of the 4,400,000 acre-feet to which it limited itself by law.

California entered into contracts in 1932 with the United States for water, but such contracts expressly provided that they are subject "to the availability thereof for use in California under the Colorado River compact and the Boulder Canyon Project Act." And the California Water Limitation Act provides that the amount of 4,400,000 includes "all uses under contracts made under the provisions of said Boulder Canyon Project Act." It is doubtful that California will seriously contend that it can assert any claim to any water in excess of 4,400,000 acre-feet, except to any surplus water to be apportioned after October 1, 1963.

Next is the Mexican treaty. The treaty between the United States and Mexico signed February 3, 1944, provides for an annual delivery to Mexico of 1,500,000 acre-feet, subject to certain conditions, and is not pertinent to the points hereinbefore made.

The conclusion: The central Arizona project is pending before the Congress. Hearings have been held, many witnesses have testified, and a very complete record has been made.

The record shows and the Bureau of Reclamation has found that the project is feasible and that water is available from the Colorado out of the share thereof to which Arizona is legally entitled. The project does not propose to bring additional lands into cultivation, but is necessary to prevent lands now under cultivation from returning to the desert.

Arizona has a legal right to 2,800,000 acre-feet from the Colorado, plus waters from the Gila to the extent of 1,000,000 acre-feet (III (b)), plus one-half of the surplus waters, subject to apportionment, after October 1, 1963.

Adding up your legal availability: Under contention one, III (b) water, there is 500,000; under contention two, 600,000; under evaporation loss, which California clearly could not charge against Arizona, 450,000. That would add up to a much larger total than is required to meet the needs of the central Arizona project.

Mr. Walter Bimson Saturday pointed out that each year something like 8,000,000 acre-feet is flowing into the Gulf of California, surplus water.

As a matter of fact, that surplus water will be flowing into the Gulf of California 50 years from now, and maybe a century from now; at least until the upper basin, by construction of dams and reservoirs, can reap a total use of that water so that no surplus flows down to the lower basin and into the Gulf.

We are talking here about a situation that will be really pertinent a half century from now, because for many years surplus waters will continue to flow into the Gulf.

I thank you gentlemen for your courtesy.

Mr. MURDOCK. Judge Knapp, I am not a lawyer, and for that reason I am not able to follow the close reasoning of your logical statement as well as some of my colleagues here who are lawyers can follow it. It was a good statement.

We have now, about half an hour which may safely be used for questioning. I had thought we would begin with the newer members.

Mr. Marshall, do you have some questions to ask?

Mr. MARSHALL. I have only one, I think, at this time.

I am a little bit confused as to Nevada's position in this difference of opinion between Arizona and California. I notice that they have, as a lower basin State, 300,000 acre-feet. What is Nevada's position?

Mr. KNAPP. Nevada, essentially, of course, is not really interested in the water problem which is before this committee. Their primary interest lies in power, and the very small amount of water that they get, recognizing the fact that Nevada is not in a position to utilize and use much water, is not too much of a problem in connection with this. So far as legal rights are concerned, Nevada, of course, has all the legal rights, whatever they may be, of California and Arizona.

Mr. MARSHALL. There is not any attempt on the part of anybody to break agreements formally entered into, as far as this compact is concerned? It is a matter of a difference of opinion or understanding as to what some of the terms of that original compact were, is that right?

Mr. KNAPP. Yes; I think that may be true.

You speak about Nevada. I do not know the attitude of California with reference to Nevada, and the evaporation losses, or whether she would want to transfer some of her burden of evaporation loss to Nevada, as well as to Arizona. They can answer that when they appear.

Mr. MARSHALL. It is not so much a problem of diverting the water for irrigation purposes as it is for the interference with water that might be used for power purposes. That does not enter into the picture so much, does it?

Mr. KNAPP. The diversion of water into Nevada, I would naturally assume, would be above Boulder Dam, in a very small amount. Of course, it is the water that goes through Boulder Dam that generates the power that Nevada is interested in.

Mr. MARSHALL. Thank you.

Mr. MURDOCK. Senator McFarland, who was here during most of the hearings, had to leave.

My colleague, Congressman Patten is here, but he presumably is debarred as I am.

If the committee will permit, I will go now to Judge Bosone, who is a lawyer.

Mrs. BOSONE. Mr. Chairman, I regret to say that unfortunately I was unable to attend the hearings last week and, of course, I have not had an opportunity to even read H. R. 934. I gather, however, from Mr. Knapp's statement, that Arizona's case is resting upon the facts and the interpretation of those facts from the very history of the compact, dating to 1932, and also on the physical conditions in Arizona?

Mr. KNAPP. I think that is true.

Mrs. BOSONE. You are resting your case upon those facts?

Mr. KNAPP. I think that would be correct.

Mrs. BOSONE. That is clear to me, but I have not heard the other side. I will be very much interested in those hearings which I missed last week, and the statement of Congressman Engle.

Mr. MURDOCK. Mr. Poulson?

Mr. POULSON. Mr. Knapp came here with a reputation of being one

of the best lawyers in the Southwest, and he has ably demonstrated that reputation with which he came here. I think he has ably presented his interpretation and the interpretation of other people from Arizona as to what they think is the interpretation of the compact.

However, as a lawyer, is it not true that you will admit that lawsuits are based upon the conflicting interpretation of documents?

Mr. KNAPP. That is right.

Mr. POULSON. As a lawyer, you accept the principle that another lawyer may disagree with you. I am not speaking as a lawyer.

Mr. KNAPP. That frequently happens.

Mr. POULSON. Of course, is it not the province of the courts to reconcile the differences between attorneys on interpretation?

Mr. KNAPP. That is right.

Mr. POULSON. On the dispute between two States, that interpretation or that decision generally rests within the Supreme Court, is that not true?

Mr. KNAPP. The United States Supreme Court; yes.

Mr. POULSON. Now, Mr. Knapp, I am not going to try to question you on these legal interpretations. I think that Jurge Bosone very ably stated the case and that we must hear from both sides.

Certainly, on the California side we will have our attorneys present our interpretation of the compact and of the other cases which have hinged upon this interpretation.

I would like to say this: The Department of the Interior recognizes that there is a dispute.

Mr. KNAPP. I think everyone recognizes, Mr. Poulson, that there is a difference of opinion and a dispute between the two States.

Mr. POULSON. Would it be in line, Mr. Chairman, inasmuch as I personally am not able to go into this, to make an offer of the proper questions to his statement—which has been a very lengthy and comprehensive statement, for I think he has covered about everything that could be stated from his standpoint—at a later time for my colleague Mr. Engle and me to have a chance to propound some questions for Mr. Knapp?

We realize that he has come a long ways, and we do not want to delay the hearing to that extent, but I think he has demonstrated the fact that he is one of the able advocates from the legal standpoint, and, therefore, I think we should direct our questions to Mr. Knapp. We would like to have a chance to do so.

Mr. MURDOCK. I think we can arrange that. We will do our best to arrange it.

Mr. KNAPP. May I interrupt, Mr. Chairman, to say something?

Mr. MURDOCK. Yes, Mr. Knapp.

Mr. KNAPP. I have been here nearly 10 days. I came with the expectation of remaining 1 or 2 days. I have to get home. It was my intention, when I completed with the presentation today, to go down, get on the train, and depart.

I do not want to run away under fire. I was hoping that whatever questions any of you members of the committee wished to ask me could be asked now.

Mr. POULSON. Well, you probably realize that our representatives and legal staff will be answering your contentions in that respect.

Off the record.

(Discussion off the record.)

Mr. MURDOCK. Mr. Baring?

Mr. BARING. Mr. Chairman, in answer to Mr. Marshall's question, wherein Nevada entered into this picture, I would like to insert an observation right here:

As proposed in this bill, a million and a quarter acre-feet would ultimately bypass Boulder and Davis Dams, reducing the power Nevada is entitled to at such projects. More important, Bridge Canyon power itself would be loaded with over $300,000,000 of subsidy to an Arizona irrigation project. When the Boulder Canyon Project Act was debated, Nevada insisted that power at Boulder Dam should not have to pay for any part of the All-American Canal. The power users of Nevada are entitled to have the same principle apply to Bridge Canyon.

I just insert that as an observation at this time.

Mr. MURDOCK. Mr. D'Ewart.

Mr. D'EWART. I think Mr. Knapp has made a very able presentation here this morning.

I would like to suggest to the other members of the committee that in connection with Mr. Knapp's remarks they read the presentation which was made by Senator McFarland the other day, which I think will help very materially in understanding the presentation made this morning.

It will be well worth your time to read Senator McFarland's statement. It is long, but it is likely to help you in understanding this problem.

I have one question. The original compact, as I remember it, allotted you 1,000,000 acre-feet out of the Gila River. The determination by the Bureau of Reclamation that there was 1,270,000 acre-feet in the Gila River changed the amount. Is it your contention that that 270,000 acre-feet should be allotted to Arizona, or is it your contention that that should be considered as excess water under the compact?

Mr. KNAPP. I think your figure of 1,270,000 acre-feet was the average anual flow of the Gila over a period of years. I do not think that is the figure that would be taken into consideration to determine the excess of use by Arizona over that 1,000,000 acre-feet.

I think the figure that you would want would be the figure of depletion, which is 1,135,000 acre-feet. As I have stated in my remarks, that is excess over the 1,000,000 given to us, and we are perfectly willing to have that deducted.

Mr. D'EWART. That is contrary to the argument made by Senator McFarland. His argument said he believed that should be included in the allotted waters in the Gila River to Arizona. That is why I brought the point up.

Mr. KNAPP. When you get lawyers tossing figures around, maybe we become a little confused, although I think we are probably agreed in principle.

Mr. MURDOCK. Mr. Bentsen?

Mr. BENTSEN. I would like to make an off-the-record observation.

(Discussion off the record.)

Mr. MURDOCK. Mr. Barrett?

Mr. BARRETT. Mr. Knapp, I followed you very closely, and I think you made a very splendid presentation of the Arizona position.

There are a few little items that are ambiguous to me.

On page 7 of your original statement you list some questions and answers by Governor Campbell of Arizona.

Next to the bottom of the page I notice that the Governor states, and I quote:

> I assume these discussions would appear in the transcript of the minutes.

What I would like to know is this: Is there such a transcript?

Mr. KNAPP. I do not know that I can answer that with absolute accuracy, but I have been informed that they never have been able to locate the full and complete minutes. They did locate some of them.

There is such a transcript of the minutes in existence because there would have to be in order to get this testimony. Of course, this is not the only testimony of witnesses.

Mr. BARRETT. This is not that testimony. This testimony was before a Senate committee, as I understand it.

Mr. KNAPP. I see what you mean. Pardon me.

Mr. BARRETT. I am not speaking about the testimony before the Senate committee.

Mr. KNAPP. My part of the answer in which I refer to the inability to locate all the minutes of the Santa Fe compact meeting is correct. I do not believe they have been able to locate all of them.

Mr. BARRETT. Are there any minutes available that substantiate your position?

Mr. KNAPP. I do not know.

Mr. BARRETT. As a result of the compact of 1922 in Santa Fe certainly the commissioners made reports to their various States. Are those reports available and do they substantiate your position?

Mr. KNAPP. I have never seen them and I cannot answer that question, though perhaps someone else who follows me can.

Mr. BARRETT. If you will turn over to page 12 of your original statement, I note there that in construing the statement of that section of the act you say:

> It will be noted that Congress apportions 7,500,000 acre-feet annually to Arizona, California, and Nevada out of the main stream (III) (a), of which 2,800,000 is apportioned to Arizona), plus one-half of excess or surplus waters, and in addition thereto the "exclusive beneficial consumptive use of the Gila River and its tributaries—"

However, in reading the act, subsection 3, it does not refer to it as an addition. I wonder why that was not spelled out there at that time.

Mr. KNAPP. I am looking at section 4 (a) of the act. I do not believe I can answer your question. I think it is correctly copied from the act.

Mr. BARRETT. It seems to me that it is very unfortunate that many of these disputed points were not covered and spelled out in plain language. I am inclined to believe that certainly the waters under III (b) were apportioned. Why did they not say that they were apportioned to the State of Arizona instead of to the lower basin? That is the thing that has been bothering me a little bit.

Mr. KNAPP. Well, I can only speak outside of the record. There was a feeling, I think, at the time that if they picked out one river of the entire Colorado River system, like Gila, and named it, they would

fall into the difficulty of the members of the Commission wanting some others to be specially referred to.

I think, also, that had the Santa Fe Commission for one moment thought that the lower basin would have difficulty in arriving at an agreement that they would have given us something much more clear, and a better guide for action today.

Mr. BARRETT. Can you tell me if an exhaustive search has been made by your State to find some documentary evidence at the time of the minutes of the Santa Fe meeting, and the discussions and reports of the various States; and that you are unable to get them; and that we are now required to rely entirely upon statements of commissioners and representatives who were present and who testified from memory as to what took place?

Mr. KNAPP. I think that question can be answered by Mr. Charles Carson, who is the attorney for the State of Arizona and Interstate Stream Commission.

You understand, I do not represent the State of Arizona, nor any group. I was invited to come here. In fact, I was asked to help out. My service is purely voluntary.

I have not ever had occasion to look for the records to which you refer. I am sure Mr. Carson can answer your question.

Mr. MURDOCK. I personally know a search has been made for the transcript of the Santa Fe meeting without success.

Mr. BARRETT. Just one other question. On page 7 of your supplemental statement I notice you refer to a natural loss of the Gillespie Dam.

If I followed you closely, California contends that there is some 2,279,000 acre-feet inflow of water that they want to charge to Arizona. You contend that the Gila River is depleted at the State line, Dome, about 135,000 acre-feet over the 1,000,000?

Mr. KNAPP. That is correct.

Mr. BARRETT. That is your portion under the compact. What is this Gillespie Dam situation? What does that amount to? I do not quite understand it.

Mr. KNAPP. I am not an engineer The engineers can answer those questions as to those natural losses much better than I can. All I did was to take those figures and those words from the report of the Bureau of Reclamation which appears in the——

Mr. BARRETT. What is the Gillespie Dam?

Mr. KNAPP. The Gillespie Dam is a dam that is some distance below Phoenix for the purpose of diversion and accumulating water. I presume the Bureau, instead of saying that the loss between the Phoenix area and the Colorado River is 1,700,000 broke it into those two areas, because the Gillespie Dam was in between.

The engineers who will follow me will have to answer that question.

Mr. BARRETT. Thank you very much.

Mr. MURDOCK. Mr. Regan?

Mr. REGAN. No questions, Mr. Chairman.

Mr. MURDOCK. Mr. Lemke?

Mr. LEMKE. I have one or two questions.

First I want to compliment you for your able presentation of this case.

Mr. KNAPP. Thank you, sir.

Mr. LEMKE. I would suggest, if anything, that you spent a little too much time on the problem of consumptive use. I think common sense would tell us what that is.

The question I want to ask you first is on page 4 (b).

In addition to the apportionment in paragraph (a), the lower basin is hereby given the right to increase its beneficial consumptive use of such waters by one million acre-feet per annum.

There is nothing there that says Arizona is entitled to that. The Supreme Court, on page 16, says that it belongs to the three of them. Do I understand you right there?

Mr. KNAPP. Belongs to whom?

Mr. LEMKE. To the three States.

Mr. KNAPP. To the lower basin; yes.

Mr. LEMKE. To the lower basin. You claim it all belongs to Arizona, all of the waters in the Gila River. In the face of that decision and in the face of the rule that you cannot use outside evidence to add to or take from an existing contract, unless it is ambiguous, would you say that that first paragraph (b) is ambiguous and, therefore, you can take outside evidence? To me Hoover's letter, which is very conclusive in my mind, if it is permissible, is outside evidence. If it is ambiguous you can do that. As a lawyer would you say it is ambiguous?

Mr. KNAPP. I was just considering that particular phase of it. Apparently it is ambiguous because the question has arisen as to just exactly what was meant. The paragraph (b) could have been more clear if it had said, "There is hereby apportioned 1,000,000 acre-feet."

Mr. LEMKE. They should have said, "to Arizona" to have made it clear.

Mr. KNAPP. Yes, but there again, in answer to the Congressman's question, it is my understanding that they did not want to bring in any one river by reference. They could have said, and I believe they would have said——

Mr. LEMKE. As a lawyer, would you say under those conditions it is admissible evidence because you did not do it but you should have done it, but you did not do it for some other reason?

Mr. KNAPP. I was not arguing with this committee as to the legal phase of it so much as to develop the actual fact that it was the intent of the Santa Fe Compact Commission that that 1,000,000 acre-feet was in recognition of the uses of the waters of the Gila.

Now, you could not have given those waters to California because Arizona is the only State that could use the waters of the Gila River, the only State that ever has.

Of course, the compact followed by the Boulder Canyon Project Act made it clear that California was not participating directly in that 1,000,000 acre-feet because California is limited to not to exceed 4,400,000 acre-feet from the main-stream waters. They just let her take her proportion out of the main-stream waters.

Mr. LEMKE. Yet you have the decision of the Supreme Court that it belongs to all three.

Mr. KNAPP. But the physical factor, of course, is that while that may be true the only State that could make any use of it was Arizona.

Mr. LEMKE. Let me ask you a further question: If the Supreme Court continues in that position, can this Congress do anything else?

If that is the compact and that was understood, and it belongs to the three States equally, can we do anything else?

Mr. KNAPP. Of course, I do not know that the matter is going to the Supreme Court at all, or what their decision would be, Mr. Lemke, so I do not know to what extent the Congress would be bound.

Mr. LEMKE. I would say it may be entirely different from this court, from what it was in the former court.

Mr. KNAPP. That may be.

Mr. LEMKE. Let me ask you this: Why should Arizona attempt to delay? It seems to me that if I were in your position, with your brief, I certainly would want to get into that court as quickly as the law would let me.

Mr. KNAPP. On the question of delay——

Mr. LEMKE. I am taking for granted that is what you are doing, because it has been suggested here so often that Arizona was trying to prevent that case from coming into court.

Mr. KNAPP. I think that Arizona's viewpoint is that California is the one who is delaying, trying to create a delay. These water cases, even between a couple of States, like Kansas and Colorado, extend over periods of 25 years, 11 years, 15 years, and so forth.

Just how long it would take to unravel a case where seven of the States are involved is rather staggering.

I think a gentleman the other day asked, "Has not Arizona done anything?"

Arizona, of course, has been in the Supreme Court three times, in 1930, 1934, and 1936, under various cases, but never successfully.

The upper basin, as a matter of fact, as well as Arizona, is merely raising the question before Congress as to whether or not this resolution which California has introduced to put this case in the Supreme Court is such that Congress can enlarge the jurisdiction of the Supreme Court in any way. The Supreme Court itself has insisted upon a justiciable controversy existing before it would take jurisdiction between two States. The question is whether there is a justiciable controversy existing now, because they would have to allege and show an immediate injury or a definitely threatened injury or damage.

Right at the present time California's 4,400,000 acre-feet are not endangered. They are only using 3,300,000, and they are pouring 1,000,000 acre-feet, we say, into the Salton Sea, and a lot of water is going into the gulf.

There is a question under the decision of the Supreme Court whether they would take jurisdiction unless, perhaps, Congress passed this Central Arizona Project Act, which might be held to constitute a threatened damage.

Mr. LEMKE. May I ask another question right there? In your supplementary brief you say you are willing to concede one-million-some-hundred-thousand acre-feet to California on the Gila River. I understand you are not willing to do that, but say it all belongs to Arizona.

Mr. KNAPP. You may have misunderstood me, Mr. Lemke.

Mr. LEMKE. Just for the sake of that argument, you were willing to concede it?

Mr. KNAPP. What I was contending was that under the beneficial consumptive-use argument we would accept the Bureau's figures of

depletion amounting to 1,135,000. California said we should be charged with 2,300,000.

Mr. LEMKE. Your argument was to that point alone, then?

Mr. KNAPP. Yes, sir.

Mr. LEMKE. That is all, Mr. Chairman.

Mr. MURDOCK. Mr. Regan, do you have a question?

Mr. REGAN. Yes; following Mr. Lemke's discussion of this Gila River, which I previously thought I had pretty well straightened out. That was why I did not ask any questions.

The Gila River is strictly an Arizona stream, so far as the lower basin is concerned? There is not any part of the 7,500,000 acre-feet of water that comes by Lee Ferry that is from the Gila, in that apportionment of 4,400,000, 300,000, and 2,800,000 acre-feet?

Mr. KNAPP. You are correct.

Mr. REGAN. The waters of the Gila River are no part of that allocation of water?

Mr. KNAPP. You are correct.

Mr. REGAN. The reason it is in the compact is the fact that it does ultimately flow into the Colorado River?

Mr. KNAPP. Yes.

Mr. REGAN. It is below a point where California could receive any beneficial use of the water of the Gila River?

Mr. KNAPP. That is correct.

Mr. REGAN. Outside of the fact that it is a part of the basin, it really should not be a part of the controversy, other than the fact that we owe a certain amount of water to Mexico in the treaty; is that right?

Mr. KNAPP. That is right.

Mr. REGAN. So, instead of using 1,000,000 acre-feet of water of the Gila, you are using 1,135,000 acre-feet. While California could have no beneficial use of that 135,000 acre-feet, you are willing to be charged with that because it is water that belongs to the Gulf of California which might go under the Mexican Treaty; is that right?

Mr. KNAPP. That is a correct statement.

Mr. REGAN. Thank you, Judge.

Mr. MURDOCK. Mr. Morris?

Mr. MORRIS. Where does the Gila River begin? Where does it end? What territory does it traverse?

Mr. KNAPP. It has its origin up in New Mexico, just a short distance over the Arizona-New Mexico State line. It flows down through Arizona and enters the Colorado River just a little distance above Yuma and a short distance above the Gulf of California.

Mr. MORRIS. In other words, it flows only in two States, is that correct—New Mexico and Arizona?

Mr. KNAPP. Yes. It is very little in New Mexico. I think it would be fair to say it has its origin there, but there is very little water coming into Arizona.

Mr. MORRIS. It flows through no other States at all, except those two?

Mr. KNAPP. You are correct.

Mr. MORRIS. New Mexico and Arizona?

Mr. KNAPP. You are correct.

Mr. MORRIS. It is almost entirely all in Arizona?

Mr. KNAPP. That would be correct.

Mr. MORRIS. There is a little in New Mexico. It heads in New Mexico up in the mountains, I assume?

Mr. KNAPP. That is correct.

Mr. MORRIS. It starts as a very small stream and gets larger as it goes down?

Mr. KNAPP. Yes, sir.

Mr. MORRIS. I have this other question: You say in your concluding paragraph, which is short and which I will read:

> Arizona has a legal right to 2,800,000 acre-feet from the Colorado, plus waters from the Gila to the extent of 1,000,000 acre-feet, plus one-half of the surplus waters, subject to apportionment, after October 1, 1963.

Now, if that be true—will that definitely, in your judgment, make the central Arizona project entirely feasible from every standpoint?

Mr. KNAPP. Without hesitation, I would say "Yes"; but I am not an engineer, and a legal opinion would perhaps not be helpful. In making that answer definitely and positively "Yes," I base it upon the fact that we are entitled to the water that we have been talking about this morning.

With those amounts, there would be an excess, and easily plenty of water.

Mr. MORRIS. I have this third question, and then I will conclude: Do you consider a resolving of this 1,000,000 acre-feet question between you and California to be the main question to be solved between the two States?

Mr. KNAPP. It is difficult to say whether it would be the main question. The first question is whether the 1,000,000 acre-feet in recognition of the Gila River is surplus or apportioned water.

Mr. MORRIS. Yes; that is the question. If that question is resolved in favor of Arizona, we will say——

Mr. KNAPP. I think that is one of the main questions. I think, without any doubt, that the record shows conclusively that it is apportioned water.

Mr. MORRIS. To Arizona?

Mr. KNAPP. Yes.

Mr. MORRIS. I followed you carefully on that. I am not saying you are right or wrong about it, of course.

I wont to compliment you upon your very splendid presentation.

What I was trying to get clear in my own mind were the chief contentions. I did not know whether you considered that particular phase to be the chief contention, or whether you thought some other matter would be the chief contention between the two States.

Mr. KNAPP. I think that the other ones are of equal importance, of course.

Mr. MORRIS. I see. Thank you very much.

Mr. MURDOCK. Governor Miles?

Mr. MILES. Mr. Chairman, as you stated a while ago, I am not a lawyer and engineer. Sometimes it is difficult for me to follow the testimony with any degree of understanding.

Mr. Knapp, I want to say to you that I feel that your clear and practical and understandable language, which you presented to this committee, almost made it understandable for me.

Mr. KNAPP. Thank you, sir.

Mr. MILES. In view of that fact, and in view of the fact that you,

as I understand the testimony, attended the compact in Santa Fe, I want to ask you this question: Outside of providing a place to hold the hearings, what other benefit did New Mexico derive from that compact?

Mr. KNAPP. Well, you place me in a rather difficult position. We enjoyed our stay up there very much. It was a beautiful setting in which to consider this important problem, and I have always enjoyed going back there.

Mr. MILES. With more direct reference to the Gila River water, I remember that we have been in the court in New Mexico on this water. My first official act, after I was sworn in as Governor of New Mexico, was to send an officer down there to knock the lock out of the headwaters and let them flow out over that drought-stricken area of the Verde Valley in New Mexico. We were in contempt of court; and after paying a $300,000 fine we were still in court, and I am afraid still in contempt.

Mr. KNAPP. I think that was in the United States district court in Tucson, Governor.

Mr. MURDOCK. May I add just one serious thought.

You thought so well of Santa Fe, N. Mex., from the hearings in 1922, that all those who participated went back for the next big move there in October of 1948; did they not?

Mr. KNAPP. That is right.

Mr. MURDOCK. So that they might conclude their deliberations on the Upper-Basin compact in the same historic setting.

Mr. MILES. Mr. Chairman, I will say this: If we could reverse that and receive a little more benefit from the water, we will let some other place hold the hearings.

Mr. MURDOCK. That is quite understandable, Governor.

Let the committee recall that we have an important bill on the floor of the House. I will not detain the committee longer.

Thank you, Mr. Knapp.

We shall adjourn until 10 o'clock tomorrow morning.

(Thereupon, at 12:15 p. m. Monday, April 4, 1949, an adjournment was taken until 10 a. m. Tuesday, April 5, 1949.)

THE CENTRAL ARIZONA PROJECT

TUESDAY, APRIL 5, 1949

HOUSE OF REPRESENTATIVES,
SUBCOMMITTEE ON IRRIGATION AND RECLAMATION
OF THE COMMITTEE ON PUBLIC LANDS,
Washington, D. C.

The subcommittee met, pursuant to adjournment, at 10 a. m., in the committee room of the House Committee on Public Lands, New House Office Building, the Honorable John R. Murdock (chairman of the subcommittee) presiding.

Mr. MURDOCK. The subcommittee will please come to order.

We will proceed with our hearings on H. R. 934 and H. R. 935.

We have this morning two witnesses from the Indian reservation interested in the legislation.

We will be glad now to hear from David A. Johnson first.

STATEMENT OF DAVID A. JOHNSON, SR., BAPCHULE, ARIZ.

Mr. JOHNSON. Mr. Chairman and gentlemen of the committee, my name is David A. Johnson, Sr. I am a full-blooded Pima Indian, born on the Gila River Indian Reservation in southern Arizona, as was my father and his father, and so on back through many generations. I do not know how long my people have lived on the lands we now occupy, but our legends tell us that we were there many centuries before the white man came.

I am the chairman of our tribal council, also chairman of our Indian irrigation committee, and I have been selected to appear before this committee as a representative of the Pima Tribe to tell you of their need of more water.

The Pima Reservation was set aside by act of Congress in 1859, and through subsequent acts increased to approximately, 372,000 acres. There are 50,000 acres included in the Indian portion of the San Carlos project, of which 10,000 acres still are undeveloped. There is another 10,000 acres of land outside the San Carlos project, being irrigated from pumps and waste water from the Salt River project. The supply, however, is insufficient and high in salt content.

The first census was taken in 1858 and gave the number of our tribe as being 4,635. The present number is about 5,365. There are approximately 1,170 farm units in the Indian part of the San Carlos project varying in size from 10 to 80 acres. The larger acreage is possible only by leasing among ourselves, as we are allotted only 10 acres of irrigable land.

There are no large holdings on our reservation, but total amount of

farm products and livestock produced on the project in 1947 had a cash value of $677,598. In 1948 it was only $511,551. This reduction was because of the continued falling off of our water supply.

In view of the allotment of only 10 acres, many farms are still operated as subsistence farms; but, by leasing among ourselves, some of the Indians try to farm enough land to adopt the white man's civilization and farm on a commercial basis.

According to archeologists, our irrigation project is the oldest in America. They show that some of our lands have been under irrigation for nearly 14 centuries.

Before the Christian era, our race of people living along the Gila River was called Ho-Ho-Kam, which translated into your language means "disappeared," "gone," "departed." About 600 A. D., the Ho-Ho-Kam had progressed in their primitive civilization when they had learned to divert water from the Gila River onto desert land and produced crops of corn, squash, and beans. Some of these old canals which they built have been excavated, and it was found that some were as much as 10 feet deep and 20 feet wide. These canals were dug with stone tools and the earth carried out in large baskets, because at that time there were no axes, shovels, or horses as we have today.

Along about 1690 the great Father Eusebio Francisco Kino, a Spanish priest from Mexico, began to build his chain of missions, "visitas" in our country. Our State was given the name of Pimeria Alta which included San Xavier (Tucson). Father Kino found a small flow of water and cultivated fields which the Indians called Ari-zon-ac or Ahl-zon-ac, meaning "The Place of Small Water"—in other words, a small spring. Our Arizona has probably established its name since. My ancestors, as Father Kino described them, were "peaceful farmers," subsisting themselves by means of irrigated agriculture. They had rehabilitated some of the canals of our old Ho-Ho-Kam and built others of their own and were able adequately to live and subsist as long as there was water flowing in the Gila River.

Before Father Kino's death in 1711, he helped the Indians by supplying them with livestock and farm seeds. For a period of more than 100 years very few white men came into the Pima country. Our country was under Spanish control during this period but passed to Mexican control. Not until 1846 did we have any contact with the Federal Government, and some time later John Walker was the first Indian agent stationed at Tucson. In that year of 1846, Captain Kearney, at the outbreak of the Mexican war, led an expedition into our country. Our Indian ancestors were able to furnish Captain Kearney and his soldiers food, and feed for their horses.

The first continental stage line was definitely established across the Southwest near the thirty-second parallel and was the wagon route to California. It passed through our villages because we gave not only food but protection to immigrants who came our way.

During the Civil War we sold thousands of bushels of wheat to the Union Army, wheat from seed which Father Kino had brought to us more than a century before. Not only was this assistance given from our Indian ancestors, but our people also formed the first Company C, Arizona Volunteers in our State to wear the uniform of the American Army.

It was a pity to note in the history of a deserving people after the Civil War that many white people began to settle above, or east of us, and practiced our way of farming by diverting water from the Gila stream. Severe hardships from malnutrition and many deaths occurred because of shortage of water with which to irrigate our lands. Suffering lasted more than 40 years. Finally, outside work was looked for and gleanings were made at harvest time in the fields of neighboring white people. Firewood was cut and sold for a livelihood.

Some time after 1900, when both the Gila River Dam at San Carlos and the Salt River Dam at Roosevelt were being discussed, my people believed that our desperate condition would be relieved from one or other of the dams that were to be constructed. This was not the case, however, and the selection of Roosevelt rather than the San Carlos location left us without water for another twenty-odd years.

Finally, in 1928, the Coolidge Dam was built to impound 1,200,000 acre-feet, or so it was intended. But for the last several years the run-off has been far below—or nothing. The storage was very low in 1947, and in 1948 there was nothing.

Our present supplementary water supply is underground water pumped from irrigation wells on our reservation. It is our only source. When the people to the south and east of us pump and pump it diminishes our underground water supply and if it fails, we, no doubt, will be in the same condition as the Ho-Ho-Kam.

We want this Government to make this right by supplying us extra water from the Colorado River. Our lands are our only resources and without water we cannot live. We have no other means, no black gold, no wood gold—our wood is gone—no industries, but green gold if there is water.

We are still farmers like Father Kino found us more than three centuries ago. We are joining with the Central Arizona Project Association in presenting our plea for building this gigantic venture because we believe our future would be assured. We believe this project is a dependable source from which water can be obtained and from which Arizona's irrigated lands will benefit.

We believe, also, that in endorsing this proposal to bring Colorado River water to the Indians, the white man will enjoy the satisfaction of knowing he is making amends to the Indians by replacing to them the waters of the Gila River which the Indians have always divided with the white people.

Mr. MURDOCK. Mr. Chairman, we are glad to have that statement. This is a remarkable story that you have sketched only in minor part.

I often say to my colleagues, in discussing the dedication of the Coolidge Dam on March 4, 1930, that ex-President Calvin Coolidge made a remarkable address but I regard it as the second best made there that day, the best having been made by a full-blood Pima Indian.

Mr. JOHNSON. Yes, sir.

Mr. MURDOCK. Congressman Welch, have you any questions?

Mr. WELCH. No, Mr. Chairman.

Mr. MURDOCK. Congressman Engle?

Mr. ENGLE. No questions.

Mr. MURDOCK. Mr. Lemke?

Mr. LEMKE. I have just one or two questions.

I am certainly grateful to the witness for having given us such a

brief and splendid history. Most statements are too long and we forget about them. You apparently know how to express your thoughts so that we can remember.

I would like to know how many people are in your tribe, approximately.

Mr. JOHNSON. A little better than 5,000, approximately.

Mr. LEMKE. Better than 5,000?

Mr. JOHNSON. The reason it is so close, in the 90 years' time, is because there were so many deaths among our people on account of malnutrition, on account of insufficient subsistence to sustain them through life.

Mr. LEMKE. Have you sufficient lands, provided you can get water, so that you may have sufficient nutrition for all your people?

Mr. JOHNSON. We have sufficient land if we can get the water for it; yes.

Mr. LEMKE. How large a farm do you think each Indian family should have to make a decent living? I do not mean subsistence. I am tired of that word. "Sub" is the latin for "below." That is below existence. I want you to make a decent living, and bring up your children as the rest of us do, if we are able.

Mr. JOHNSON. I think 80 acres would make a fair and comfortable living for any individual on our reservation. As we have now, we only have 10 acres of land.

Mr. LEMKE. You think 80 acres would be sufficient?

Mr. JOHNSON. Just about. It will give us a good living on 80 acres.

Mr. LEMKE. Can the land all be irrigated, or can enough of it be irrigated if you receive the water?

Mr. JOHNSON. Yes. I would say offhand we might develop something like 60,000 acres besides what I have given here this morning.

Mr. LEMKE. That is all, Mr. Chairman.

Mr. MURDOCK. Mr. Morris?

Mr. MORRIS. No questions, thank you.

Mr. MURDOCK. Mr. D'Ewart?

Mr. D'EWART. This is the San Carlos Reservation, for which we had the county agent appearing the other day?

Mr. MURDOCK. Yes, sir.

Mr. D'EWART. How many of these tracts are farmed by Indians and how many are farmed by white men?

Mr. JOHNSON. In our reservation?

Mr. D'EWART. Yes. The tracts in your reservation.

Mr. JOHNSON. There are over 1,700 farm units on our reservation. That is, individual farmers. It ranges from 10 to 80 acres.

Mr. D'EWART. Are those all farmed by Indians?

Mr. JOHNSON. Yes.

Mr. D'EWART. Then these tracts that the county agent spoke of the other day are largely farmed by white men, is that true, Mr. Chairman?

Mr. MURDOCK. Half of the land under the Coolidge Dam belongs to white men, and the other half belongs to the Indians. Of course, 50,000 acres would be farmed as owned by white men.

Mr. D'EWART. Inside the Indian reservation?

Mr. JOHNSON. No; this is in joint works with the white people. The white people farm 50,000 acres under the San Carlos project. There is supposed to be 50,000 acres of Indian land farmed.

Mr. D'EWART. The gentleman told us the other day that this was on an Indian irrigation project. Is that true, whether it is inside the reservation or out?

Mr. MURDOCK. That is right. The Coolidge Dam was built by the Indian Service and the entire project is under the Indian Office.

Mr. D'EWART. Whether it is in the reservation or out? I believe that is not true anywhere else.

Mr. MURDOCK. If I am wrong on that we will be corrected by the gentlemen in the audience, or by the chairman himself, who could correct me if I am wrong.

Mr. D'EWART. Thank you.

Mr. MURDOCK. Judge Bosone.

Mrs. BOSONE. We could almost skip the need of the water, could we not? We realize, being from the West, that Arizona needs the water and California needs the water. Could we not just go from there on? It seems to me that we can agree there is this tremendous need for water. We can start from there.

Mr. MURDOCK. Mr. Poulson?

Mr. POULSON. No questions.

Mr. MURDOCK. Mr. Marshall?

Mr. MARSHALL. I have been a little curious about one thing. You have some years when you have more water in the river than other years. Does that run in pretty regular variance of time?

Mr. JOHNSON. No; we have some water whenever we have rains and floodwaters come in at different times of the season, different times of the year.

Mr. MARSHALL. The flow in your river from one year to the next remains pretty much the same, is that right?

Mr. JOHNSON. There is no flow now on the river.

Mr. MARSHALL. It is dry now?

Mr. JOHNSON. It has been dry in 1947 and 1948. Recently here, 3 months ago, we have had a little rain, so that we have stored a little water now. It only lasts through the year, and that is about all. If we do not have any more rain we do not get any more water.

Mr. MARSHALL. Does the Gila River go dry every year?

Mr. JOHNSON. Practically every year.

Mr. MARSHALL. Practically every year?

Mr. JOHNSON. Yes.

Mr. MARSHALL. So far as you know and so far as you can recall, you receive about the same amount of water in the river from one year to the next?

Mr. JOHNSON. No; it varies. Some waters come in that we cannot control, by means of this floodwater. We have not been able to control these floodwaters, and it runs only a short time. Then it runs down to the Gila.

Mr. MARSHALL. Thank you.

Mr. MURDOCK. Mr. Aspinall?

Mr. ASPINALL. I have no questions.

Mr. MURDOCK. Governor Miles?

Mr. MILES. No questions.

Mr. D'EWART. Mr. Chairman, may I ask one or two questions?

Mr. MURDOCK. Yes, Mr. D'Ewart.

Mr. D'EWART. I want to ask a few questions about the Indian water rights. I gather from the testimony before the committee that the

Indian water rights of this reservation come out of the amount of water allotted to the lower basin.

Mr. MURDOCK. I am afraid the chairman would not be quite able to answer that, because this is on the Gila River.

Mr. D'EWART. Yes.

Mr. MURDOCK. It gets into a pretty complicated matter.

Mr. D'EWART. I understand your point.

Mr. ENGLE. I would like to answer the question by referring to article III (a) of the compact, which says:

> There is hereby apportioned from the Colorado River system in perpetuity to the upper basin and to the lower basin, respectively, the exclusive beneficial consumptive use of 7,500,000 acre-feet of water per annum, which shall include all water necessary for the supply of any rights which may now exist.

The chairman has just testified that the Indian uses existed on the Gila River long prior to the time the white man arrived.

In other words, the 7,500,000 acre-feet of water which is apportioned to the lower basin was apportioned specifically to include and take care of all waters necessary to supply any rights "which may now exist," which was in 1922.

At that time I think it can and will be demonstrated that all of the water on the Gila was in use.

Mr. D'EWART. Granting for the moment that these Indian rights come out of the amount allotted to the lower basin, whether it is on the Gila River or not, do not these Indian rights predate the rights of California, Arizona, or Nevada?

Mr. MURDOCK. I think there is no question about that, Mr. D'Ewart. These men or their ancestors were here 1,000 years ago.

Mr. D'EWART. In other words, this Indian right is ahead of any white man's right whatsoever?

Mr. JOHNSON. We have full right on the Gila River. We have a memorial right on that river.

Mr. D'EWART. Were the rights recognized in the treaty setting up this reservation?

Mr. MURDOCK. I cannot answer that.

Mr. D'EWART. We ran into a somewhat similar situation up on the Navajo Reservation, and there is a question as to the recognition of rights. I wondered where this Indian right fitted into the over-all picture. I do not know whether anybody has gone into that aspect of the situation or not.

Mr. LEMKE. Mr. Chairman, as I understand it, it is recognized in the compact.

Mr. ENGLE. It is recognized in section III (a) as one of the vested rights.

Mr. LEMKE. So we do not have to look any further. They have a right under that compact.

Mr. ENGLE. That is right; and everybody recognizes it.

Mr. MURDOCK. There is another provision of the compact which also recognizes the rights.

Mr. MILES. That would apply to the Gila water in New Mexico, as well as in Arizona, would it not?

Mr. MURDOCK. I think you are correct.

Mr. Regan?

Mr. REGAN. I would like to ask Mr. Engle to clear me up on something that I seem to continue to be confused on.

We talk about 7,500,000 acre-feet of water per year passing Lee Ferry as the water to be divided among the States of Nevada, California, and Arizona. Then you have the formula for that division.

Where does the Gila River water come in under that 7,500,000 acre-feet of water?

Mr. ENGLE. I am glad you mentioned that. The Gila River water is included in the 7,500,000 acre-feet of water; and I think this point should be made very, very clear. That is that when the basin compact was written there was not a division of the water in the stream; there was a division of the water between the two basins.

Let me read to you what the Colorado River compact says. In article II (a) it defines the terms:

The term "Colorado River system" means that portion of the Colorado River and its tributaries within the United States of America.

I repeat—

The term "Colorado River system" means that portion of the Colorado River and its tributaries—

of which the Gila is one.

Then article III (a) reads as follows:

There is hereby apportioned from the Colorado River system in perpetuity to the upper basin and to the lower basin—

they are not talking about the apportionment of the stream, but they are talking about the apportionment to the basin—

respectively, the exclusive beneficial consumptive use of 7,500,000 acre-feet of water per annum, which shall include all water necessary for the supply of any rights which may now exist.

The 7,500,000 acre-feet is the water which is allocated to the lower basin and on the Colorado River system. It was a division of system waters.

Since the "Colorado River system" means "that portion of the Colorado River and its tributaries within the United States of America" it includes the Gila.

Mr. REGAN. But the upper basin of Colorado States furnish Lee Ferry with 75,000,000 acre-feet of water over a 10-year period, or an average of 7,500,000 each year.

Mr. ENGLE. That is the minimum; that is not the maximum.

Mr. REGAN. That is the minimum?

Mr. ENGLE. A 10-year average of 7,500,000 acre-feet has to flow past that point.

Mr. REGAN. That is to be divided between the States. The Gila waters should be involved. Where do they come in?

Mr. ENGLE. The Gila River is part of the lower basin; 7,500,000 acre-feet of water is entitled to be used in the lower basin.

Mr. REGAN. That would be in addition to the 7,500,000 acre-feet?

Mr. ENGLE. No. That is the 7,500,000 acre-feet which is entitled to be used in the lower basin. It includes all the water, just the same as in the upper basin, and all the waters are included, including the water which comes there from tributaries. It is not a division of main flow water.

Mr. ASPINALL. Will the gentleman from California yield?

Mr. ENGLE. Yes.

Mr. ASPINALL. What is meant by the III (b) water, that extra 1,000,000 acre-feet?

Mr. ENGLE. The III (b) water gives the lower basin the right to increase its beneficial consumptive use by 1,000,000 acre-feet.

Mr. ASPINALL. From what?

Mr. ENGLE. Over and above the 7,500,000 acre-feet which is allotted in section III (a) to the lower basin.

Mr. ASPINALL. Where is the water to come from?

Mr. ENGLE. The water is to come from the stream system.

The reason that was written in was because they wanted to protect against the future commitment which this country might make to the State of Mexico.

Let me read you a statement from the brief filed by Arizona in the case of *Arizona* v. *California* which was filed in 1930.

The attorney for the State of Arizona in that litigation was Dean Acheson, who is now the Secretary of State, and he discusses in his brief on behalf of Arizona the significance of III (a) and III (b) water.

Let me read it to you, because it is completely in conflict with the position taken by Arizona in this hearing, and is completely in conflict with the statement made by Mr. Knapp yesterday before this committee in his statement.

Here is what Mr. Acheson said, and I think he is a pretty good lawyer. At that time he was speaking for Arizona and not speaking for California.

Mr. ASPINALL. Just a minute, Mr. Engle, before you read that. You would not suggest that the lawyer for Arizona would perhaps be more competent to state what was in the mind of Arizona at the time the compact was made than perhaps the Commissioner, Mr. Norviel, would you?

Mr. ENGLE. I would say this: When the attorney for Arizona joins with the attorney general of the State of Arizona and places a construction as a legal matter in a brief filed before the Supreme Court on what the compact said, it at least ought to have some bearing on what Arizona thinks about it. It would certainly attach some significance to a situation in which Arizona has completely reversed itself.

Let me read this to you, quoting from Mr. Acheson's brief:

> Under the compact, then, the only water of which the rights to exclusive beneficial use in perpetuity may be acquired in the lower basin is the water apportioned to that basin. Such apportionment is limited to 7,500,000 acre-feet of water per annum by article III (a). The Colorado brief—

This is Acheson speaking, referring to the Colorado brief—

> Page 40, contends that paragraph (b) of article III—

that is the 1,000,000 acre-feet—

> Operates to increase this apportionment to 8,500,000 for the lower basin. This, we submit, is not the case. If it had been intended to apportion the larger amount, the compact could easily have said so.

What Acheson is saying here is that if they intended to apportion an extra 1,000,000 acre-feet in order to make that extra 1,000,000 acre-feet apportioned water they would have said so in III (a). They would have said: "It is 8,500,000 acre-feet apportioned to the

lower basin and 7,500,000 acre-feet apportioned to the upper basin."

However, what they said in paragraph (a) is: "We apportion 7,500,000 acre-feet to each basin."

Then in III (b) they said that the lower basin could increase its consumptive use by 1,000,000 acre-feet. So Mr. Acheson said it was perfectly obvious from reasoning from exclusion that they did not so intend.

He says:

If it had been intended to apportion the larger amount, the compact could easily have said so. The difference in language between paragraphs (a) and (b) is plain, and the difference in meaning is clear.

Incidentally, that is what the Supreme Court said.

Paragraph (b) does not apportion in perpetuity as does paragraph (a), any beneficial use of water. It is very careful not to do this. It is to be read with paragraph (c) and relates solely to the method of sharing between the basins any future Mexican burden which this Government might recognize. This burden is to be satisfied first out of "surplus" waters, and surplus waters are defined, not as surplus over quantities "apportioned," but as surplus over quantities "specified in paragraphs (a) and (b)." Any deficiency remaining is to be borne equally by the two basins.

In other words, 7,500,000 acre-feet apiece means 15,000,000 acre-feet, and plus 1,000,000 acre-feet is 16,000,000 acre-feet.

The Mexican Treaty is to be satisfied out of the waters in the Colorado River over and above 16,000,000 acre-feet.

Thus the lower basin, which without paragraph (b) might use water in excess of its apportionment without acquiring any exclusive right in perpetuity thereto, is enabled to retain such uses to the extent of 1,000,000 acre-feet per annum against the first incidence of the Mexican burden. Thereafter it is entitled to require the upper basin to share from its apportionment equally in the satisfaction of any deficiency. In other words, all that paragraphs (b) and (c) accomplish is to require the upper basin to reduce its apportionment in favor of Mexico before the lower basin is required to do so, the lower basin being entitled to contribute first, to the extent of 1,000,000 acre-feet, water which it may have used but to which it has no exclusive right in perpetuity—that is, water not apportioned to it. The water apportioned is that to which exclusive beneficial use in perpetuity is given in paragraph (a), less any deductions which may have to be recognized as provided in paragraphs (b) and (c).

To boil that down to an illustration, let us assume that the total water in the Colorado River is 17,000,000 acre-feet. The III (a) water is 7,500,000 acre-feet apiece. That is 15,000,000, plus the III (b) water, which makes it 16,000,000.

Now, if the total water in the river is 17,000,000 acre-feet and Mexico is entitled to 1,500,000 acre-feet, somebody is going to have to come forward with another 500,000 acre-feet of water. Where is it coming from?

Two hundred and fifty thousand acre-feet of that water is coming out of the upper basin's 7,500,000 acre-feet, and 250,000 acre-feet of that water is coming out of the lower basin's 8,500,000 acre-feet of water. That is what those paragraphs do, and that is precisely what Mr. Acheson, representing the State of Arizona, joined with their attorney general, contended back in 1930.

We contend it is good law and that it is gospel.

Now, Mr. Chairman, I did not have an opportunity yesterday——

Mr. MURDOCK. I wish you would hold that up until we have disposed of these two witnesses, if you please, Mr. Engle.

Mr. Barrett, have you any questions to ask the present witness?

Mr. BARRETT. I would like to inquire if the present witness takes the position that the State of Arizona is entitled to the 1,000,000 acre-feet of water under III (b) and that it is his position that the part of the water apportioned to Arizona under III (b), according to its own contention, belongs to his tribe.

Mr. JOHNSON. Yes. I would say that Arizona should be entitled to this water from the Colorado.

Now, I do not understand the compact and I am not familiar with it. However, it seems to include the Gila River.

To cut it short, I will say that when this division of water from the Colorado should be extended it would have to be pumped, and an aqueduct would be made in order to irrigate these lands that are in southern and central Arizona, and all of the waters of the Gila flow to the west. You would have to lift the water to run it up further in order to irrigate these lands. The confluence of the Salt River and the Gila River is below Phoenix, and it flows down to the Colorado from there, below us. If you include this water in the Gila River you are including the entire length of it, clear into New Mexico, as I understand it.

Mr. BARRETT. Is there a controversy between your tribe and the State of Arizona?

Mr. JOHNSON. There is no controversy.

Mr. BARRETT. Over the waters of the Gila River?

Mr. JOHNSON. There is no controversy on this Colorado River.

Mr. POULSON. Will my colleague yield?

As I understood Mr. Johnson to say—he can correct me if I am wrong—they were not receiving all the water on the Gila River that they needed. Is that right?

Mr. JOHNSON. That is right.

Mr. POULSON. If Arizona's contention—our chairman, Mr. Murdock, stated that was the fact—is that the Indian rights are prior to the white man's rights, either on the upper or the lower basin, either with reference to California or Arizona, then why does Arizona not recognize and practice that which they profess to believe in, if the Indians have prior rights? Why is Arizona not giving you the prior rights at this time on the Gila River, since she professes that you have prior rights?

Maybe our chairman can answer that.

Mr. MURDOCK. I am certainly unaware that the State of Arizona has deprived the Pima Indians of any use of water. Their project was built by the Indian Service.

Mr. POULSON. Mr. Johnson, I think, stated they could use more water and that they are not receiving sufficient water.

Mr. JOHNSON. As I said a few minutes ago in my statement, this Government has built several dams on the Gila and Salt Rivers. It is not sufficient for our lands to be irrigated from these. Of course, we know that mistakes are made in many instances.

Take Gillespie Dam, for instance. It is below us. What waters are captured in the Gillespie Dam are from this water that flows down that we cannot control. We cannot get any water out of the Gillespie Dam because it will not run uphill.

The second dam that was built was on the Salt River, the Roosevelt

Dam. We also cannot get any water from that because it will not run uphill.

Mr. POULSON. I appreciate that. However, on the Coolidge Dam did you not say a minute ago that the white men were irrigating about 50,000 acres?

Mr. JOHNSON. Yes, but it is insufficient to irrigate our lands.

Mr. POULSON. Yes, but if the white men did not use that water then you could have it, could you not?

Mr. JOHNSON. What did you say?

Mr. POULSON. If the white men did not use the water to irrigate that 50,000 acres you could use that water?

Mr. JOHNSON. Yes.

Mr. POULSON. Then they are taking away from you the water which belongs to you by priority?

Mr. JOHNSON. Yes, sir.

Mr. PATTEN. The water would not have been there if they had not built the dam.

Mr. POULSON. That is all right; but the Government did it. If Arizona professes that the Indian has the first right, she is not practicing what she preaches.

Mr. MURDOCK. I might make this comment: That is a rather strained construction.

The Coolidge Dam was built both for the benefit of the Pima Indians and their white neighbors.

Let us go back to the act of Congress which created the dam, and to President Calvin Coolidge, who signed the bill into law. That was part of the great speech that was made by a masterful Pima Indian on March 4, 1930. He said, just as the chairman of the tribal council has said today: "We did not ask the Great White Father in Washington to take away the water from Graham County and Greenlee County, but we did ask for relief, and the dam is here to catch the flood waters and give us that relief."

The dam was built by the Federal Government for the benefit of the Indians and their white neighbors. That is true, is it not?

Mr. JOHNSON. That is right.

Mr. MURDOCK. However, the lack of water has been the lack of rainfall and collection of water above Coolidge Dam. Both whites and Indians have suffered from that lack. It is the lack of water which you would like to have supplied by water from the Colorado River, to which you have an undoubted right.

Mr. JOHNSON. Yes, sir.

Mr. MURDOCK. We thank you, Mr. Chairman.

Mr. POULSON. Mr. Chairman, the white men still irrigate 50,000 acres out of that water.

Mr. BARRETT. Mr. Chairman, might I ask one question here?

Mr. MURDOCK. Yes.

Mr. BARRETT. Do I understand the contention of the State of Arizona is that the 1,000,000 acre-feet of water that is allocated under III (b) is that amount of water out of the Gila River? That is, in addition to Arizona's share of the water apportioned under III (a)? Also, that the State of Arizona, in turn, recognizes the rights of the Indians to the priority to that particular water on the Gila River?

Mr. MURDOCK. May I ask you to hold that until the attorney for

Arizona can be before us? Charles Carson, Arizona's attorney, is a sick man right now. However, it is hardly a question to put to the chairman of the Pima Tribal Council. It is an involved question. Is that satisfactory?

Mr. BARRETT. That is satisfactory, except that I was putting the question to you, Mr. Chairman. I would like to know what we are discussing here.

I cannot quite follow this controversy here without having the contentions of Arizona and California clearly in my mind.

I certainly did not follow Mr. Engle a moment ago when he contended that the upper basin States were obligated to supply water going to Mexico under the treaty, practically in entirety.

Mr. ENGLE. I did not say that.

Mr. BARRETT. Well, as I understood your contention you said that the waters allocated under III (b) were allocated to the lower basin to meet the requirements to Mexico under the treaty, is that right?

Mr. ENGLE. No. I said this: That the lower basin is entitled to take its contribution to the Mexican treaty water out of that 1,000,000 acre-feet of water, whereas the upper basin has to take its contribution, when it is made, out of the 7,500,000 acre-feet of III (a) water.

I put it this way: If there were 1,000,000 acre-feet short, or 500,000 acre-feet short, down at the line, which had to go into Mexico to meet the 1,500,000 acre-feet, that the upper basin would have to take half of that or 250,000 acre-feet out of their 7,500,000 acre-feet, whereas the lower basin States would take it out of the 8,500,000 acre-feet. In other words, they could take their part out of that top 1,000,000 acre-feet.

Mr. BARRETT. What about the surplus water?

Mr. ENGLE. The water for the Mexican treaty has to be supplied out of the surplus water, but the surplus water is divided as to waters which are surplus over and above the waters referred to in III (a) and III (b).

Mr. BARRETT. That is right. That would be a total of 16,000,000 acre-feet.

Mr. ENGLE. That would be a total of 16,000,000 acre-feet. If you had 17,000,000 acre-feet of water in the river you would be 500,000 acre-feet short of the amount necessary. Then that is where everybody has to start cutting back.

Mr. BARRETT. What about this 1,000,000 acre-feet? According to your own contention, if you say that was given to the lower basin States for the purpose of supplying the water to Mexico——

Mr. ENGLE. I did not say that.

Mr. BARRETT. What did you say?

Mr. ENGLE. I positively did not say that. I said that the lower basin States were entitled to increase their beneficial consumptive use by 1,000,000 acre-feet over the amount of 7,500,000 acre-feet given them under III (a), but the effect of it is to give them the right to take that water out of the III (b) water before they have to go into their III (a) water. The III (a) water is the water which is granted in perpetuity to each basin.

Mr. BARRETT. What I cannot understand is why the compact did not say in so many words that the lower basin was entitled to 8,500,000

acre-feet instead of saying in III (a) that they are entitled to only 7,500,000 acre-feet.

Mr. ENGLE. Because they were not apportioning in perpetuity the additional 1,000,000 acre-feet of water. That is the reason. They were making it first subject to the Mexican treaty.

In other words, Mr. Barrett, what happened was that the lower basin, by virtue of the III (b) provision got a bulge on the upper basin to the extent of 1,000,000 acre-feet of water when it came to satisfying the requirements of the Mexican treaty. That is what Mr. Acheson plainly says in his brief.

Mr. BARRETT. Why did Mr. Hoover, immediately after the compact was arrived at, address a note to Mr. Norviel and say:

> This is just by way of registering again my feelings of admiration for the best fighter on the Commission. Arizona should erect a monument to you and entitle it "One Million Acre-Feet."

What did he have in mind?

Mr. ENGLE. He was paying tribute to the Arizona negotiator for the fact that the Arizona negotiator had put on a vigorous fight for an extra 1,000,000 acre-feet of water which went to the lower basin; and the Supreme Court so held. Nobody takes that away from the Arizona negotiator.

Mr. BARRETT. Why should Arizona erect a monument to somebody who is getting water for California? That is what I would like to know.

Mr. ENGLE. He got it for the basin.

On Mr. Knapp's statement yesterday, page 15, he says as follows, quoting Judge Stone:

> In *Arizona* v. *California*, the Court did not sustain Arizona's claim that the million acre-feet covered by III (b) water was specifically apportioned to Arizona alone.

In other words, the Supreme Court has definitely answered that question.

Mr. BARRETT. All that means is that the Supreme Court did not decide that particular question.

Mr. ENGLE. The Supreme Court said it was apportioned to the basin. You may say that the language was dicta, but Arizona can receive no comfort from it.

Mr. BARRETT. That is all I have to say.

Mr. MURDOCK. These are interesting matters and must be thrashed out, preferably, in executive session when we have heard all the evidence.

We thank you, Chairman Johnson, for a very splendid statement.

Mr. JOHNSON. Thank you, sir.

Mr. MURDOCK. We will now have time to hear the statement of your colleague.

I will ask Mr. Alfred Jackson to come forward.

Mr. ENGLE. Mr. Chairman, I desire to be recognized at this time in pursuance of the commitment made by the Chair yesterday.

Mr. MURDOCK. The Chair cannot recognize the gentleman at this time. We have two witnesses here we want to hear in consecutive fashion and dispose of.

Mr. ENGLE. Mr. Chairman, I make a point of order; no quorum is present. I object to further proceedings on that ground.

I do not like to proceed in this way, Mr. Chairman, but yesterday I made it very plain that I wanted to make a statement in answer to Mr. Knapp. The Chair said that that would be agreeable and I do not propose to be shunted off here continuously. I do not think it is fair to call these witnesses and have them testify at length. In that instance it was practically 2 hours. Then the witness goes out of town without our having an opportunity to ask questions.

I insist upon my point of order that no quorum is present.

Mr. MURDOCK. Apparently no quorum is present.

The committee stands adjourned until 10 o'clock tomorrow morning.

(Whereupon, at 10:55 a. m., Tuesday, April 5, 1949, an adjournment was taken until 10 a. m., Wednesday, April 6, 1949.)

THE CENTRAL ARIZONA PROJECT

WEDNESDAY, APRIL 6, 1949

HOUSE OF REPRESENTATIVES,
SUBCOMMITTEE ON IRRIGATION AND RECLAMATION
OF THE COMMITTEE ON PUBLIC LANDS,
Washington, D. C.

The subcommittee met, pursuant to adjournment, at 10 a. m., in the committee room of the House Committee on Public Lands, New House Office Building, Hon. Toby Morris (acting chairman of the subcommittee), presiding.

Mr. MORRIS. The subcommittee will now come to order.

I might make this announcement: That the chairman of the subcommittee, Mr. Murdock, is now at the White House with other parties attending a ceremony, and will be detained for a little while at the White House. He asked me in order to conserve time to act as chairman during his absence and to proceed until he can get back. He expects to get back very shortly, probably by 10:30 or 11 o'clock.

In the meantime, we will proceed with the testimony and the statements in order not to lose time.

According to Mr. Murdock's direction, I now call for Mr. Jackson, who I understand has a statement to present to the subcommittee.

Mr. Jackson, will you give your full name, your representative capacity, if any, to the reporter, please.

STATEMENT OF ALFRED JACKSON, GILA RIVER INDIAN RESERVATION, ARIZ.

Mr. JACKSON. Mr. Chairman and members of the committee, my name is Alfred Jackson and I am a member of the Pima Indian Tribe of Arizona. I was born in the village of Sacaton and have lived on the reservation all my life. I attended school in Tucson and later went to Phoenix Indian School, from where I graduated in 1915. Since leaving school I have taken an active part in the social, religious, and economic life of our little community. I might add that our family has, for many generations, been interested in the improvement and development of our people and their reservation. My colleague, Mr. Johnson, has given you the history and background of our irrigation project and I, in turn, will tell you something about our social and economic life; the way we live, the kind of homes we build, the crops we grow, and other facts about our people.

I might say that we have been the connecting link between the prehistoric man of the stone age and the white man who has come into our country and created what we call the machine age. Our people

did not make stone implements. Our ancient farmers planted their crop with the aid of a sharpened stick with which they opened the soil, and after dropping in the seed they tamped the earth about it with their feet. Their women and children guarded the growing crop against destruction from birds and wild animals and the men themselves defended their harvest with their war clubs against marauding bands that came to steal it from them.

They grew corn, beans, squash, and cotton. Their native corn was not like that grown in the Iowa Corn Belt. It grew only a few feet in height, and the small ears with their irregular rows of small round kernels seldom yielded more than 10 bushels per acre.

For several centuries we have grown a little bean that we call teppery. Some are white, some are brown, and even today they are still a favorite with our people an we grow a lot of them for our personal use.

Often when the summer rains were short our corn did not mature, but the quicker-growing bean provided our only source of food.

Our pumpkin-like squash was cut in strips and dried and stored for winter use very much as I understand the early white farmers did a century ago.

From our native cotton we wove material for our breechcloth and other clothing for our women and children.

When our fields did not produce the simple necessities of life for us because of lack of rain, we turned to the desert for our subsistence. We gathered the fruits of different cactus plants and dried them and stored them away. We gathered the beans from the mesquite tree, the Palo Verde, the catclaw, and other seeds and berries that grew along the desert washes.

The early Spanish padres brought in horses, cattle, wheat, and other farm crops that we found would grow on our lands. Wheat soon became the most important item in our diet. We did not have any flour mills, but we ground the whole kernels on a flat stone which we called a metate, and from this coarse flour and a little grit we made a thin cake which we cooked on coals and was called tortilla. Also, we placed some live coals in an earthen pot and sprinkled wheat over these coals and parched it, then ground it into fine meal which we called pinole. We mixed this into a thin uncooked gruel which we drank, and it gave us great strength. When our warriors went out to battle, a little bag of pinole tied to their belts took the place of the field kitchen in a modern army.

With the coming of American farmers into our country, all these things changed. They brought in many other crops, and today we are growing alfalfa, barley, sudan grass, sorghum grains, wheat, cotton, along with many vegetables and fruits, the same as any white farmer in our area may grow.

Last year we sold 59,340 bushels of wheat; 148,117 bushels of barley; 134,143 bushels of sorghum grains. This latter grain has taken the place of corn in the Southwest since it yields much more per acre than corn.

We no longer grow the short-fibered wild cotton that our forefathers grew, but the Department of Agriculture has developed a variety of cotton at the Sacaton Experimental Station that is known as

Pima long-staple cotton and is used all over the world. We have 3,705 acres of hegari, 4,566 acres of barley, and 320 acres of cotton for harvest this year, and it will require all of our allotment of water to mature these crops. For the past two seasons it has only been possible for us to operate about 30 percent of our land, but increased water permits a slightly increased acreage this year.

Our homes are built from native materials we find close at hand. We use adobe, ribs from the giant cactus, mesquite, and cottonwood poles from along the river; and we thatch our roofs with a thick mat of arrowweeds that grow in the bottom land, and over this thatch we lay a heavy layer of earth that not only keeps out the rain but some of the heat from our Arizona sun. Our houses are quite different from the beautiful homes I have seen in Washington, but for us they are home and we are comfortable and happy in them. I will not say we are content, for we are not. We want a house like our white neighbor has. We want an electric refrigerator and a radio and modern farm machinery like he has. We are thrifty and we want to work and earn these things. Our climate is good and our lands are fertile, but we have one great need and that is water, and unless you have felt the thirst of the desert as we have, it is hard to realize how great that need it.

We realize that our lands represent only an insignificant part of the wealth of southern Arizona, but to us they represent all that we have. They are our last heritage. The large commercial farms, the citrus groves, the date orchards, and the vast fields of winter vegetables that the white men have represent an immense commercial investment; while our lands mean our subsistence, our only way of making a living. We appreciate the interest of our white neighbors and the opportunity they have given us in presenting our case to you, for we want our children to share along with theirs in the benefits and the advantages that the central Arizona project will bring to both.

Mr. MORRIS. We thank you for your statement, Mr. Jackson, and will give it due consideration.

Mr. LEMKE. Mr. Chairman, may I make a comment?

Mr. MORRIS. Mr. Lemke?

Mr. LEMKE. Do you raise wheat and barley without irrigation?

Mr. JACKSON. With irrigation.

Mr. LEMKE. I want to congratulate you, and again congratulate Mr. Johnson, for giving us great masterpieces. I think some of the white people who expect hand-outs without working ought to go to your tribe and be civilized into modern life.

Mr. CRAWFORD. Mr. Chairman?

Mr. MORRIS. Mr. Crawford.

Mr. CRAWFORD. Mr. Jackson, do you people have any modern machinery with which to handle these crops you are now growing?

Mr. JACKSON. We have some; yes, sir.

Mr. CRAWFORD. How do you acquire that? Do you buy it from the local implement dealers?

Mr. JACKSON. Yes; mostly.

Mr. CRAWFORD. Is that machinery pretty high in price down there?

Mr. JACKSON. Pretty high; yes.

91190—49—ser. 11, pt. 1——14

Mr. CRAWFORD. What are some of the tools that you use?

Mr. JACKSON. Well, we have some ordinary tools. Some of the boys that are taking up farming under the GI bill of rights have managed to acquire their own machinery such as Caterpillars and plows.

Mr. CRAWFORD. You have some Caterpillar tractors?

Mr. JACKSON. Yes; tractors.

Mr. CRAWFORD. Farm-all tractors?

Mr. JACKSON. Yes.

Mr. CRAWFORD. Mowing machines?

Mr. JACKSON. Yes.

Mr. CRAWFORD. Automatic hay balers?

Mr. JACKSON. No.

Mr. CRAWFORD. Do you do that?

Mr. JACKSON. No.

Mr. CRAWFORD. That gets into a pretty big operation, with that type of machine.

Mr. JACKSON. Yes, sir.

Mr. CRAWFORD. What do you use for fertilizer down there? Do you have to fertilize?

Mr. JACKSON. We only use stubble, I guess, and plow it under.

Mr. CRAWFORD. You do not use commercial fertilizer?

Mr. JACKSON. No.

Mr. CRAWFORD. You rotate your crops to take care of that?

Mr. JACKSON. Yes.

Mr. CRAWFORD. That helps the production of the soil?

Mr. JACKSON. That is right.

Mr. MORRIS. Do any other members of the committee desire to ask the witness any questions?

If not, you may leave the witness stand, Mr. Jackson. We appreciate very much your contribution, and will give it careful consideration.

Mr. JACKSON. Thank you.

Mr. MORRIS. I believe Mr. Moeur said that he had a statement he wanted to file with the committee. Is that right?

STATEMENT OF J. H. MOEUR, SPECIAL ATTORNEY FOR THE ARIZONA INTERSTATE STREAMS COMMISSION

Mr. MOEUR. Not exactly, Mr. Chairman. My name is J. H. Moeur, special attorney for the Interstate Stream Commission of Arizona.

I wanted to offer for the record a number of statements of different witnesses, without reading those statements.

Mr. MORRIS. All right.

Mr. MOEUR. First is the statement of Barry M. Goldwater, a member of the Arizona Interstate Stream Commission.

Mr. MORRIS. The statements will be received, filed, and will become a part of the record.

Mr. MOEUR. Mr. Goldwater's statement is somewhat of a historical picture of the river. He is one of the few men who has been down the river in a boat several times.

(The document is as follows:)

STATEMENT OF BARRY M. GOLDWATER, MEMBER OF THE ARIZONA INTERSTATE STREAM COMMISSION

By name is Barry Goldwater; my home is Phoenix, Ariz., and my occupation is merchant. Being a native of Arizona, it is only natural that I have grown up with a full realization of the need for and the value of water to our economy. Now I am neither an engineer nor a lawyer, and I have but slight acquaintance with the actual work the farmer does in irrigating his land, but because of my interest in water as a necessity to our economy, I long ago undertook a hobby-like study of our waters and where they came from.

This study, naturally, has been limited to what a layman could find out and understand and at this time I would like to present to you a brief outline of the basin from a layman's standpoint in the knowledge that it will make more understandable to you the subsequent technical discussions regarding the Colorado River and its basin. I suppose I should further qualify myself by telling you that this interest in the Colorado and its basin is not new to my family by any means, because 88 years ago my grandfather settled on the river's muddy banks and began a business that is still in operation. For many years this river provided our business with transportation that was so vital to our endeavors in the field of merchandising and freighting. During the years I have, from time to time, made several boat trips down its waters until today I can look back on periods of boating that have taken me down the Green River from Green River, Utah, to the Colorado and down that stream to Hoover Dam and on down below that to the city of Yuma. I have included a trip down the San Juan and to augment what I could not see by boat, I have thoroughly explored the entire basin by many trips in an airplane up and down its beautiful and interesting expanse. These things I mention, merely to establish in your minds that I have seen the things I am going to tell you about the basin. As I told you before, I saw them through the eyes of a layman and that is just the way I want to describe them to you today.

To begin with, you must realize the immensity of this basin and the river that drains it. Sitting back here, that is hard to do, but look at this map. It shows you the United States, and here, dominating the inland West, is the Colorado River Basin. The basin comprises 244,000 square miles, all in the United States except 2,000 in Old Mexico. The Salton Sea Basin has another 7,800 square miles and is sometimes thought of as being a part of the Colorado River Basin, but as it does not drain into the Colorado, it can't be called a part of the main basin. From Wyoming to Mexico the basin is 900 miles long and varies in width from 300 miles up here to 500 miles down here in the lower basin. To the northeast, its boundaries are the Rocky Mountains and to the west the mighty Wasatch Range in Utah marks its size. Way down at the bottom end of the lower basin the San Jacinto Mountains form a southwestern border for the basin. In this area we find elevations from 200 feet below sea level to over 13,000 feet above sea level, and vegetation commensurate with those extremes of altitudes. Climate varies from the dry hot air of the deserts to the cold crisp air of the mountains. Temperatures go from 50 degrees below zero to 125 degrees above zero. Rainfall will be as low as 2½ inches down in the desert to over 50 inches a year in the high reaches of the Rockies. No similar area on earth can present such a variation in so many factors affecting human life as can this Colorado River Basin, and no comparable area can boast of a natural resource as powerful and undeveloped as this river to sustain and promote human life. Its 1,400-mile length has its head nestled in the clear lakes and glaciers of the Rockies and its feet in the warm waters of the Gulf of Lower California.

Compared to the age of the river and the basin, this argument about the use of its waters began only a fraction of a second ago. In this basin we find the oldest rocks known to man, over 800,000,000 years old and the river itself has been wandering along in some shape or other for untold millions of years. In this area up here where we find the headwaters of the Colorado and the Green in the same chain of mountains, the Rockies, we find an area of giant mountains of granite, lava, and sharply folded sedimentary rocks. Here is an area of undescribable beauty. Mountains that rear their heads into the sky, down whose sides tumble pure, cold streams of water teeming with trout. Mountains whose perpetual snows and glaciers provide the bulk of the water the river system carries. Mountains whose sides have been torn away by the streams to provide the rich earth of the valleys below. Mountains whose forests and mines mean much to the economy of Wyoming and Colorado.

As we come down into the central part of this basin we begin to find rocks of a different geologic origin. During the many millions of years that this basin has existed, there have been several oceans that have covered this area or parts of this area. Through these seas would protrude high mountains, and against these mountains strong winds would blow just as they do today. These winds would carry away minute particles of these mountains in the form of sand and then the sand would settle into the sea and fall to the bottom. There, the tremendous pressures would compress these sands into layers of sandstones. When the oceans receded, we would find vast areas of sandstones colored from soft pastels to vivid reds. Now this river which at first was a sluggish thing, maybe 30 miles wide, started to work on these rocks. A gradual elevating of the lands more and more confined the river to a smaller channel and increased its cutting effect. Today in this area we find, without doubt, the least explored, wildest part of the United States. An area of thousands of square miles cut by canyons hundreds of feet deep and varying in width from 3 or 4 feet to many miles. An area into which few white men have traveled because of the lack of roads or incentive. This is the country of the Navajo, the Ute, and the Hopi. An area of awe-inspiring formations of sandstones that has, as its potential, the greatest tourist attractions in this country.

Then we will go on down to the lower part of this basin. This is the country of Nevada, eastern California, and Arizona, the lower basin. Here we find broad, flat valleys separated by low ranges of mountains. The valleys are filled with immense deposits of alluvial gravel and are fertile beyond man's fondest hopes. These are the valleys that need but the touch of water to become immediately and profitably productive. Here, too, are vast deserts. Some, like down in this area [points] are unending stretches of delta sand, barren of even the smallest plant. Others are really not deserts like you would think a desert should look. Over here in Arizona some of these valleys I told you about are called deserts, but they are covered with a dense and interesting growth of cacti and small brush and trees, and present anything but a picture of the desert. This area over here, which is called the Imperial Valley, has on its eastern edge one of these vast sand deserts. In fact, if it is the one you see in the movies when the Foreign Legion takes after the bad sheik. This Imperial Valley was formed by the Colorado, and its formation was so interesting that I must tell you about it.

The Gulf of Lower California at one time extended far up the present river, probably to above Needles. The river, in the forming of its delta, gradually built a channel around this arm of the sea, and while this body of water was fed for a time from the river, finally that source cut itself off and the water eventually evaporated, leaving a large, deep valley whose floor was quite fertile, but nearly 200 feet below sea level. As a result of attempts to irrigate this valley with Colorado River water, the channel was so altered that when the disastrous floods of 1905 and 1906 came down the Gila and the Colorado they started to pour themselves into the Imperial Valley. That flood of water was finally stopped, but not until the Salton Sea was formed.

On down below here the delta of the river starts, and today, as a result of the building of dams up above, we find clear blue water flowing out to the sea where a silt-laden stream once pushed itself mile after mile down the valleys of Arizona and California to form an intricate delta pattern. This action is not taking place any more because of these dams and the removal of the silt. Instead of a delta as such, the river now flows to the Gulf through a well-defined channel. The land in this area is in Mexico, and, like the bottom lands in other parts of the basin, is very fertile.

In this past discussion I have tried to cover briefly a description of the geography, geologic history, and the scenery of this basin. Those things took place so many millions of years ago that we can hardly even comprehend such vast time, but the written history of this stream and this basin is an interesting one, and an understanding of it will facilitate your consideration of its problems.

As the result of an exploration made by Cabeza de Vaca, which went from somewhere near the delta of the Mississippi to Mexico City and lasted from 1528 to 1536, and which brought to the latter city tall tales about fabulously rich cities to the north, the exploration of the Southwest began. Cortes, who was the head man in Mexico then, and who was no man to turn down the chance of easy gold, started sending parties out in 1539. It was one of these explorers, Ulloa, who first saw the mouth of the Colorado. He was trying to determine if Baja California was a peninsula or an island. On coming near the mouth of the river he witnessed the giant tidal bore that exists there twice a day and decided to end

his investigations there. In the following year, 1540, the greatest conquest of all started. That was the Coronado Expedition, which went in two parts, one by sea, under command of Alarcon, and the other by land, under Coronado himself. Alarcon sailed some 80 leagues up the river, according to his diary, which put him some distance past the present city of Yuma. That, we can say, then, was the discovery of this river. But even when white man discovered it he found that the Indian had been using its waters for protection and farming for many years before. Man has lived from, and on, this river for over 20,000 years.

We are further indebted to the Coronado expedition for the discovery of the Grand Canyon in 1542 when one of his lieutenants, Cardenas, was led there by the Moqui, or as we now know them, the Hopi. The Coronado expedition made deep explorations into the lands to the east and north but returned to Mexico City empty handed as far as riches went. They returned without material riches, but they gave to the world the richness of the knowledge that these lands that now form our basin existed. In the next 250 years, many Spanish explorations came into the basin area, some came looking for gold or silver while others came to spread the work of God. These men, explorers, merchants, and padres alike depended on the river and its tributaries for transportation and sustenance and we find many references in old Spanish chronicles to the Colorado River or the Gila. This old river has carried over five different names in its life and it was not until the last 200 years that Colorado began to emerge as its name—Colorado, red color.

In the early 1800's men began to work the river and its tributaries for beaver, and we find in that period many Americans beginning to explore this basin for its mineral, agricultural, and other natural wealths. In 1869 the first complete study and exploration was started on the river system by Maj. John Wesley Powell, a one-armed Civil War veteran who, in May of that year, set out from Green River, Wyo., in 4 boats with 10 men to drift down these rivers of mystery. I have not gone into the river with much detail up to here for I wanted a vehicle on which to carry you, and now that I have it with Major Powell's party, let's go downstream.

The Green River rises in the Wind River Mountains of southwestern Wyoming, emerging from a glacier and small lake over 13,000 feet above sea level. It flows over through the corner of Colorado through the Dinosaur National Monument, then into Utah. It has been in the mountain country up to here, but when it gets into Utah a bit, it runs into the first of the sandstones I mentioned. Here, with the exception of a few places, the river becomes confined in canyons for the rest of its trip to Lake Mead. Where one of these canyons end and another starts, the Green River enters the Colorado. I mentioned the Green first because, until 1922, the Colorado was considered as being formed by the junction of the Green and the Grand here at the head of Cataract Canyon. In 1922 the Legislature of Colorado changed the name of the Grand to the Colorado, so if you are asked today where that river rises, you must say in Grand Lake on the western slopes of the Rockies, about 100 air-miles northwest of Denver. This newly named Colorado flows down through deep, rugged canyons, through wooded lands, and over flat green meadows to meet with the Green River here at this point. At the southern end of this canyon we find Dark Canyon Dam site. Below here the river is joined by the Dirty Devil River whose name has been changed to Fremont to honor Gen. John Fremont, who has listed among his many honors that of being Governor of Arizona. Below there we find the river entering its most beautiful canyon, Glen Canyon. It stays in this canyon for nearly 200 miles, and during its course through here is joined by the Escalante River, which drains the vast Escalante Desert, and the San Juan River, which rises over in Colorado, runs through New Mexico, and flows across the southern part of Utah—the last 90 miles through a wondrous canyon system of its own. This river brings down much of the red silt from the Navajo country that gives the river its name of "Red." Near the mouth of Glen Canyon we come upon another important dam site which, when built, will back water up through the entire course of Glen Canyon. The water through here flows very placidly and one finds no rapids. Throughout this canyon one is confronted with historic spots marking the advent of the Spaniard and of the American. It is truly one of the most interesting stretches of the river as it winds its way through this wide and shallow red sandstone-walled canyon.

Below Lee Ferry, which marks the end of Glen Canyon and the start of Marble Canyon, and also the boundary between the upper basin and the lower basin, the river plunges into the greatest of its canyon cutting efforts. Marble Canyon

actually is a part of the Grand Canyon, but as there is a definite line of demarcation at the place where the Little Colorado comes in, we treat it as a separate canyon. For 64 miles the river cuts into the flat plateau to a depth of, at one place, nearly 4,000 feet. The canyon is extremely narrow, never more than a mile or so in width. Here the river drops nearly 600 feet, or about 10 feet to the mile, thus creating many rapids. As we go along I will point out the various dam sites that have been surveyed. They are so numerous that I will only name the more important ones. It is interesting to note, though, that 17 out of the 28 dam sites in the lower basin are in Arizona and that the remaining border on this State.

At the end of Marble Canyon the Little Colorado, rising in eastern Arizona. comes into the big river and here, too, the Grand Canyon officially starts. For 230 miles this canyon, cut a mile deep, and at places 11 miles wide, twists and turns through the Kaibab Plateau and the little-known area of northwestern Arizona. We pass here Bridge Canyon Dam site which is of paramount importance to us in Arizona. Here is to be located the giant dam that will funish power to lift the water from Lake Havasu into the central Arizona project aqueduct, and thereby furnish badly needed supplemental water for present irrigated lands in central Arizona. This dam will also furnish power to run our expanding industries in Arizona.

Immediately below here, the river ends its wild plunge from the mountains of Wyoming and Colorado as it backs up behind the mass of Hoover Dam, forming Lake Mead. Near the headwaters of Lake Mead we come upon graphic evidence of the silt problem this powerful river presents us with. I have not emphasized silt before, awaiting our arrival at this place to tell you about it. This river, as it cuts through the sandstones and the granites and other rocks that make up its bed, and as its tributaries bring in their loads of erosion material, accumulates enough silt to fill 10,000 boxcars in a single day. This carrying power of the river has built the large delta of the river and, as I pointed out before, has been responsible for the creation of the Imperial Valley. This silt problem is recognized as the remaining large problem of the river. Its floods are largely controlled by the dams already built, but additional silt regulation must be provided for. The construction of Bridge Canyon Dam will prevent the further silting up of Lake Mead, but in order to more fully control the silt on the entire river, the bill before you contemplates the building for silt control of a dam on the San Juan River and another on the Little Colorado River. If the dam is built at Glen Canyon, it might not be necessary to build the dam on the San Juan. In addition to this, soil-conservation methods have been instituted on the Navajo and Hopi Reservations which, if carried through, will aid materially in removing the threat of this danger that, if allowed to go unchecked, will impair the efficiency of the planned and existing projects in the years to come. The Colorado River below Hoover Dam runs into another great project that will soon be giving to the people of the Southwest its small portion of the tremendous unused resources of the river. This is Davis Dam. Below Davis Dam the river is well out into the valley and desert country and before it even has a chance to get going good again, it backs into Havasu Lake, formed by Parker Dam. This lake furnishes Los Angeles with a water supply that will more than take care of any anticipated growth in the years ahead. It will also furnish the central Arizona project with water. Here the tributary river, called the Bill Williams, comes in from Arizona. This stream drains the western part of Arizona.

A small diversion dam immedately below Parker Dam diverts water onto the Colorado Indian lands that will figure prominently in the coming rehabilitation of the Navajo and Hopi Indians. As we go on down this river, we pass the city of Blythe, Calif., in the center of a fertile and well developed irrigation project. On down below here, and just above the city of Yuma, Ariz., the river is diverted by the Imperial Dam into the giant All-American Canal which irrigates the entire Imperial Valley and supplies so much water that it cannot all be used and is wasting into the Salton Sea to such an extent that it is inundating farms and even buildings. On the east of this dam, water is diverted to irrigate the new project on the Yuma Mesa. From this dam to the sea is a matter of seventy-odd miles where the river flows almost entirely through Mexico. The Gila River, one of the Colorado's largest tributaries, enters the main stream just below Imperial and Laguna Dams. This river is a sizable system in its own right, rising over in New Mexico and flowing through Arizona where it adds to its waters those of the San Pedro, the Santa Cruz, and the Salt River.

I know, from my own observation, that central Arizona needs water from the

Colorado River for a supplemental supply to irrigate lands now under cultivation, not to bring in new land, but to keep land now under cultivation from going back to the desert. Other witnesses will present in more detail the urgent need for this water and the availability thereof.

Mr. MOEUR. The next statement is that of Mr. J. A. Roberts, a farmer. None of these men are here. That is the reason I am offering their statements.

Mr. MORRIS. Yes.

Mr. MOEUR. Mr. Roberts' statement deals particularly with the San Carlos project with which he is associated. He is a farmer who lives there.

(The document is as follows:)

STATEMENT OF J. A. ROBERTS, FARMER OF COOLIDGE, ARIZ., BEFORE HOUSE SUBCOMMITTEE ON PUBLIC LANDS

Mr. Chairman and members of the committees:

My name is J. A. Roberts. I appear here in behalf of the central Arizona project as proposed under H. R. 934, and in an effort to explain to the committee the urgent need for the importation of Colorado River water into the central Arizona area, and to explain in particular the needs of my immediate locality for an additional or supplemental water supply.

I represent and speak, not only for the general economy and interests of our valleys but, for hundreds of the smaller farmers and working people who, partly because of the very circumstances we are considering, are unable to spare either the time or the money to appear here.

I am a farmer living on and operating a farm which I own near Coolidge, Ariz. I am a member of the Arizona Interstate Stream Commission, a body created by our State legislature, charged, among other duties, with that of formulating plans and development programs for the control and use of the waters of our interstate streams. As the operator of a cotton gin, I am in position to maintain close contact with farmers in our area and I believe I know their farm problems. The area in which I live is called the Casa Grande Valley and is located entirely within Pinal County, Ariz. This county has an area of some 5,350 square miles and is larger than two or three of our smaller Atlantic seaboard States.

I went to Arizona from my native State of South Carolina, some 20 years ago. I have seen thousands of acres of the dry barren desert cleared, leveled, and brought to a high state of production. I have seen towns and cities built and a prosperous and substantial civilization established as a result of irrigation there. This has all been possible through the use of water which was available in our rivers and in the underground reservoirs which were found to exist under a portion of the central Arizona valleys.

We are now finding that, to some extent, our available gravity supply from the rivers has been overestimated and, perhaps more important, that the underground supply is not proving sufficient to maintain our present development. We are already seeing some abandonment because of failing water supply. Some of our farmers who were in a position to do so have already moved out. We are convinced that abandonment of both farm and urban development, and of the civilization dependent upon it, will be an ever-increasing result unless the required supplemental water can be secured. Because the Colorado River is the only remaining source from which this additional water can be had, we are desperately in earnest in our appeal for Federal assistance as provided in this bill. We do not ask this as a gift or subsidy, but ask that it be approved as a justified and worthwhile investment—one which which will more than repay its cost.

The Casa Grande Valley is part of a broad river plain formed by deep alluvial deposits from the Gila River and its two large tributaries, the Salt River and the Santa Cruz River. This broad valley lies south of and adjacent to the Salt River Valley in which is located the Reclamation Bureau's Salt River project. Its irrigated portion is about midway between the cities of Phoenix and Tucson. There are now in excess of 200,000 acres in cultivation in this Casa Grande Valley. This acreage amounts to about 7½ percent of the county's total area. We have no expectation of irrigating any additional acreage and are making no effort to do so.

The irrigated lands in our area are divided into two general classes. First, we have those lands with gravity water rights, these being entitled to take water from the Gila River by established legal rights. Such rights are appurtenant to these particular lands and cannot be traded or transferred at will. The waters of the Gila River are impounded behind the Coolidge Dam which is located about 60 miles east of the valley area. These waters, to the extent available, are used during each irrigation season for release down the stream and for diversion to the lands having these rights. These are the lands included in what is known as the San Carlos Federal irrigation project, and to which I may refer simply as "the San Carlos project." Lands in this class are known as "gravity lands" because their water supply comes by gravity flow through the canals and laterals of the project system.

Our other class of lands is that which obtains its water solely from underground sources through pumping. The area of these lands has been increasing rapidly during the past few years, and the area now irrigated solely by pumping is in excess of that by diversions from stream flow.

GRAVITY LANDS

Irrigation with waters of the Gila River in my area dates back many years. The Pima Indians have lived in our county along the banks of the Gila from time immemorial and have always been an agricultral people. They, as well as we who have arrived in more recent years, are dependent on the water supply. These Pimas have their own reservation just below and adjoining the area settled by the whites and are entirely dependent on the supply of irrigation water which may be available through this San Carlos project.

Irrigation by the whites in Pinal County commenced sometime between 1860 and 1870, being confined at first to small tracts along and near the Gila. These served an important place in the furnishing and feeding of both man and beast during those pioneer days when travel was by stage coach and mule team. Without them, travel through this area would have been impossible during a large part of each year because of lack of food for the people and grain and hay for their teams. As the years went on and population increased, more and more canals were constructed and more land cleared. One canal was built about the year 1895 which took water from the Gila at a point above Florence, at the head of our valley, and extended about 40 miles to a point west of Casa Grande. A system of laterals from this main canal delivered water along the way to about 6,200 acres then owned and farmed by those pioneers.

In those early times, without modern methods and equipment, it was neecssary to rely on brush and fill dams to raise the water and divert it to the canals. These were insecure and unsatisfactory. The dams would be put in and repaired while there was little or no water in the river. Then, when the rains came, often the floods would be so heavy that the dams would be taken out by them. Repairs could not be made until the flow subsided, and then perhaps it would be too late to secure much of the water. At the time of my arrival there, because of this lack of security, many of the settlers had become discouraged and moved out. A new group, with new enthusiasm and optimism, was moving in. Owners and entrymen on around 100,000 acres in the Casa Grande Valley formed a mutual association and pledged themselves to meet assessments, either in labor or in cash, and start construction. Before they became convinced that the undertaking was too large to finance in that manner, about $140,000 had been expended in the construction of a main canal. This is the identical canal later taken over and completed by the United States Indian Service in their construction of the San Carlos project.

The project is composed of 50,000 acres of irrigable land in the ownership of non-Indian farmers and 50,000 acres under existing canals in Indian ownership within the Gila River Indian Reservation. The project extends along the valley of the Gila River for a distance of approximately 40 miles, the northwest portion being adjacent to the lands of the Salt River project a few miles south of Chandler, Ariz. This San Carlos project was initiated by the Interior Department through the Indian Irrigation Service, primarily as a means of reestablishing an irrigation water supply for the Pima Indians who had been irrigating from the Gila River from time immemorial. With the advent of the white men who settled along the river above them, the supply of the Pimas had been depleted, and this was in some measure restored through the construction of the project. Since that construction and the initial storage of water behind the

Coolidge Dam, the water-supply problem of the area below the dam, on the lands of both Indians and whites, has been altered somewhat due to the rapid expansion of other agricultural areas higher up the river above the dam and also in the areas immediately surrounding the project acreage. It has been found that demands on the Gila River above Coolidge Dam are greater than were estimated some 30 years ago when construction of this San Carlos project was under study. The pump irrigated area in the valley surrounding and adjoining the project has been growing to such an extent that the so-called pump lands now reach to the very boundaries of the project area, and because of this pumping, the gravity lands within the project have suffered, along with other lands in the general lowering of the underground water table.

It is generally accepted that lands in this locality and climate require a minimum of 4 acre-feet per year to yield efficient production. A lesser water supply results in less yield of important crops, or in the growing of the less desirable crops, and in the abandonment of crop rotation practices which are important in maintaining economic production. With proper water supply, we are able to not only produce better yields of the more essential crops, but are able to follow rotation and soil building practices which will maintain the condition and fertility of the land for future years and for the future generations who, we hope, will follow us there. Based on the 4 feet for each acre, the lands under the San Carlos project require a total of 400,000 acre-feet each year.

Because of the serious lack of sufficient water available through the gravity system since the construction of this project, an effort has been made to make up the deficiency by pumping from the underground into its canals and laterals, thus supplementing and adding to the gravity supply. During recent years the amount pumped by the project has exceeded the amount available from its stream and reservoir supply. Even with this pumped water included, the total which could be delivered to project lands has been considerably less than a normal supply. It still has been necessary to abandon a large part of each farmer's acreage. In this connection it must be remembered that we cannot expect this supplemental pumped supply to remain always available because of the steadily lowering underground water table. Many of the project wells have failed seriously and some have failed completely. A program of deepening is now under way whereby an effort is being made to get this supply from the greater depths.

In the neighborhood where my farm is, water stood in the wells at 30 to 50 feet from the surface a few years ago. Now we find it at 80 and 100 feet in the same wells. In some localities water is now being pumped from more than twice that depth.

Distribution of water for use on gravity lands is under direction of the project and each acre is allotted an equal share in the stored and pumped waters available. The administrative organization responsible for the operation and maintenance of irrigation works and general administration of the affairs of the 50,000 acres of lands owned by non-Indian farmers, is called the San Carlos Irrigation and Drainage District. I have served as a member of the District Board of Directors continuously since the year 1938. The care of the irrigation works and the administration of matters affecting the 50,000 acres of Indian owned lands on the project is under the direction of the Secretary of the Interior acting through the Office of Indian Affairs.

Returning now to the amount of water available for use on gravity lands each year, I desire to make the point that the farmers on gravity lands are primarily concerned with the amount of flood run-off from the upper watershed of the Gila River which enters San Carlos Reservoir behind Coolidge Dam and becomes stored there for release to and use upon their lands below. To the extent that winter snows and early spring rains combine to produce stored water during the months of December to March inclusive, the farmer in the valley below is assured of a controlled supply for his crops during the period following the winter months which produced the run-off and the stored supply. The heaviest run-off since the completion of the Coolidge Dam occurred during the winter of 1940–41 and the resulting stored supply carried the gravity lands for a 3-year period. However, in years of extremely low flow, where these occur in sequence such as has been experienced during the years 1944 to 1948, gravity lands enter the year with inadequate stored supply and must then depend largely on water from pumped sources. Since the pumped supply cannot be depended upon to furnish more than 20 to 30 percent of an adequate amount, an almost empty reservoir behind Coolidge Dam such as has obtained during the past 3 years, forces the gravity land farmer to restrict his farming operations

to that portion of his acreage which can be served by pumps. He cannot spread the short supply thinly over all his land because by such means, no single acre would yield any crop. With 25 percent of a year's supply available, such as we have had on the project during the past few years, he must farm but 25 percent of his farm area. The balance of his farm must be retired until all or a portion of it may be farmed in some future year as water from the stream may be captured in storage.

Showing this variable and uncertain supply of water for gravity lands, there is tabulated here the apportionment made available for each acre of land in the San Carlos project for the years 1938 to 1948, inclusive:

Total yearly allotment of stored and pumped water for San Carlos project, Arizona, as related to normal requirement of 4.00 acre-feet

Year	Total acre-feet per acre	Deficiency	Year	Total acre-feet per acre	Deficiency
1938	1.55	2.45	1944	3.35	0.65
1939	1.25	2.75	1945	2.05	1.95
1940	1.40	2.60	1946	1.00	3.00
1941	3.60	.40	1947	1.00	3.00
1942	4.20	.00	1948	.80	3.20
1943	4.00	.00			

It should be noted that the above table includes water available from both gravity supply and from pumps. Of the above amounts, pumps produce 0.60 to 0.70 acre-foot for each acre. For example, during the years 196 and 1947, 1 acre-foot was allotted to each acre of land and of this amount, about 0.60 acre-foot or 60 percent was supplied by pumps.

A study of this tabulation establishes clearly the uncertain supply received by gravity lands in the valley. Since a yearly application of 4 to 4.5 acre-feet of water to each acre is necessary for the raising of diversified crops, the table also shows the extent of shortage being suffered by farmers under present conditions.

PUMP LANDS

I have previously referred to a large acreage which receives its water solely from underground sources through pumping. As distinguished from the gravity lands, I shall refer to this large area as pump lands.

Except for small isolated cases, pump lands lie generally in a large compact area on the flood plain of the Santa Cruz River near the confluence of that stream with the Gila River. These lands are contiguous to the gravity lands of the San Carlos project and lie generally to the south and west of the project. Several thousands of acres of pump lands are interspersed with project lands in such manner that problems affecting one class of land, become common to the interests of all.

This community of interest extends to the vital problem now facing all agriculture in Pinal County and other parts of central Arizona and resolves itself into the question of how we are to find supplemental water.

Previous to pumping development, the ground water basin was similar to an underground lake, the water surface of which showed little change because no withdrawals occurred.

Development of lands by pumping started about 1920 and continued steadily. About 1940 it became apparent that the safe yield of the basin was being overdrawn. With the beginning of the recent war period the bringing in of new land continued at an increased rate and with the intensive crop program practiced during the past 7 years, the yearly draft on ground water has increased to such an extent that water requirements for the area now under cultivation are drawn from reserves in ground-water supply the draft being greatly in excess of the amount recharged into the ground-water reservoir.

This great area of highly developed land embraces approximately 150,000 acres. Frost occurs but rarely and the growing season extends throughout the entire year. I know of no large agricultural area which surpasses the great body of pump lands in south central Pinal County, in productivity of soil, diversity of crops and general economic value per acre, if given adequate water for irrigation.

In the years just past, when water has been generally available at economical depths, the lands have yielded exceedingly high production.

The owners of pump lands have organized their various areas into electrical districts and have bonded their lands for the construction of lines and equipment for the conveyance of electrical energy used in pumping. These organizations have proven successful and electric transmission lines now extend into all portions of the area. Approximately $2,000,000 is invested in electric distribution lines serving some 450 pumping plants. These pumping plants have motors of 50 to 150 horsepower each and produce from 1,500 to 3,000 gallons per minute from the individual wells.

CONCLUSION

A conservative estimate of the value of the developed lands, the constructed irrigation works, and the investment in homes and business districts in the towns and cities related to and dependent on the agricultural production would be $50,000,000. This total would represent farm land and improvements—$18,000,000, San Carlos project cost, $12,000,000; electrical district power lines, $2,000,000; industrial plants outside of cities and towns, $500,000; city property, $11,000,000; public utilities, $1,000,000; telephone and telegraph, $500,000; and railroads $5,000,000. I have not included here the valuation on mining properties in the northern part of the county or of the towns of Superior or Ray which are not directly related to the agricultural area.

In order to protect and preserve this development and the territory which it sustains there must be found means of supplementing and stabilizing the water supply to such an extent as will make available the water needed for irrigation. I shall not venture to say just what the existing shortage, including the overdraft on ground water, amounts to each year. It is my understanding that it has been computed at from 400,000 to 500,000 acre-feet for all of the lands now under irrigation in Pinal County alone. Whatever the figure might prove to be, it is the measure of supplemental water necessary to be brought into the area if future use is to be placed in balance with the supply. This is a portion of the water we hope to transport from the great Colorado River for use in Arizona as proposed by the bill now before your committee.

I have attempted to show the condition which must be remedied if agriculture is to survive on the San Carlos project and on this adjacent area of pump-irrigated land, and if this large and productive area is to continue to bear its important contribution to the economy of the State and Nation.

I cannot quote statistics to prove the economic values involved in maintaining the present agricultural status of our area. These will doubtless be presented by others qualified to do so. However, I am satisfied that the values involved in the preservation of highly developed agriculture on the 100,000 acres comprising lands of the San Carlos project and the additional 150,000 acres of pumped lands, a total of 250,000 acres, are tremendous. I know that the yearly contribution of these lands to the economy of the State and Nation is substantial and cannot be permitted to become lost. The welfare of some 32,000 residents of Pinal County, together with the interests of additional thousands in other portions of Arizona, is at stake.

In the past, Arizona agriculture has provided opportunity for thousands of sharecroppers, tenant farmers, and farm laborers who were forced to leave the farming areas of other States because of adverse circumstances. These, and many other thousands of persons, have settled in the farming areas in central Arizona and now constitute a large portion of the population of the State. If the bulk of the farm lands in central Arizona must go out of cultivation because the present inadequate water supply is not supplemented, what is to become of the thousands of inhabitants dependent upon the successful farming of such lands is far more than merely an Arizona problem. If such persons can no longer gain the means of livelihood in this farming area, they must move on elsewhere. The reestablishing homes and gainful occupations for them will fall on other States whose farming areas are already overburdened. The cost of providing relief for those made destitute will, no doubt, substantially increase the expenditure of State and National Governments for such purposes. This problem is obviously of such vital importance as to warrant attention and assistance by the representatives of our National Government.

There is but one source to which Arizona can look for this all-important supplemental water supply—the Colorado River. Our proper share of the waters of the Colorado will stabilize our agriculture. Unless we do obtain this water

and construct the works called for in H. R. 934 now before the committee, the economy of our entire State will suffer to a disastrous degree.

Mr. MOEUR. The next is a statement of Dean Stanley, of Phoenix, Ariz., a vegetable grower. I particularly direct the committee's attention to the fact that Mr. Stanley's statement deals with the beet seed industry, which a former witness commented on.

(The document is as follows:)

STATEMENT OF DEAN STANLEY, PHOENIX, ARIZ.

My name is Dean Stanley. I reside at 1315 West Palm Lane in Phoenix, Ariz. I have lived in Phoenix for the past 29 years. For more than 20 years past I have owned and operated irrigated farms in the Salt River Valley of central Arizona.

My lands have been rotated with the diversification of crops which can be grown in the area with particular emphasis upon such crops as the economy of the country needed. I have always endeavored to make the greatest use of available water supplies, and to maintain my soils in the highest state of fertility.

At the present time, more than one half of my farm lands are growing alfalfa and barley grain crops, all of which are used for fattening of livestock. Other crops grown on my farms, include fresh vegetables for shipment to most of the Nation's consuming markets during the winter and spring months, when similar vegetables cannot be produced in most of the other States.

These fresh vegetables are an essential part of the American food supply and a mainstay in upholding our standard of living. They are the only low cost source of the vitamins and mineral salts so necessary in maintaining the national health standard during the winter months.

The production of winter vegetable crops is an integrated, time-tested, long established industry. The central Arizona valleys, by reason of certain soil and climatic factors, fit into the schedule of winter and spring vegetable production, and are an essential cog in the machinery of steady, plentiful supplies demanded by the consumers of the Nation.

During the recent years, while we have maintained our vegetable acreage, so necessary to the Nation's agricultural economy, it has been done only with great effort, and partly at the expense of moving our production area away from the long-established irrigated district in the Salt River Valley. Much of our vegetable acreage has shifted to adjacent areas served by pumps. The extent of this shift provides a striking illustration of the lengths to which growers have been driven in the effort to maintain their production in the face of the long-continued water shortage.

In 1938 all the vegetables in central Arizona were grown with gravity water from the Roosevelt storage system. However, during the years of drought and water shortage, growers have been moving, gradually but steadily, to districts where underground water was obtainable. By 1948 27 percent of the producing acreage had shifted away from the main area of production to adjacent pumping areas. The following figures, furnished by the Arizona Fruit and Vegetable Inspection Service, illustrate how far the trend had moved by the year 1948—a trend that will have to continue as long as underground water is available, and there is a shortage of gravity water.

Percent central Arizona vegetables grown in pump areas

	1938	1948		1938	1948
	Percent	*Percent*		*Percent*	*Percent*
Broccoli	None	36.0	Cauliflower	None	41.0
Cabbage	do	37.0	Lettuce	do	22.0
Cantaloups	do	21.0			
Carrots	do	56.0	Weighted average	do	27.0

The facts and figures in attached exhibits, which I have compiled from official records of the United States Department of Agriculture, prove the importance of Arizona fresh vegetable production. They also show our part in filling the national demand, without interfering or unduly competing with other production districts.

Exhibit A shows a total of 29,543 carloads of fresh vegetables—exclusive of potatoes and onions—were produced and shipped from central Arizona during the year 1945. Comparison of central Arizona carlot shipments, with totals for the United States, are shown for different varieties of vegetables shipped during each month of 1945. This comparison shows that we supplied from 32 percent to 77 percent of the country's needs of our principal vegetable varieties during the periods of time when our production was greatest.

Exhibit B shows that our fresh vegetables were unloaded and consumed in 45 States, and 306 markets of the United States. Actual unloadings are also shown for those markets for which USDA figures were available. Total shipments and distribution of Arizona vegetables have been substantially the same during each of the last 5 years.

Another crop, which I produce each year on my central Arizona lands, makes it possible for farmers in various other States to grow millions of acres of one of the country's most important crops. This is sugar beet seed, the production of which, I, personally, pioneered back in 1935. Since that time, central Arizona has produced 78,431,874 pounds of sugar beet seed, and we have been the leading producers of this seed every year since 1936.

Since January 1, 1941, after which it was impossible to import sugar beet seed from Europe, central Arizona has produced 53,434,450 pounds. Last year in 1948, we produced 12,584,220 pounds, or nearly enough seed to meet the annual requirements of the entire sugar beet industry of the Nation,

We grow and supply practically all of the seed from which sugar beets are produced in the States of Colorado, Wyoming, Montana, Idaho, Kansas, Iowa, Minnesota, Indiana, Ohio and Michigan. We also ship our seed to California, Utah, Nebraska and most of the beet sugar producing areas of the United States and Canada. A large quantity of our seed has been exported to the European countries, since the end of the war.

In the production of sugar beet seed, a considerable amount of water is required, from 4 to 5 acre-feet, in order to produce a satisfactory crop. Since we have available, and are allotted only 2 acre-feet of water for the year 1949, in the Salt River project, it is necessary to abandon crop production of approximately one and one-half acres for each acre of sugar beet seed being produced.

Central Arizona has the soil and climatic conditions particularly well adapted to the production of sugar beet seed. Experimental crops have been grown in many other areas, but no other section of the United States has yet been found which can approach central Arizona in the number of pounds or the quality and vitality of seed produced on our farms.

The sugar consumers of the entire country—and that means all of us—and our great sugar beet industry would be placed in a very precarious position, if we farmers in central Arizona are forced to discontinue the production of sugar beet seed, because of insufficient water.

Central Arizona must have a supplemental water supply for lands that are now under cultivation. No one can dispute this fact. The only source from which this supplemental water can be obtained is the Colorado River and in order to get Colorado River water into central Arizona, we must have the approval and assistance of the United States Government. If we get that approval and assistance, a present existing civilization can be saved. If we do not get it, then the existence of that civilization is in jeopardy and the agricultural economy of central Arizona must, at least in part, fail. This failture will directly affect other agricultural communities now dependent upon Arizona for the securing of sugar beet seed and will in no small measure affect the national economy. The approval of this committee and the ultimate passage of this legislation will save us.

EXHIBIT A

Monthly carlot production of fresh vegetables (exclusive of potatoes and onions) United States and central Arizona, 1945 [1]

Mr. MOEUR. The next statement is of C. H. McKellips, a citrus grower of Mesa, Ariz. This deals with the citrus question, giving some data as to the amount of citrus grown and the necessity for water.

(The document is as follows:)

STATEMENT OF C. H. MCKELLIPS, CITRUS GROWER, MESA, ARIZ.

My name is Chauncey H. McKellips, and I live in Phoenix, Ariz. I came to Phoenix, in the Salt River Valley, in 1920, and for the last 20 years my business

has been farming, particularly the growing of citrus. Having developed during that time over 1,000 acres of citrus on raw desert land, I still own and operate about one-half of the original plantings.

I am here as a representative of the Roosevelt water conservation district, which consists of about 30,000 acres, is divided into approximately 400 farms with a farm population of over 2,000; also to tell you of the precarious position the growers of over 2,000 acres of citrus in the Salt River Valley find themselves today.

First I want to tell you about the Roosevelt conservation district with which I am most familiar, having been a member of the board of directors for over 17 years. The Roosevelt water conservation district is situated immediately east of the Salt River Valley Water Users Association project in the eastern part of Maricopa County, approximately 20 mile east of Phoenix, Ariz. The district is about 19 miles long from north to south and varies in width 2 to 6 miles. Our water supply is derived from two sources: First, its right to 5.6 percent of all the water diverted at Granite Reef Dam by the Salt River Valley Water Users Association and the balance is derived from 65 district-owned irrigation wells located along the main canal and throughout the district. All pumps are electrically powered. River water received from the association is lifted 54 feet into the district main canal for distribution through a system of laterals and sublaterals to the district's lands.

All the district power to operate our main pumping plant and the additional 65 wells is purchased from the association. The Salt River Valley watershed, in which our district is located, is subject to wet and dry cycles. During the present dry cycle this district, along with other irrigated districts in the valley, has exhausted its stored water reservoir and drawn heavily on underground water resources.

The underground water table in the entire Salt River Valley has gradually been receding in recent years due to the continued heavy pumping and lack of rainfall on the watersheds. The water table in the Roosevelt water conservation district averaged 180 feet in 1947 and the average water table last year was about 200 feet. The lack of rain and snow in the watershed and consequent reduction in river water to the district has necessitated heavier pumping from the wells and higher power costs. Pumping 1 acre-foot of river water takes approximately 80 kilowatt-hours as compared with an average of 330 kilowatt-hours for pumping 1 acre-foot from the district wells.

The power production of the association has been insufficient to meet the demands of its contracts for several years past. This has greatly handicapped our district. In the year 1947 the district received power cuts totaling 13 days, thereby reducing deliveries by 6,000 acre-feet. During part of last year we were restricted to 72 percent of our power load. Also, in addition to the power and water shortage, the cost of power has been increased from an average of 7½ mills in 1947 to approximately 9½ mills for 1948. With this extra cost of power, along with practically all of our water being pumped from our own wells, the district was compelled to charge $6 per acre-foot for water as against a charge of $3.60 per acre-foot in 1947, or approximately double.

This excessive charge of $6 per acre-foot for water caused by the drought and power shortage is heading every one of our farmers into serious difficulties. There is only one answer, and that is we must have a supplementary supply of water from the Colorado River or eventually go out of business.

In 1943 our water use was as follows:

	Acre-feet
Stored water from the reservoirs	54,070
From the district wells	100,822
Total	154,892

of which 121,253 acre-feet was delivered to 30,000 acres, or 4 acre-feet per acre.

Since 1943 our water supply has gone down steadily so in the year 1948 only 19,983 acre-feet was received from the reservoir and 107,782 acre-feet from the district wells, which meant only 96,000 acre-feet total was delivered to 34,350 acres of land in cultivation last year, or only 2.7 acre-feet per acre. For full production we must have 5 acre-feet per acre for approximately 75 percent of our district lands and 5 acre-feet per acre for the balance for such crops as citrus fruits, alfalfa, and specialized crops.

91190—49—ser. 11, pt. 1——15

The following census for the crop year 1947–48 shows a diversification of farming in the Roosevelt water conservation district and what this district of only 30,000 acres in production added to the national income that year:

Roosevelt Water Conservation District census, crop year, 1947–48

Kind of crop	Acreage	Unit	Yield total	Total value
Alfalfa grain	1,450	Ton	2,175	$34,800.00
Alfalfa (after grain)	12,778	do	51,112	1,124,464.00
Barley	3,356	Bushel	255,727.2	250,612.66
Oats	154	do	10,164	10,164.00
Wheat	76	do	2,597.6	4,545.80
Hegari and maize	5,277	do	263,850	440,629.50
Hay and forage	103	Ton	206	2,844.00
Vegetables	500	Acre [1]		175,000.00
Oranges	1,779	Pound	19,587,400	685,559.00
Grapefruit	1,498	do	37,035,000	166,657.50
Cotton	1,184	Bale	1,184	201,280.00
Miscellaneous	131			
Flax	1,099	Bushel	27,475	192,325.00
Pasture	316	Acre		6,320.00
Total	29,793			3,295,200.96

[1] Estimated.

I now want to tell you about the citrus industry of the Salt River Valley and what it means to the economy of the State. The citrus industry here consists mostly of oranges and grapefruit, with some lemons. We have been growing citrus in the Salt River Valley for the past 40 years and represent investments of approximately $25,000,000 and the livelihood of approximately 2,000 families on a total of about 23,000 acres of land.

No group of people is harder hit than the citrus growers, for with the average water supply barely two acre-feet per acre per year for central Arizona, he can barely keep his trees alive, much less produce a crop. A citrus grower must have not less than four acre-feet of water per acre per year and should have five to insure a fair return on his large investment. An annual gross income averaging $12,000,000 is simply going to pot if the supplementary water from the Colorado River is not forthcoming, and it must be available not too far in the future. There is simply no way that the citrus industry can survive with the present inadequate water supply, and it would not only be an Arizona catastrophe, but to a certain extent would affect our national economy.

Railroads alone would lose approximately $5,000,000 per year revenue, besides many other industries such as the fertilizer industry, the lumber industry, etc., would feel the effect of this loss of revenue which the citrus industry produces. This condition cannot continue indefinitely and the economy of central Arizona be preserved. I also want to impress on you the fact the central Arizona project, which we must have, is a 100 percent supplementary supply of water for a district second to none in production per acre and value in the whole United States. This is not to bring in new land, but to protect and preserve the economy of the whole State of Arizona.

Another agricultural industry that is now in its infancy is also worthy of comment, and that is the date industry. I have gathered some data concerned that particular industry which I desire to present to the committee.

There is, at this time, planted to dates in Arizona, approximately 550 acres. This is an expensive development involving a long-term investment in producing property and a heavy investment in specialized processing, packing and selling operations.

Dates contain a high food value. An acre of dates produces three times the calories produced by an acre of wheat. The labor pay rolls in connection with the operation and maintenance of the date groves are many times greater than most other agricultural productions in the same area. Arizona produces a fine quality of dates; in fact, one of the finest known in the world. The United States Government has been intensely interested in this development and has maintained experimental stations in Arizona and California.

A good yield of 7,000 pounds per acre means that central Arizona has a potential annual production of almost 8,000,000 pounds of marketable dates. This is equal to 2,000,000 pounds of natural fruit sugar. Approximately half of the total

planting in this area has not yet reached maturity. The current production of groves now in existence should be close to 2,000,000 pounds per year and when all the groves have reached maturity, the potential production of 8,000,000 pounds per year above mentioned should be reached. Actually, the normal production now is closer to 1,250,000 pounds per year. This discrepancy of more than 500,000 pounds per year of present production is occasioned to some extent by inefficient grove management and inefficient fertilizing, but largely to insufficient irrigation. We are not getting enough water for our groves, and since date palms are able to store up a considerable quantity of water through short drought periods, the consequence of a shortage may not yet be fully apparent.

It is evident, however, that due to shortage of water, our young palms are not enjoying normal growth and our bearing palms are seriously deficient not only in quantity of production, but also in quality.

Dates require a lot of water. The minimum amount for normal production should be between 4 and 5 acre-feet per acre, and more than that amount can be beneficially used, particularly where the soil is sandy. Most of the developed acreage in dates in central Arizona is within the Salt River Valley Water Users Association project. Land under that project, for the last 2 years, has been allotted less than 2 acre-feet of water per acre per year. Some of the acreage in dates receive supplemental irrigation water from private wells, but only to a limited extent. Many owners of date orchards do not have the necessary finances to put down private wells and the future prospect for well water is further dimmed by the consistent lowering of the underground water table in this area, due to the excessive pumping. It has been estimated that, by doubling his present allotment of water, a date grower could increase his production by as much as 80 percent.

However, the need for supplemental water for this industry is not merely one for increased production, but it is a case of actual survival, horticulturally and financially. This industry and the citrus industry are two that cannot survive without supplemental water for the groves and orchards now in existence.

Mr. MOEUR. The next statement is of R. J. Hight, of Tempe, Ariz., who is vice president of the Salt River Valley Water Users' Association, and a farmer.

(The document is as follows:)

STATEMENT OF R. J. HIGHT, TEMPE, ARIZ.

Mr. Chairman, and members of the committee, my name is R. J. Hight. I live in Tempe, Ariz. I am vice president of the Salt River Valley Water Users' Association. I have owned and operated farms in Arizona, principally in Maricopa County, for 34 years. I have recently acquired an interest in a cattle ranch in the northern part of the State in what is known as the Payson country. My farming operations have been chiefly confined to the livestock branch, that is, dairying and raising and feeding cattle for the market.

I want to present to you some of the ways the proposed legislation will affect agriculture in the State of Arizona.

Arizona is a big State. In fact, it is the fifth largest State in the Union, with a total area of over 73,000,000 acres. A large portion of the State, on account of insufficient rainfall and lack of water for irrigation, is not suited for agriculture. Some of this is wasteland, some producing grass for grazing of livestock, and in the higher elevations where rainfall is more plentiful, some timber and a very limited amount of so-called dry farming; that is, farming without the aid of irrigation. Over 80 percent of the State is owned and administered by Federal agencies. Actually, in the entire State, there are only 775,000 acres of irrigated land. This includes some small developments in various parts of the State, but the principal portion lies in Yuma, Maricopa, Pinal, and Graham Counties.

In speaking of the central Arizona area, we refer to the area under irrigation in Maricopa, Pinal, Graham, and Greenlee Counties, which comprise about 670,00 acres. This agricultural area is the backbone of the whole State. It is the principal industry of the State. The economy of the State depends largely upon the success of the farmers of this area. They support the business of the State, the schools, pay the taxes, and build the roads. The land included in this area is extremely fertile in character and, with ample water for irrigation, produces crops of great value.

The Arizona FB Federation, which is affiliated with the American FB Federation, of course, extends to all farming areas as well as representing the livestock interests of the State. With such a coverage, we are representing growers and livestock men in every county of the State. The Arizona FB Federation is a federation of county units. At the present time; this organization represents over 2,000 farm families and, naturally, is in close touch with the man who is on the land.

The proposed legislation, which contemplates bringing supplemental water into Arizona, is most important to the over-all economy of the State, which includes business and industry, as well as agriculture. If agriculture fails, businessmen likewise must fail. If agriculture fails to pay its taxes, the State, county and local governmental agencies cannot meet their obligations. The entire business of the State is paralyzed, people will be thrown out of work and on relief. This is not a pleasing picture, but it is the actual situation. It is of primary importance that this agricultural development be maintained and stabilized.

Because of geographical features of the State, during the summer months, under normal conditions, there is generally considerable forage for livestock in the higher elevations. During the winter months, however, it is necessary to move this livestock to the lower valleys for sufficient feed. This livestock is, to a large extent, fed in central Arizona, hence the livestock folks who operate on Federal land are vitally interested in this legislation.

Previous witnesses have presented to you the necessity for supplemental water supply. It so happens that we have developed more land in central Arizona than we can till with the available water, either surface or underground, and all interior water that is available has been fully developed. Unless we get supplemental water for this land now under cultivation, it is a foregone conclusion that a part of it will revert to the desert and that, gentlemen, is a very painful process.

I know from my own experience what it means to farm in central Arizona with a short water supply. My wife and I now own something in the neighborhood of 320 acres, located in the Salt River Valley Water User's project. I have a son-in-law associated with me in my farming operations and we have, under lease, some additional acreage, some located within the boundaries of the Salt River Valley Water User's project, and some outside the project. On this land we are farming, we are raising almost entirely grain and feed for livestock. In fact, this year all the acreage we are farming is planted in that crop except for a very small acreage which is planted to flax, with which we are more or less experimenting at this time. We sell some grain and hay, but we feed a large part of what we raise to livestock.

This year the allotment of water under the Salt River Valley Water User's Association was two acre-feet per acre, and you cannot successfully farm in that locality on that amount of water. We need at least four acre-feet per acre to do a decent job of farming and, for alfalfa, we could use five to six acre-feet per acre, to get the best results.

The situation we are faced with now means that approximately one-half of our land is laying idle and our expenses are not decreasing any way near by half. As a matter of fact, we have an investment in equipment to farm our entire acreage and, of course, we pay taxes and water assessments on the entire acreage and on the land that we rent, we pay rent on the entire acreage, so the result is that our actual expenses have decreased little, if any, but our returns are cut approximately in half. We cannot continue indefinitely with this situation. The Salt River Valley Water User's Association is one of the best projects in the State, and other farmers are in a worse shape than we are in. Our very economic existence is at stake. We need this water and we need it badly. We need it to supplement the supply of water we now have for land that is now under cultivation. We need it for our own protection and we need it in order that we may continue to supply badly needed foodstuffs for the Nation and the world at large.

There is no place to get the water except from the Colorado River. We cannot continue to produce food and fiber on the limited amount of water that is now available. We are faced with a very serious problem. I would like to make this point clear, that we are not asking for this supplemental water to develop new lands, but merely to supplement the supply used on the already developed acreage.

The detailed testimony of experts will clearly demonstrate the economic feasibility of this central Arizona project. We are not asking for a gift—we are merely

asking the United States Government to make an investment that will protect the existing investments and economy of this area. It is expected that this investment will be repaid to the Government by water and power that will be developed.

It goes without saying, that such an investment will result in stabilizing the existing economy of our region. By so stabilizing the economy of the State, we will be able to continue to produce foodstuffs and do our share in stabilizing the economy of the United States.

Mr. MOEUR. The next is the statement of Nat M. Dysart, vice president and manager of the Arizona Milk Producers, Phoenix, Ariz., and the statement deals with the milk industry, or dairy industry.

(The document is as follows:)

STATEMENT OF NAT M. DYSART, VICE PRESIDENT AND MANAGER ARIZONA MILK PRODUCERS, PHOENIX, ARIZ., BEFORE HOUSE COMMITTEE ON PUBLIC LANDS

My name is Nat M. Dysart. I have owned and operated farms near Phoenix for something more than 40 years last past. During most of that time I have operated a dairy in connection with other farming operations.

In 1913 I moved on to, and started the development of, a tract of 640 acres of desert land about 22 miles northwest of Phoenix in the Agua Fria River Basin. My brother was interested with me in this development. Since then I have sold a part of my original land and I now own, and live on, 320 acres of the original 640.

On that 320 acres I have, in the past, operated a dairy. On that ranch I have a small area in citrus, I have leased a part to vegetable growers and on the balance I am raising grain crops, grain, alfalfa, etc., and livestock.

The water supply for the irrigation of this farm is obtained by pumping from wells. In 1913, until about 1926, ample supplies of water could be obtained with a pump lift not exceeding 90 feet. Since 1926 the underground water table has been receding and the lift now required to secure this water is approximatly 162 feet. Pumping costs are, of course, proportional to the depth from which water is lifted and with the water level continuing to recede it follows that in a matter of a few years this operation will become uneconomical due to prohibitive pumping costs or, perhaps, complete exhaustion of the underground water supply.

During the time I carried on dairy operations, employment was furnished to some 5 or 6 people. Since a part of the land is being farmed for vegetables this number is greatly increased. The farm represents an investment in excess of $75,000. A 14-room school has been built on a part of this farm. Over 500 pupils attend this school. These pupils come from the surrounding farm area, the lands of which situated similar to my own with respect to water supply. The school property represents an investment of probably $80,000 and gives employment to about 20 people.

Since 1942 I have been vice president and manager of the Arizona Milk Producers, a cooperative marketing association representing, now, about 750 dairy farmers who, last year, marketed milk and butter fat with a farm value in excess of $2,000,000, and that value is steadily increasing. Arizona is a deficit area in milk production. The total population of Arizona now is in excess of 700,000 people and in the State there are only about 45,000 dairy cows, or 1 cow for each 15 people, compared to a ratio of 1 to 5 or 6 nationally. Because of the geographic situation no fluid milk is imported into the State, so the local production must be relied upon to supply fluid milk and cream and this supplies more than one-half of the State's production. The other half is used, in a large part, for the making of ice cream, soft cheese and butter, and other dairy products. This production is not sufficient to meet the demand of the residents of the State. This is particularly true with reference to the butter production. Most of the State's requirements of evaporated and condensed milk, cheese, and butter must be met from sources outside the State. The State's dairy industry is, therefore, in no way competitive with milk production in other parts of the country. On the contrary, the State has forged a good market for surplus dairy supplies from other States.

At least three-fourths of the dairy farming in the State is carried on in the irrigated valleys of central Arizona and most of the dairies operated in nonirrigated areas are entirely dependent on forage and grain feeds grown in the irrigated areas. Successful dairy operation is particularly dependent upon ade-

quate and continual supplies of irrigation water. While acreages planted to crops such as grain, vegetables or cotton may, to some degree, be adjusted in accordance with available water supplies, the dairy farmer cannot adjust his operations. If a dairy farmer is equipped to handle 30 cows, and water shortage forces the operator to dispose of 10 or 15 of them, the whole operation has become uneconomical and the dairyman cannot readily replace cows when normal water supplies return. Dairy farming and the establishments engaged in the distribution of milk and milk products, give steady and remunerative employment to a great many people. The industry is a heavy user of supplies and equipment. The dairy industry is one of the most sound of farming operations. When the prices of other crops fall below the cost of production, the farmer with a few cows can always sell his milk and at least feed his family and keep his farm going. A small dairy has saved more than one farm on lots of occasions.

Dairy farms and processing plants are substantial users of electric power. Power is used for the pumping of water, refrigeration purposes, operation of milking machines, and other similar purposes. The farm value of dairy products produced in the State last year was in excess of $8,000,000, with a manufactured value in excess of $12,000,000. The industry lends stability and strength to the economy of the State, and makes more certain the ability of the water users to meet any obligation assumed for the purpose of bringing in supplemental water to central Arizona.

For the irrigation of our land in Arizona, we need a minimum of 4 acre-feet per acre per year. Our present supply is far below that mark. This year, under Salt River Valley water user's project, it was 2 acre-feet per acre for the year. Those firms that depend entirely on pumping, such as mining, have been curtailed in the use of power for pumping irrigation water. This curtailment, at one time, was 2 days per week.

Our underground water supply is being rapidly depleted. If we are to continue, we must have supplemental water, and the only place that we can get that water is from the Colorado River. It is for that reason that the dairy farmers of central Arizona join with the other farmers and interested businessmen in support of the legislation now pending before your committee. We know that it is absolutely necessary for the continued success of our business that we get this water in central Arizona.

We, therefore, urge that H. R. 934 be given favorable consideration by your committee.

Mr. MOEUR. The next is a statement of Mr. R. H. McElhaney of Wellton, Ariz.

Is Mr. McElhaney here? He is in town. It is a general statement. Mr. McElhaney is from the Wellton district.

(The document is as follows:)

STATEMENT OF R. H. MCELHANEY, WELLTON, ARIZ.

My name is R. H. McElhaney, and I am a farm owner and operator living near Wellton, Ariz. I am president of the Gila Valley power district; vice chairman of the Arizona Interstate Stream Commission; vice president of the Yuma County Farmers Marketing Association; a member of the land examining board of the Bureau of Reclamation for settlement of veterans on publicly owned land developed by the Bureau of Reclamation in Yuma County, Ariz.; a member of the board of directors of the Gila Project Association; and president of the Wellton Mohawk Valley Kiwanis Club.

The early construction of the central Arizona project to bring main stream Colorado River water to the lands of central Arizona which are now short of irrigation water is of the utmost importance to the entire State of Arizona. The entire economy of Arizona is so closely tied together, that anything that affects the economy of any major portion of our State affects the economy of the whole State.

As has been clearly shown by previous witnesses, a very considerable portion of the irrigated agriculture in Maricopa, Pinal, and Graham Counties in Arizona that has been in a high state of cultivation is not now being farmed, or is seriously handicapped by a shortage of water supply, with a consequent reduction in crop production. This loss of farm income, of course, affects the taxpaying ability of the people concerned and this loss of tax revenue seriously affects our

State income and also causes a loss of revenue to the Federal Government as well. Our State highway construction and maintenance programs as well as our entire State school system are adversely affected by any loss of State tax revenues. Many other functions of the State are likewise adversely affected by any loss of tax income.

Our mining, forest, and vast livestock industries are very closely tied in with our irrigated agriculture. Arizona is not now, and probably never will be, self-sustaining from an agricultural production standpoint. Our mine and forest workers need the farm products these acres of land now idle, or only partially productive, could produce if a sufficient supply of water was available. They need these products now, and will need them in everincreasing quantities as time goes on.

Hay, grain, and pasture grown on our irrigated land supplies cattle and sheep men with feed necessary to finish their animals for market and supplies sheep flocks with a place to winter away from the high elevations of the State where their summer ranges are located. All ewes are brought from these high summer ranges to the lower valleys for lambing. Central Arizona provides an ideal place for lambs to be born. The warm winters and low rainfall, together with an abundance of green feed, make it possible to lamb large flocks with small loss and the lambs can then be finished and shipped direct to market. All sheep are sheared before being returned to their summer pastures. The ability of our valleys to supply finishing and winter feed for livestock is one of the most important factors in successful production of beef and mutton in Arizona and any reduction of irrigated agriculture anywhere in the State adversely affects these very important industries.

During the last war, several hundred thousand men did all, or a part, of their military training in Arizona. Now thousands of them are returning to Arizona to establish their homes. As evidence of this desire to own a home and farm in Arizona, more than 1,500 veterans applied for the 82 developed farm units made available by the Bureau of Reclamation in Yuma County, Ariz., this year. Some veterans now own homes and farms that are being affected by the water shortage in central Arizona. Many thousands more will come to this State to make their homes when Arizona gets her just share of Colorado River water.

National defense is also directly connected with early and complete development of Arizona's Colorado River water. Should the world become involved in another world war, without doubt, there would be widespread dispersal of population and industry, now somewhat concentrated in coastal areas, and therefore more vulnerable to attack than these same populations and industries would be if they were located farther inland and spread over much wider areas. Arizona offers an ideal place for many industries and large populations to be as safely located as anywhere in our Nation. The well-being and economic stability of these people and enterprise would be vitally affected if an improper disposition was made of the waters of the Colorado River. It would seem prudent, therefore, from a military standpoint, to make use of as much Colorado River water in Arizona as possible.

My connection with the passage by the Eightieth Congress of Public Law No. 272 which sets up the Wellton Mohawk division of the Gila Federal reclamation project has given me an opportunity to come in contact with many people over the entire State and I can state with assurance that the State is united in its desire to have the central Arizona project completed at the earliest possible date. Failure to receive authority to construct this vitally needed project will so affect the econmy of the entire State that its progress will be retarded far beyond any future which any of us here now can foresee.

May I thank you, gentlemen, for your consideration.

Mr. MOEUR. Those are all the statements, Mr. Chairman.

Mr. MORRIS. Thank you very much, Mr. Moeur.

Mr. MOEUR. I may have a statement that I want to make later on, but now I do not care to make a statement.

Mr. MORRIS. Very well.

According to the schedule which Mr. Murdock asked me to follow as a temporary chairman during his absence, I understand at this time we will call on Mr. Engle of California, one of our colleagues, for a statement.

Mr. Engle, are you ready to make your statement at this time?

Mr. ENGLE. Mr. Chairman, I have a statement which I would like to make, but I would like to make it to a quorum of the committee. I think it is implicit in any agreement made with respect to the statement that it shall be made to a quorum of the committee. I am not raising the point now that the quorum is not present, although I reserve the right to do so.

Mr. MORRIS. I think you are entitled to make your statement in the manner suggested, so we will call on someone else at this time.

Mr. Wingfield, I understand that you have a statement. We would be glad to hear from you at this time.

Please give your name and the representative capacity, if any, in which you appear, for the benefit of the record and the committee.

STATEMENT OF K. S. WINGFIELD, ENGINEERING CONSULTANT TO THE ARIZONA POWER AUTHORITY

Mr. WINGFIELD. My name is K. S. Wingfield. I am a graduate in electrical and mechanical engineering and I have had better than 25 years' experience in the electric power field. During the course of my experience, I have had occasion to make numerous surveys and economic studies of power generation, both steam and hydro, together with market analyses, rate studies and investigations of proposed transmission line interconnections. For the past 8 years I have conducted a consulting engineering business with headquarters at Washington, D. C. During the last 4 years of that period I have been acting as constultant on electric power matters for several of the irrigation and the electric districts in central Arizona, as well as for the Arizona power authority, although for the past year the work of the power authority has required almost my full time. Just prior to undertaking these assignments in Arizona, I took leave of absence from my consulting engineering firm and was chief of the Branch of Marketing and Operations of the Power Division of the Department of the Interior for a period of 18 months. While in such capacity, I became familiar with the operations of the Bureau of Reclamation and the program of development for the Colorado River Basin.

The development of the Colorado River in the lower basin has always contemplated the sale of a considerable block of electricity in southern California. This has been true because, until recent years, southern California constituted the principal nearby market. This has also been true because electricity generated at Bridge Canyon and other Colorado River developments will probably represent to southern California markets the cheapest sources for large blocks of electric power, if considered over the long term. However, the rapid growth in the use of power in Arizona and its outlook for large demands for power in the future have decreased the importance of the southern California market to the development of the Colorado River.

In analyzing power markets, power sources, and probable costs, many factors must be considered, assumptions must be made, and future conditions anticipated or predicted. These elements of opinion make

it impossible to reduce such analyses to exact mathematical comparison. However, it would appear that the probable outlook for higher costs of power generation in both Arizona and southern California indicates a market demand for all available energy that can be delivered from the Bridge Canyon hydroelectric power plant.

The Bureau of Reclamation's December 1947, report on the central Arizona project states that the Bridge Canyon power plant should be able to deliver annually to load centers an average of 2,679,000,000 kilowatt-hours of firm power. This represents energy available over and above that required by the project for water pumping and is the average over a 78-year period of repayment. The Bureau further states in its report that such power should be delivered at the load centers at charges estimated at 4.82 mills per kilowatt-hour. Should the 78-year period of repayment not be established, the Bureau estimates that Bridge Canyon power could be delivered at the load centers for not to exceed 6.22 mills per kilowatt-hour.

I have made no study of these estimates of the Bureau, but have only attempted, in the following statement, to present estimates of the probable costs of generation in the Phoenix and Los Angeles areas of power that might be used in lieu of Bridge Canyon power. Following which, estimates were presented that show the effect on the market for Bridge Canyon power, as a result of the constantly increasing demands within Arizona itself.

Steam-electric generation has been assumed to represent the best criterion of market price for replacement for hydro-electric energy developed at multipurpose projects having a long-term useful life such as hypdroelectric power generated at Bridge Canyon. In a report which the Federal Power Commission is preparing entitled "Colorado River Power Market Survey—Lower Basin" the following statement is made:

> The natural gas reserves are being rapidly depleted and a pipe line is now being laid to bring gas from the Texas and New Mexico fields to southern California. All natural gas used in Arizona at the present time is obtained from fields in New Mexico. In the past natural gas, as well as oil, has been used for fuel in steam-electric generating plants in the area, natural gas being used during months when the demand for gas was "off peak." Due to the diminishing gas supply in the region and the increased use for domestic and industrial purposes, which has necessitated transporting additional gas into the region, it cannot be considered as a dependable source of fuel for steam-electric plants in the future. In view of these facts, the costs of steam-electric generating plants shown in this study are based on oil-burning equipment.

In estimating the probable cost of steam-electric generation for comparison with the range of estimated costs of Bridge Canyon power delivered, the principal cost factor will be the price of fuel at Los Angeles, or at Phoenix. As the long term outlook for continued output of natural gas is stated by the Federal Power Commission to be not dependable, cost estimates are submitted below based on the present prices of oil at $2 per barrel for tank car delivery at Los Angeles and $3.45 per barrel for tank car delivery at Phoenix. Also, large steam-electric generating plants designed to burn oil initially should be changeable to coal for the longer term. Indications are that coal would be higher than oil on an equivalent heat unit basis, as it would have to be shipped into either California or Arizona from fields outside of either State.

Under the present outlook for cost of labor and materials, a large steam-electric generating plant consisting of 50,000 kilowatt units, using 1,250 pounds per square inch steam pressure, with boilers and building designed for oil as fuel but changeable to coal, condensing water without cooling towers, simple architecture and finish, and not including transformers, switching or transmission, could probably not be constructed for an average cost of less than $130 per kilowatt of capacity.

This investment would be subject to fixed charges of interest, amortization or depreciation, taxes, insurance and administration. As interest rates and taxes (or tax equivalents) would vary as between private and municipal financing, fixed charges have been estimated on the basis of 5 percent interest for private financing and 3 percent interest for municipal. After giving effect to the useful life of various portions of the plant, the weighted average annual rates for interest and amortization have been estimated at 6.47 and 4.99 percent respectively. Adding the estimated rates for the other items included in fixed charges results in the following:

The fixed-charge rates under private financing at 5 percent interest and municipal financing at 3 percent interest are respectively:

Interest and amortization, 6.47 and 4.99 percent.

Local taxes, 1.5 percent, with no local taxes under the municipal financing.

Contributions in lieu of taxes, none under the private financing with 2.5 percent under the municipal financing.

Federal income-tax equivalent, which is relating the income taxes to a fixed charge, is 1.64 percent under private financing. I might say that was based on an average charge of 32 percent annually.

Insurance and administration is 0.5 percent in either case, making a total fixed charge rate of 10.11 percent for private financing and 7.99 percent for municipal financing.

Assuming operation of the steam plant at 5,000 hours annual use, burning oil for fuel having 6,200,000 B. t. u. per barrel with a plant efficiency of 11,000 B. t. u. per kilowatt-hour produced, the annual at-site cost of steam-electric power is estimated as follows:

For a plant at Los Angeles, the private and municipal cost.

This is the annual cost.

The fixed charges per kilowatt are $13.15 for private and $10.38 for municipal, with no charges on the kilowatt-hour cost.

For fuel oil, assuming a plant use of 9,000,000 B. t. u., it would run $2.91 per kilowatt for private and 3.55 mills per kilowatt-hour; and $2.91 for municipal per kilowatt and 3.55 mills per kilowatt-hour.

For supervision, engineering, labor, water, supplies, and maintenance, it would run $3.30 per kilowatt for private, with 0.2 mills per kilowatt-hour; and $3.30 per kilowatt for municipal, with 0.22 mills per kilowatt-hour.

These result in a total of $19.36 per kilowatt and 3.75 mills per kilowatt-hour for private; and $16.89 per kilowatt for municipal and 3.77 mills per kilowatt-hour; which, when converted to kilowatt-hours on 5,000 hours use, would result in a total energy cost for private of 7.62 mills, and for municipal of 7.15 mills.

Fixed charge rates	Private financing, 5-percent interest	Municipal financing, 3-percent interest
	Percent	*Percent*
Interest and amortization	6.47	4.99
Local taxes	1.50	
Contributions in lieu of taxes		2.50
Federal income-tax equivalent	1.64	
Insurance and administration	.50	.50
Total fixed charge rates	10.11	7.99

Assuming operation of the steam plant at 5,000 hours annual use, burning oil for fuel having 6,200,000 B. t. u. per barrel with a plant efficiency of 11,000 B. t. u. per kilowatt-hour produced, the annual at-site cost of steam-electric power is estimated as follows:

Plant at Los Angeles

Annual costs	Private		Municipal	
	Per kilowatt in dollars	Per kilowatt-hour in mills	Per kilowatt in dollars	Per kilowatt-hour in mills
Fixed charges	13.15	0	10.38	0
Fuel oil (plant use 9.0 million B. t. u.)	2.91	3.55	2.91	3.55
Supervision, engineering, labor, water, supplies, and maintenance	3.30	.20	3.30	.22
Total	19.36	3.75	16.89	3.77
Kilowatt costs converted to cost per kilowatt-hour at 5,000 hours' use		3.87		3.38
Total energy cost		7.62		7.15

The increased cost of fuel oil delivered at Phoenix would increase the estimate for the annual at-site cost of steam-electric power at Phoenix to 10.59 mills per kilowatt-hour with private financing and 10.10 mills per kilowatt-hour with municipal financing. The Federal Power Commission, in its power market survey referred to above, estimates that production from comparable plants in the southern California area and in the central Arizona area would cost 7.40 mills per kilowatt-hour and 8.23 mills per kilowatt-hour, respectively. Any of these estimates are well above the probable cost of Bridge Canyon power of 4.82 mills per kilowatt-hour, as estimated by the Bureau of Reclamation. They also exceed the maximum cost of 6.22 mills per kilowatt-hour estimated by the Bureau for Bridge Canyon power under the requirements of the existing reclamation law.

Thus, it would seem reasonable to assume that both the southern California and the Arizona markets have at-site costs of generation over the long term, which will result in each market absorbing, to the extent possible, the Bridge Canyon power made available to it. As the Arizona market is the nearest large market and as the Bridge Canyon project lies wholly within that State, it also seems reasonable that Bridge Canyon power will be delivered to the Arizona market to the extent of that market's capacity to absorb it. The balance, if any, would be delivered to southern California, or such other markets as may be available.

The electrical producers, distributors, and consumers in the State

of Arizona are united in their desire that the Bridge Canyon project be completed at the earliest date, including the transmission lines needed to make the power available to the market centers. These producers, distributors, and consumers embrace both public and private interests, both industry and agriculture, both urban and rural populations. They are all in agreement that Arizona's welfare depends upon the rapid and continued development of the Colorado River as a source of both power and water. Within the past 10 years Arizona has had repeated power shortages, often requiring rationing of power. Some of these shortages have resulted in losses to agriculture and industry running into millions of dollars. Arizona has never had sufficient electric power.

The Arizona Power Authority is a public corporation and agency of the State of Arizona charged with administering and making avilable to the citizens and residents of that State electric power and energy generated at public works on the Colorado River. These developments along the river have already been undertaken by the Federal Government with Hoover and Parker Dams already completed and Davis Dam under construction. The Federal Government now owns all of the major transmission lines within Arizona and has started building extensions and supplemental lines to that system. For the Arizona Power Authority, or any other agency, to attempt construction of works along the Colorado River, or major transmission lines within Arizona, would introduce duplication of facilities and consequent conflicts would delay their completion, which has been heretofore avoided. If Arizona is to avoid power shortages in the future, Bridge Canyon and other developments along the Colorado River, together with the necessary transmission lines, must be completed as early as possible.

Attached is a chart showing the results of a State-wide power market survey recently completed by the Arizona Power Authority. This shows that the consumption of electricity within Arizona during 1940 and 1941 was about 1,050,000,000 kilowatt-hours. In those years no power was available to Arizona from the Colorado River developments, except a small amount purchased through the metropolitan water district of southern California. During those 2 years power was so short that it had to be rationed in certain areas. Then in 1942 the use of electricity in the State rose to nearly 1,500,000,000 kilowatt-hours. This was made possible by the availability of power which resulted from the large run-off in the Salt River drainage basin filling the reservoirs along that river.

Beginning with 1943, power was delivered at Arizona load centers by the Bureau of Reclamation following completion of Parker Dam. With availability of power, the use in Arizona rose to nearly 1,800,000,000 kilowatt-hours for that year. Then, through 1946, consumption in the State remained slightly over 1,800,000,000 kilowatt-hours annually due to wartime conditions. During this period declining production from the Salt River power plants, and from the generating plants of the mines and mills, was offset by heavy wartime operations at Hoover with consequent increased production at Parker, together with some purchases of energy from California.

During 1947 and 1948 the demands for power in Arizona increased sharply, with the 1948 consumption nearly reaching 2,700,000,000

kilowatt-hours. This large increase was provided for by the use of practically every generating unit in Arizona which could be operated and kept on the line, and by purchasing energy from California to the extent existing facilities would permit its delivery. Due to shortages of electrical equipment and the long time required for delivery of such facilities, it was impossible to meet such rapid growth by installation of additional generators. One new generator of 30,000 kilowatt capacity did go into service at Phoenix about the middle of 1948. Despite all efforts to meet the demands for power in those 2 years, however, power had to be rationed and such rationing is continuing into the present year.

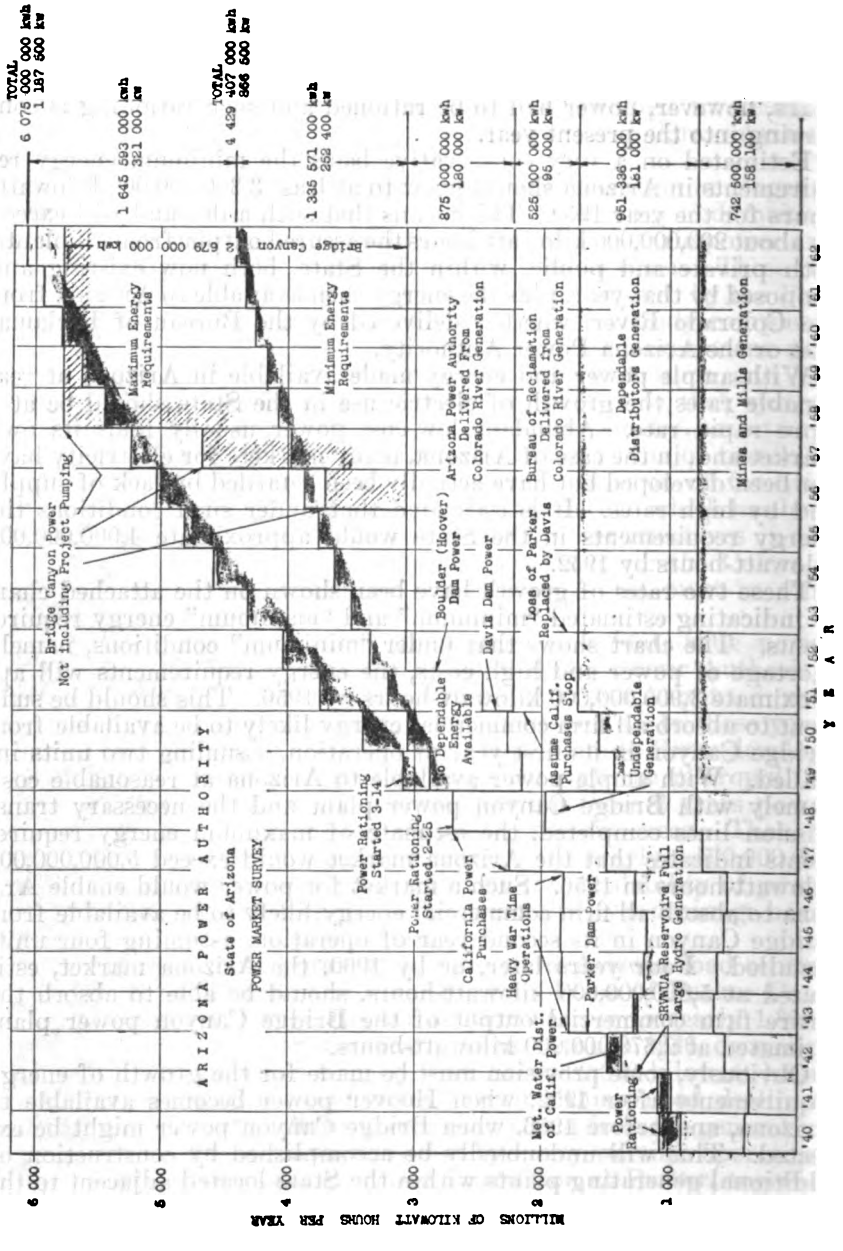
Estimated on a very conservative basis the minimum energy requirements in Arizona should grow to at least 3,300,000,000 kilowatt-hours for the year 1952. This means that such a demand will exceed by about 200,000,000 kilowatt-hours the assured output from all plants, both private and public, within the State, both now existing and proposed by that year, plus the energy then available to Arizona from the Colorado River, whether delivered by the Bureau of Reclamation or the Arizona Power Authority.

With ample power and energy made available in Arizona at reasonable rates the growth of electric use in the State should be at a more rapid rate. Abundant low-cost power usually finds its own market and, in the case of Arizona, many markets for electricity have not been developed but have actually been retarded by lack of supply and by high rates. It is estimated that under such conditions the energy requirements in the State would approximate 4,000,000,000 kilowatt-hours by 1952.

These two rates of growth have been shown on the attached chart as indicating estimated "minimum" and "maximum" energy requirements. The chart shows that under "minimum" conditions, namely shortage of power and high costs, the energy requirements will approximate 3,900,000,000 kilowatt-hours by 1956. This should be sufficient to absorb all firm commercial energy likely to be available from Bridge Canyon in its first year of operation, assuming two units installed. With ample power available to Arizona at reasonable cost, namely with Bridge Canyon power plant and the necessary transmission lines completed, the estimate of maximum energy requirements indicates that the Arizona market would exceed 5,000,000,000 kilowatt-hours in 1956. Such a market for power would enable Arizona to absorb all firm commercial energy likely to be available from Bridge Canyon in its second year of operation, assuming four units installed. Four years later, or by 1960, the Arizona market, estimated at 5,800,000,000 kilowatt-hours, should be able to absorb the entire firm commercial output of the Bridge Canyon power plant estimated at 2,679,000,000 kilowatt-hours.

Obviously, some provision must be made for the growth of energy requirements after 1952, when Hoover power becomes available to Arizona, and before 1956, when Bridge Canyon power might be expected. This will undoubtedly be accomplished by construction of additional generating plants within the State located adjacent to the market centers. Such plants are needed, along with the hydroelectric developments on the Colorado River, to assure Arizona of adequate power reserves and proper protection and regulation for the network

of transmission lines interconnecting the generating plants and the market centers. The Arizona Power Authority, in conjunction with other distributors and users in the State, proposes to see that such need is met and looks to the Federal Government to continue its development of the Colorado River to meet the needs of the area.



Mr. MURDOCK. Mr. Wingfield, I regret to say a sad occurrence has happened, and we must discontinue with your testimony.

We thank you for this presentation, and appreciate your courtesy.

Mr. WINGFIELD. Yes, sir.

Mr. MURDOCK. In view of the fact that you have been away from your task for some time, the record will speak for itself; and we will not call you back for questioning, although we do need more information on this very important subject.

We thank you for the presentation.

Mr. WINGFIELD. Thank you, sir.

Mr. D'EWART. Mr. Chairman, I understand that Mr. Wingfield is a resident of Washington. Would it be possible, if we desire, perhaps to have him return some day? This is a very interesting study that he has presented on power costs. While I do not want to hold him here, I think if at some future time he would be willing to come up, we would like to examine him on this presentation.

Mr. MURDOCK. Is that possible, Mr. Wingfield?

Mr. WINGFIELD. I would be perfectly willing, Mr. D'Ewart, but right now I am, as I stated in the first part of my statement, devoting all my time to the Arizona Power Authority. While my home is here in Washington I am staying out there at the moment 100 percent of the time. I would hate to come to Washington to make that statement.

Mr. D'EWART. I see. Well, we will try, if you do that, to make it convenient, and we will try not to do it unless it is necessary. It may well be that there will be other engineers.

Mr. WINGFIELD. If I could arrange to come, I would be glad to do so, but it would have to be with that understanding, sir.

Mr. D'EWART. This is a very interesting study. I think it is something that the committee should go into.

Mr. MURDOCK. Yes. We do need it for our consideration. Thank you again, Mr. Wingfield.

Mr. WINGFIELD. Thank you, sir.

Mr. MURDOCK. I wish now to turn the gavel over to Chairman Peterson, who has a very sad announcement to make at this time.

Mr. PETERSON. Gentlemen, it is my sad duty to announce the death of our distinguished chairman, who has been so helpful and kind, and who has served on this committee longer than any other man here. He died this morning. He had a rather difficult time recently, and we are indeed sad to hear the news.

We will clear the room, gentlemen, and we will have a short executive committee meeting.

Mr. MURDOCK. The Subcommittee on Irrigation and Reclamation will stand adjourned to meet at the call of the chairman.

(Thereupon, at 10:40 a. m., an adjournment was taken to meet at the call of the chairman.)

THE CENTRAL ARIZONA PROJECT

SATURDAY, APRIL 9, 1949

HOUSE OF REPRESENTATIVES,
SUBCOMMITTEE ON IRRIGATION AND RECLAMATION
OF THE COMMITTEE ON PUBLIC LANDS,
Washington, D. C.

The subcommittee met at 10 o'clock a. m., Hon. John R. Murdock (chairman) presiding.

Mr. MURDOCK. The committee will please be in order. As I have said before, I dislike to call a meeting of a committee or a subcommittee on Saturday morning. It is not our custom. But we have had some delays and we are about to take a recess over the Easter holidays and I thought we ought to try to round up matters somewhat today.

This committee will not have another session prior to next Thursday, when we take our recess, so that when we adjourn today, we will adjourn until after the Easter period.

There have been a good many witnesses here from Arizona for whom we did not find time. We have accepted their statements for the record and they have gone their way.

We have this morning Mr. Moritz from Boulder City, who also must get away.

It has been suggested by my colleagues that, in view of the fact that the funeral of our former chairman, Congressman Somers, is to be in New York City today at 10:30, it would not be appropriate for us to continue our committee hearings this morning after that time. I have that feeling myself. So that if we can dispose of the committee business in a somewhat satisfactory manner in the next 25 minutes, I think we ought to adjourn the committee at 10:30. Without objection, the committee will adjourn at 10:30 this morning.

The chair hears no objection and it is so ordered.

For the record, let me announce the program of the committee tentatively, as I see it. As the author of the bill I have asked the proponents to produce their witnesses and many have been produced and heard. There will be opposition witnesses, as well as opposition on the committee, and for that reason we are arranging, in fairness, that an equal amount of time at least be given those opposing witnesses. However, that will have to be arranged after the Easter period.

Some of the gentlemen who are witnesses here from California have expressed the desire to get away and want to be assured that there will be no committee meetings during the Easter period. There will be no meetings of this subcommittee during the recess, as previously stated, but there will be hearings of other subcommittees of the Public Lands Committee. I have just been talking with Congressman Morris of Oklahoma, chairman of the Subcommittee on Indian Affairs. There will be meetings of the Indian Affairs Subcommittee and pos-

sibly still others, but there will not be meetings of the Subcommittee on Irrigation and Reclamation, our subcommittee.

Some days ago, Congressman Engle expressed a desire to give answer to Mr. Knapp, one of the Arizona witnesses, and has come prepared to do so. Can you do it in 20 minutes, Mr. Engle?

Mr. ENGLE. Yes. The extent of my presentation was never intended to be long. It has not grown with the passage of time.

I have a statement which I have passed around to each of the members and I have also handed out a copy of Mr. Knapp's statement, so that the members can follow the comments which I make, in which I refer to Mr. Knapp's statement.

Mr. MURDOCK. If the gentleman will bear with me for a moment, I would like to ask permission to have inserted in the record certain statements from the Senate Hearings on S. 1175, first session of the Eightieth Congress; the testimony of Charles A. Carson, who is here in Washington, but is ill, and that of two other witnesses. Without objection, those will be inserted in the record.

(There was no objection.)

(The matter referred to is to be found in pp. 481 to 548, inclusive, of Hearings Before a Subcommittee of the Committee on Public Lands, United States Senate, 80th Cong. 1st sess., on S. 1175.)

(The statements are as follows:)

STATEMENT OF CHARLES A. CARSON, SPECIAL ATTORNEY FOR THE STATE OF ARIZONA ON COLORADO RIVER MATTERS

Senator MILLIKIN. Mr. Carson, will you state your full name, your residence, and your business.

Mr. CARSON. My name is Charles A. Carson. I live in Phoenix, Ariz. I am a practicing attorney and am special attorney for the State of Arizona on Colorado River matters.

The original statement that I made before the House committee last year, I understand, is incorporated in the record and will be printed as a part of the record.

Senator MILLIKIN. That is correct.

Mr. CARSON. So I want now to rebut some arguments here made by spokesmen for California interests.

The spokesmen for California interests argue three questions which I desire to briefly answer.

1. It is argued that the 1,000,000 acre-feet of water mentioned in article III (b) of the Colorado River compact is not apportioned to the lower basin.

I submit that the compact itself shows it is apportioned water; that the evidence in this record, including the testimony of Mr. Meeker, the statements of Mr. Carpenter, Mr. Hoover, Mr. Norviel, Mr. Lewis, and Governor Campbell, clearly disclose that the negotiators of the compact so regarded it and that the Members of Congress so regarded it when they approved the compact; and that the Supreme Court of the United States has held it to be apportioned water (*Arizona* v. *California*, 292 U. S., p. 341).

The particular ground of the decision to which I desire to call attention is the sixth ground of the decision reported on page 358.

Senator MILLIKIN. You will come to a further consideration of *Arizona* v. *California*?

Mr. CARSON. No. I can stop right now.

Senator MILLIKIN. I do not wish to interrupt. I just wanted to take a look at the record. But I do not need to do it right now. Go right ahead with the way you intend to state your case.

Mr. CARSON. I was trying to shorten it as much as possible.

2. It is argued that beneficial consumptive use is not measured by depletion of the Colorado River.

I submit that the negotiators of the compact were dealing solely with water flowing in a surface stream and that there is no way to measure beneficial con-

sumptive use of water flowing in a surface stream except by the resulting depletion.

I further submit that article III (d) of the compact shows that the negotiators of the compact used depletion as the measure of consumptive use.

I further submit that the Boulder Canyon Project Act, the California Limitation Act, and the Arizona contract measure consumptive uses by the resulting depletion of the Colorado River.

The Arizona contract is in this record.

3. It is argued that reservoir evaporation losses are chargeable solely to Arizona; that California bears no part of them.

I submit that when water is stored in on-stream reservoirs or off-stream reservoirs, it is in equity diverted from the stream, and I further submit that equity requires that all parties benefiting from storage of water should bear ratably evaporation losses caused by such storage.

I further submit that section 8 of the contract between the United States and and the metropolitan water district of southern California is as follows:

"SEC. 8. So far as the rights of the allottees named above are concerned, the Metropolitan Water District of Southern California and/or the City of Los Angeles shall have the exclusive right to withdraw and divert into its aqueduct any water in Boulder Canyon Reservoir accumulated to the individual credit of said district and/or said city (not exceeding at any one time 4,750,000 acre-feet in the aggregate) by reason of reduced diversions by said district and/or said city: *Provided*, That accumulations shall be subject to such conditions as to accumulation, retention, release, and withdrawal as the Secretary of the Interior may from time to time prescribe in his discretion, and his determination thereof shall be final: *Provided further*, That the United States of America reserves the right to make similar arrangements with users in other States without distinction in priority, and to determine the correlative relations between said district and/or said city and such users resulting therefrom."

I would like by reference to have incorporated in the record of this hearing the contract between the United States and the Metropolitan Water District of Southern California, pages 209 to 306, inclusive, of the Hoover Dam Contracts by Wilbur & Ely.

Senator MILLIKIN. It will be incorporated in an appendix to the transcript.

Mr. CARSON. It is, therefore, clear that both the Metropolitan Water District and the Secretary of the Interior anticipated ratable sharing of such evaporation losses.

I further submit that by regulation dated February 7, 1933, the Secretary of the Interior, Mr. Ray Lyman Wilbur, offered to Arizona the contract for water set out in exhibit A of such regulation. The Hoover Contracts, by Wilbur & Ely, pages 373 to 378, which I desire incorporated in this record.

Senator MILLIKIN. They will be incorporated in an appendix to the transcript.

Mr. CARSON. Mr. Wilbur was at that time Secretary of the Interior and Mr. Ely was an assistant to the Secretary. That offer clearly shows that the Department of the Interior recognized that Arizona was entitled to 2,800,000 acre-feet of main-stream water in addition to the use of all water of the Gila River and its tributaries with which recognition every argument here made by California spokesmen is in direct conflict.

In order to make this matter clear, I desire to set forth here a bare outline of the legal basis of Arizona's right to water of the Colorado River.

The Colorado River compact ratified by the States of Arizona, California, Colorado, Nevada, New Mexico, Utah, and Wyoming apportions 8,500,000 acre-feet of water per annum in perpetuity to the lower basin from the Colorado River system.

The lower basin comprises parts of California, Nevada, Utah, New Mexico, and practically all of Arizona.

California, as required by the Congress in the Boulder Canyon Project Act, by act of the California Legislature, has irrevocably and unconditionally limited herself to 4,400,000 acre-feet of the 8,500,000 acre-feet apportioned to the lower basin.

Nevada has a contract with the United States for 300,000 acre-feet.

The Bureau of Reclamation estimates that the ultimate possible uses in the portions of New Mexico and Utah which are in the lower basin will not exceed 131,000 acre-feet.

Arizona recognizes the rights of her sister States and does not attempt or intend to use any water to which any of them are entitled as herein outlined.

All of these figures deal only with apportioned water for the reason that any

surplus which is over and above the apportioned water is, under the compact, subject to further apportionment after 1963.

There is thus left approximately 3,700,000 acre-feet of apportioned Colorado River water which cannot lawfully be used anywhere except in Arizona.

Arizona uses approximately 1,100,000 acre-feet from the Gila River and its tributaries and is entitled to use approximately 2,600,000 acre-feet of apportioned water from the main stream of the Colorado River, which water can lawfully be used in Arizona and nowhere else.

Arizona has a contract with the United States for delivery of sufficient water from storage in Lake Mead to enable the consumptive use in Arizona of 2,800,000 acre-feet subject to its availability under the Colorado River compact and the Boulder Canyon Project Act.

Approximately 2,600,000 acre-feet is available under the compact and the act and cannot lawfully be used anywhere except in Arizona.

In amplification, I call the attention of the committee to my testimony given last year before the Irrigation and Reclamation Committee of the House of Representatives on H. R. 5434, which is already a part of the record of this hearing.

I desire particularly to call the attention of the committee to the quotations of the applicable compact provisions, statutory provisions, contract provisions, and the letter of Mr. Hoover and the picture of Mr. Hoover and the statements of Mr. Norvell, Governor Campbell, and Mr. Lewis which are there set out. And I think there can be no doubt of the intent of the negotiators of the compact nor the effect of the express language of the compact, which needs no interpretation, or of the provisions of the Boulder Canyon Project Act, which seem to me to be clear.

And when Congress required that California adopt its self-limitation statute, it did so in order to assure that there would be available for use in Arizona this 2,800,000 acre-feet of main-stream water plus all the water of the Gila River, as indicated by the succeeding paragraph in section 4 of the Boulder Canyon Project Act which, read with the California Limitation Act, established beyond peradventure of a doubt that that was the then intent of Congress.

Arizona has been in this situation. We desired more water than was permitted to us under the compact. Finally the compact was ratified. Congress passed the Boulder Canyon Project Act and we could get no relief and no water unless we ratified the compact and came into the proposition under the terms that Congress and the compact had provided. And when we did that we considered that the questions of the right of use of water in Arizona were settled.

Now, I submit to this committee that they are settled now provided only this, that California respect her own Limitation Act. These attempted changes in interpretation from the long-considered, accepted meaning of these terms, it seems to me, result only from the desire of California to escape its Limitation Act.

Now, there has been some mention here made of correspondence between Governor Warren of California and Governor Osborn of Arizona. I want to submit for this record copies of the letters of Governor Warren and the answers thereto of Governor Osborn, which express clearly, I believe, the official stand taken by the State of Arizona.

The first letter is from Governor Warren addressed to Governor Osborn and Governor Pittman, dated March 3, 1947. In that letter I desire to call to the attention of the committee that no statement is made of what claims California asserts or the basis of such claims, nor what controversies exist nor anything of the kind.

And then, answering that letter, under date of March 12, the letter of Gov. Sidney P. Osborn to Gov. Earl Warren in which Governor Osborn set forth clearly and succinctly the basis of the Arizona claim and of what we claim, and invited Governor Warren or any other governors of the basin to come over and talk it over. No further action was taken by Governor Warren to follow it up until, under date of May 16, 1947, he addressed another letter to Governor Osborn stating that it seemed to him a suit was necessary, but again setting forth no basis for any claim of California to water nor the amount of such claim.

And Governor Osborn's reply to that letter, dated May 23, 1947.

Senator MILLIKIN. What was the gist of the Governor's reply?

Mr. CARSON. The gist of the Governor's reply is that in his letter of March 12 he had set forth the basis of the Arizona claim and the foundation upon which it rests, and it contains these two paragraphs, that, I think, I should read:

"I am sure if you will review my letters and the compact, statutes, contracts, and reports therein mentioned, you will recognize that the only thing required for cooperation between our great States in developing the use of the water of the Colorado River to which they are respectively entitled for their mutual benefit and for the benefit of the Southwest and the Nation, is for your great State to respect the agreements your State has already made.

"I request that you again review my letters and if in your opinion there is any error in the facts, reasoning, or conclusions stated in my letters, I will appreciate your advising me concerning the same."

Senator DOWNEY. Mr. Chairman.

Mr. CARSON. Just a moment, Senator.

Mr. Chairman, may these be incorporated in the record in the order of dates?

Senator MILLIKIN. At this point in the order of dates, at this point in the transcript.

Senator Downey.

Senator DOWNEY. I was going to suggest that, to complete the record at that point, the letter of Governor Pittman replying to Governor Warren be also inserted.

Senator MILLIKIN. Isn't that among them?

Mr. CARSON. No. It isn't there because Governor Osborn didn't receive a copy of that letter from Governor Pittman at the time it was mailed to Governor Warren. I think later Governor Warren sent him a copy, but I do not have it there.

Senator MILLIKIN. Do you wish to have it included as a part of your showing?

Mr. CARSON. No.

Senator MILLIKIN. Well, then, include it please at the direction of the Chair.

Senator DOWNEY. At this point in the record?

Senator MILLIKIN. At this point please.

(The letter to Governor Warren from Governor Pittman follows:)

STATE OF CALIFORNIA,
GOVERNOR'S OFFICE,
Sacramento, March 3, 1947.

Hon. SIDNEY R. OSBORN,
Governor of Arizona, Phoenix, Ariz.
Hon. VAIL N. PITTMAN,
Governor of Nevada, Carson City, Nev.

MY DEAR GOVERNORS: We have just completed our review of the comprehensive plan for the Colorado River system as presented by the Bureau of Reclamation, and I am more than ever impressed by the staggering size and complexity of the proposal.

It is quite apparent, and it is admitted in the comprehensive plan, that the 134 projects inventoried will, if constructed, use more water than is available in the river system. This fact will undoubtedly emphasize the differences of opinion concerning the water to be made available to each State. It is therefore of the utmost importance to the lower-basin States that we reconcile our differences as soon as possible.

The negotiations of the past have failed to bring about agreement between Arizona and California but I am of the opinion that there must be some fair basis upon which their respective rights can be determined. The only methods that occur to me are (1) negotiation of a compact, (2) arbitration, and (3) judicial determination.

I would therefore like to suggest that we three Governors of the affected States endeavor first to enter into a compact which will resolve our differences and finally determine our respective rights.

In the event you believe for any reason that this cannot be done, I suggest that we submit all our differences to arbitration, agreeing to be bound by the results thereof.

If this is not feasible, I propose that we join in requesting Congress to authorize a suit to determine our rights in the Supreme Court of the United States, which suit could, if agreeable to the States, be submitted on an agreed statement of facts.

I believe that either method could produce the desired results. If you agree with me, I suggest that the three of us meet at some time and place mutually agreeable for the purpose of further exploring the subject. If we can place our three States in position to maintain a common front in urging the speedy and

orderly development of the Colorado River system, we will have rendered a great service to our people.

Hoping that I may have your reaction to this proposal and with best wishes, I am,

Sincerely,

EARL WARREN, *Governor.*

EXECUTIVE OFFICE, STATEHOUSE,
Phoenix, Ariz., March 12, 1947.

Hon. EARL WARREN,
Governor, State of California,
Sacramento, Calif.

MY DEAR GOVERNOR WARREN: I have your letter of March 3, addressed to Governor Vail Pittman and myself, concerning the Report of the Bureau of Reclamation on the Development of the Water Resources of the Colorado River Basin.

I presume from your letter that you have completed and sent to the Bureau your comments on the above-mentioned report. I, too, have furnished the Bureau with my comments and am enclosing a copy to you herewith. It will be appreciated if you will furnish me with a copy of your report.

Ever since I have been Governor of Arizona I have endeavored to cooperate with all other States in the Colorado River Basin in all matters of common interest. Arizona has at all times been represented on the Committee of Fourteen and Sixteen, whose name has now been changed to the Colorado River Basin States Committee. Arizona is now represented on the Colorado River Basin States Committee, which committee as presently constituted and as heretofore constituted, has been very helpful in all matters affecting the interests of the respective States in the Colorado River. Arizona is now cooperating in plans for the utilization of Colorado River water in the respective States within the allocation of water available to them.

I will be pleased to meet with you, or with you and Governor Pittman, or with the governors of other interested States, to discuss all matters of common interest to our respective States.

All seven of the Colorado River Basin States—Arizona, California, Colorado, Nevada, New Mexico, Utah, and Wyoming—five of which States are still represented on the Colorado River Basin States Committee, are parties to the Colorado River compact which apportions the water of the Colorado River system as between the upper basin and the lower basin and to Mexico. The compact contains provisions which make utilization of water over and above the apportionment made by the compact of interest to all of the States of the basin.

Portions of Utah and New Mexico are in the lower basin and are entitled to share in the apportionment made to the lower basin and in the use of any available water which is unapportioned by the Colorado River compact.

California, in consideration of the passage by the Congress of the Boulder Canyon Project Act and as a condition precedent to the taking effect of that act and the construction of Boulder Dam, Imperial Dam, and the All-American Canal, by chapter 16, California Statutes 1929, entered into a statutory agreement with the United States and for the benefit of each of the Colorado River Basin States, irrevocably and unconditionally limiting California's claim to water of the Colorado River to 4,400,000 acre-feet per annum of the apportioned water, plus not more than half of the water unapportioned by the Colorado River compact. The quantity of surplus water, that is, water unapportioned by the compact, varies from year to year and is subject to further apportionment by agreement between all of the compact States after 1963.

Arizona recognizes the right of California to use the quantity of water to which California, by the statutory agreement, is forever limited.

Arizona recognizes the right of Nevada to use 300,000 acre-feet of apportioned water per annum, plus one twenty-fifth of available unapportioned water, subject to further apportionment of the unapportioned water by agreement between the compact States after 1963.

Arizona has a contract with the United States for delivery for use in Arizona from the main stream of the Colorado River, subject to its availability for use in Arizona, under the Colorado River compact and the Boulder Canyon Project Act, of so much water as is necessary to permit the beneficial consumptive use in Arizona of main-stream water to a maximum of 2,800,000 acre-feet of the apportioned water, plus one-half of the available surplus, less such part of the one twenty-fifth thereof as Nevada may use, the quantity of which surplus, of course, varies from year to year, and which surplus is subject to further apportionment by agreement between all of the compact States after 1963.

Arizona does not claim the right to the use of any water to which California is entitled, nor the right to the use of any water to which Nevada is entitled, and I am sure that Nevada does not claim the right to the use of any water to which California is entitled, nor the right to the use of any water to which Arizona is entitled. It therefore appears that California and Nevada are now in a position to join Arizona in urging the speedy consideration and passage of S. 433 now pending in the United States Senate and H. R. 1598, its companion bill, now pending in the House of Representatives, which are authorization bills to authorize the construction of the central Arizona project, and H. R. 1597, which is an authorization bill to relocate the boundaries of the Gila project heretofore authorized.

I am certain that the passage of these bills and the construction of the works which they seek to authorize will be of great and incalculable benefit, not only to Arizona, but to California and Nevada and to the United States as a whole. They are vitally necessary to the welfare and to the economy of the whole southwest region. They do not in any way interfere with the full use in California and in Nevada of the water to which California and Nevada are respectively entitled.

If either California or Nevada are interested in the promotion and construction of projects for the utilization of water to which they are respectively entitled, I would like to know it in order that I may render such aid as seems appropriate.

It is difficult for me to understand what, if anything further, need be done to place either California or Nevada or Arizona in position to support the utilization in our respective States of our respective shares of the water of the Colorado River, which shares have already been determined by the Colorado River compact, the Boulder Canyon Project Act, the California Limitation Act, the water-delivery contracts of the California agencies, the Nevada water-delivery contracts, and the Arizona water-delivery contract.

However, I will be glad to meet and discuss with you and the governors of the other Colorado River Basin States, jointly or severally, any matters of common interest, and if at such conference or conferences it should develop that there are any substantial differences, we can consider and perhaps resolve such differences and if it should develop that anything further is necessary we can consider the proper course to pursue.

During your incumbency we in Arizona have not had the pleasure of a visit from you. We would like to see you over in our State and I will greatly appreciate it if you can arrange to come to Phoenix as soon as possible, either alone or with Governor Pittman, or with such other governors of the Basin States as you may desire to have present, in order that any matters which you may desire to further discuss can be gone into fully and thoroughly.

With all good wishes, I am

Sincerely,

SIDNEY P. OSBORN, *Governor.*

EXECUTIVE OFFICE, STATE HOUSE,
Phoenix, Ariz., May 23, 1947.

Hon. EARL WARREN,
Governor of California, Sacramento, Calif.

MY DEAR GOVERNOR WARREN: I have received your letter of May 16 and appreciate your personal good wishes.

In my letter to you of March 12 and in my letter to William E. Warne, Acting Commissioner of the Bureau of Reclamation, of November 22, 1946, a copy of which I sent to you, I clearly stated the facts and the reasoning which in my opinion lead to the inescapable conclusion that the quantities of apportioned water available for use in Arizona, California, and Nevada, respectively, from the Colorado River, are already determined.

If you do not agree with such facts and reasoning and my conclusions, it is regretable that you do not specify wherein you disagree.

On page 8 of the Views and Recommendations of the State of California on Proposed Report of the Secretary of the Interior entitled "The Colorado River" there purports to be a list of relevant statutes, decisions, and instruments affecting the Colorado River, but no mention is there made of the California Self-Limitation Act, chapter 16, California Statutes, 1929.

I discussed the California Self-Limitation Act as well as the other relevant compact, statutes, contracts, and reports in my letters, but in your letters to

me you make no exception to any statements in my letters, nor do you set forth any statement of any facts, reasoning, or conclusions as to what claim to water of the Colorado River you intend to assert for California nor the basis for such claim.

California has unconditionally and irrevocably limited herself forever to the quantity of water set out in the California Self-Limitation Act. Arizona has by contract recognized the right of California to the quantity of water set out in that act and Arizona does not intend to and will not attempt to utilize water to which California is entitled.

Arizona respects her commitments.

Any aspiration entertained in California to use water in excess of that limitation appears to be illegitimate. If California would be content with the use of the quantity of the water to which she has by solemn statutory agreement unconditionally and irrevocably limited herself forever all occasion for any feeling that any further compact, any arbitration or litigation is advisable would disappear.

I am sure if you will review my letters and the compact, statutes, contracts, and reports therein mentioned you will recognize that the only thing required for cooperation between our great States in developing the use of the waters of the Colorado to which they are respectively entitled for their mutual benefit and for the benefit of the Southwest and the Nation, is for your great State to respect the agreements your State has already made.

I request that you again review my letters and if in your opinion, there is any error in the facts, reasoning, or conclusions stated in my letters, I will appreciate your advising me concerning the same.

With all good wishes, I am

Sincerely,

SIDNEY P. OSBORN, *Governor.*

STATE OF CALIFORNIA,
GOVERNOR'S OFFICE,
Sacramento, May 16, 1947.

The Honorable SIDNEY P. OSBORN,
Governor of Arizona, Phoenix, Ariz.

DEAR GOVERNOR OSBORN: I did not bother you during the time you were ill in our State concerning my suggestions for settling the differences of opinion of Arizona and California regarding their respective rights to the use of the water of the Colorado River. However, now that you have recovered sufficiently to return to your home, I would like to discuss your letter of March 12, 1947, and the accompanying copy of your letter to William E. Warne, Acting Commissioner of the Bureau of Reclamation, dated November 22, 1946.

I gather from these two letters that you believe it is unnecessary to try to write a compact between the lower basin States or to have our respective claims arbitrated, because you consider the existing statutes, contracts, etc. have so settled the rights of Arizona, California, and Nevada in the Colorado River that there are no substantial differences between the States. It may well be that the suggestions of a compact and arbitration are not feasible at this late date, but I am of the opinion that there are such basic divergencies of interpretation of the statutes and documents mentioned above, particularly between Arizona and California, that without an authoritative determination as to which State is right, it is impossible for anyone to know what quantity of water either State is entitled to. If our States are to plan for their futures, they must know with certainty how much water is eventually to be made available to them, because everyone recognizes that there is not enough water in the river to fully serve the legitimate aspirations of both our States.

It seems to me that a suit in the Supreme Court of the United States, to which the lower basin States and the United States are parties, is essential to supply the necessary answer. This would of course require a jurisdictional act of Congress, authorizing the United States to be made a party to such suit. Governor Pittman of Nevada has expressed a similar opinion in a letter to me dated March 6, a copy of which is enclosed. I am sure that such a procedure will eventually redound to the benefit of both of our States.

With best wishes for the continued improvement of your health, I am

Sincerely,

EARL WARREN, *Governor.*

Senator MILLIKIN. Proceed, Mr. Carson.

Mr. CARSON. Mr. Chairman, in my testimony that I gave last year before the House committee, I reviewed rather thoroughly the history of this controversy,

the attempts that had been made to negotiate, the attempts that had been made to arbitrate, and the attempts that had been made by Arizona in the Supreme Court of the United States to secure an equitable apportionment of this water.

Now, California opposed that suit, moved that it be discussed. They have known clearly since 1944 of our purpose and plan and they have not again threatened a suit until after Senator McFarland and Senator Hayden began to press for the date for this hearing. So in that suit, as in any contemplated suit, there is a grave question as to whether or not the Supreme Court will take jurisdiction to adjudicate an equitable apportionment of water unless and until one State can allege that it is in danger of injury by a planned and going action of another State.

If California's spokesmen can by the threat of a suit so block Arizona and the congressional acts and the United States in the utilization of water, there will be no necessity for their suit. If this Congress goes ahead and authorizes this suit, before any money could be spent, California would have an opportunity to go into court and test the question on a firmer and sounder basis than they would have in the absence of any authorizations. What we are doing now is trying to get the authorization, and until somebody has some method of going ahead and diverting water, it is very doubtful if the Supreme Court would take jurisdiction, even in the face of the declaratory judgment statute. They have consistently refused to do so.

Senator MILLIKIN. Your theory is that the Supreme Court would require a showing of injury before taking jurisdiction?

Mr. CARSON. Take jurisdiction——

Senator MILLIKIN. A showing of injury or I assume——

Mr. CARSON. Potential injury.

Senator MILLIKIN. Threat of injury.

Mr. CARSON. Threat of injury to a going project.

So that I think now that in mentioning the possibility of a suit these California spokesmen have merely in mind the effect on this Congress, because they refused to join when we tried to sue. I think it is for the purpose of confusion and delay that that statement is here injected.

Senator MILIKIN. I am speaking now about the interpretation or construction of the compact. Is there any contention on behalf of Arizona that the compact in any way has been amended?

Mr. CARSON. No, sir.

Senator MILLIKIN. Does California contend that the compact has in any way been amended?

Senator DOWNEY. Will you repeat the question?

I prefer to have Mr. Shaw answer.

Senator MILLIKIN. I am passing questions of interpreting the compact or construing the compact, assuming but not conceding that there is ambiguity in it. Is there any contention that the compact by any subsequent procedures of any kind, subsequent instruments, subsequent doings or acts or in any other manner has been amended?

Mr. SHAW. It has been amended in one particular, in effect. By the terms of article IV of the compact, navigation was subordinated to other uses, that is, domestic, irrigation, and power. By the terms of section 6 of the project act, navigation was made superior to the other uses. But article IV of the compact itself permitted Congress to do that very thing, so that there has been no great violence, you might say, done to the terms of the compact since it was framed.

Senator MILLIKIN. That was a practical solution in order to make it possible to have a law, was it not?

Mr. SHAW. Yes, sir.

Senator MILLIKIN. Thank you.

Mr. Carson, what is the citation of this Arizona-California case?

Mr. CARSON. 292, page 358; the sixth ground, stated on page 358. The paragraph begins "Sixth."

Senator MILLIKIN. When did Arizona approve the compact?

Mr. CARSON. In February 1944.

Senator MCFARLAND. I was about to ask one question, Mr. Chairman.

Senator MILLIKIN. Proceed.

Senator MCFARLAND. Mr. Carson, the Boulder Canyon Project Act outlined the conditions under which it would become effective. The compact had to be ratified by seven States and failing to do so within 6 months by six States including California and provided California agree to certain conditions including the following:

"And, further, that until the State of California by act of its legislature shall agree irrevocably and unconditionally with the United States and for the benefit of the States of Arizona, Colorado, Nevada, New Mexico, Utah, Wyoming as an express covenant to the consideration of the passage of this act, and that the aggregate annual consumptive use, diversions less return flow to the river of the water of and from the Colorado River—"

that that is all-inclusive, that wording?

Mr. CARSON. Yes.

Senator MCFARLAND. And that that is the only water they can take?

Mr. CARSON. That's right.

Senator MCFARLAND. Because it says "of and from the Colorado River."

Mr. CARSON. Yes.

Senator MCFARLAND. And for use in the State of California. There couldn't be used any of the Gila River water in the State of California, could there?

Mr. CARSON. No.

Senator MCFARLAND. (reading):

"Including all uses under contracts made under the provisions of this act and all water necessary for the supply of any rights which may now exist, shall not exceed 4,400,000 acre-feet of the waters apportioned to the lower basin States by paragraph (a) of article III of the Colorado River compact."

Now, the only exception to that condition, as I understand your interpretation, is this "plus":

"Not more than one-half of any excess or surplus water unapportioned by such compact, such uses always to be subject to the terms of said compact."

Now I will ask you if in the next paragraph the Congress itself doesn't interpret that provision by setting out what it will ratify if Arizona wants to come in and accept it by way of an agreement "that the States of Arizona, California, and Nevada are authorized to enter into an agreement which shall provide: (1) That of the 7,500,000 acre-feet annually apportionment to the lower basin by paragraph (a) of article III of the Colorado River compact, there shall be apportioned to the State of Nevada 300,000 acre-feet and to the State of Arizona 2,800,000 acre-feet for the exclusive, beneficial consumptive use in perpetuity. And that the State of Arizona may annually use one-half of the excess or surplus water unapportioned by the Colorado River compact, and that the State of Arizona shall have the exclusive beneficial consumptive use of the Gila River and its tributaries within the boundaries of the State, and that the waters of the Gila River and its tributaries, except return flow after the same enters the Colorado River, shall never be subject to any diminution whatever by any allowance of water which may be made by treaty or otherwise to the United States or Mexico, but if, as provided in paragraph (c)" and so forth.

In other words, as I understand your interpretation, the Congress of the United States, by setting out this, placed an interpretation on the California Limitation Act, provided for, as permitting that amount of use of water in Arizona.

Mr. CARSON. That's right. And that is emphasized, also, by the contract offered Arizona, to which I referred, by the Department of the Interior. It is already in the record, but I just want to red this much of it.

Senator MILLIKIN. You say "offered Arizona." Was the contract concluded? Was the contract made?

Mr. CARSON. No; this contract wasn't made. It was offered to Arizona by the Secretary of the Interior at that time.

It is article X:

"From storage available in reservoir created by Hoover Dam, the United States will deliver under this contract each year at points of diversion hereinafter referred to on the Colorado River so much available water as may be necessary to enable the beneficial consumptive use in Arizona of not to exceed 2,800,000 acre-feet annually by all diversions effective from the Colorado River and its tributaries below Lee Ferry but in addition to all uses from waters of the Gila River and its tributaries."

Senator MCFARLAND. That is all the questions I have.

Mr. CARSON. Mr. Chairman, there is one more thing that I would like to volunteer.

Senator DOWNEY. Mr. Carson, before you leave that last subject, that contract that you just read and the part you have just read is followed by a stipulation that the contract does not in any way mean to interpret what shall be class A water and class B water?

Mr. CARSON. It has some clause in it that it is without prejudice of the claim

of any State as to interpretations and so forth, I am sure, but I haven't it before me now.

Senator McFARLAND. Is that in all the contracts?

Mr. CARSON. Yes; I think that is in all of the contracts. But, now, in this contract of the Metropolitan water district, which is incorporated and will be placed in the record, it contains within it, as do all of the other California contracts, a statement as to the priority of their claim and that they are subject to the availability of water under the compact and the act to the same degree as we are. There is no difference there, this priority.

Senator MILLIKIN. May I interrupt you just a moment?

Has anyone ever put under single cover all of the contracts and all of the instruments and documents that bear on the legal questions involved in this case?

Mr. CARSON. Most of the underlying contracts, compact, and the act, and some of the opinions that were given up until the time this was published in 1933 are accumulated in this Hoover Dam contract by Wilbur and Ely. There is no other that is complete.

Senator MILLIKIN. Would you remind me, Miss McSherry, to ask Legislative Reference to assemble within two covers all of the contracts and documents including, of course, the compact, the California self-limitation statute, and any other laws that have legal bearing on the legal problems involved here and to submit their work before conclusion to the two Senators so that if anything is omitted it will be included, so that we may have one single source for ready reference to everything that is involved here as far as the legal questions are concerned.

Senator DOWNEY. Mr. Chairman, would it be appropriate to put in that compilation the different statements and interpretations that have been given by the Bureau of Reclamation and these responsible officials that we both here rely on?

Senator MILLIKIN. Let me rule on that in this way, that after Legislative Refence submits its tentative work to the two Senators that anything that either Senator thinks has relevant bearing may be included, and I ask for, and I know it will be forthcoming, a decent sense of restraint against unduly "padding" the record. But I would like to have under one cover everything that all of us consider relevant to the legal questions involved.

Mr. CARSON. May I just make a voluntary statement concerning this metropolitan contract? It contains all of the system of priorities that are set up in California internally that do not affect any other States.

The question here presented, in my judgment, is for California to respect its Limitation Act of 4,400,000 acre-feet per annum of apportioned water, and it it does, it is within California's power to readjust its internal priority agreement without injury to anyone and bring its present uses clearly within its 4,400,000 acre-feet. But they don't propose to do that. They propose to fight Arizona in order to irrigate 400,000 to 500,000 acres of new land on the east mesa and the west mesa of the Imperial Valley for which no distribution works have been built. True, it can be served through the All-American Canal, but no distribution systems have been built and it is nearly all publicly owned land and they could do it now without injury. But they propose to fight Arizona, and if I read them correctly, all of the other States of the basin, in order to assure that they themselves do not have to go in and readjust their own internal priority system.

Now, I am not familiar with California law, but Senator Downey states that they cannot condemn there without condemning everything in the Los Angeles Basin. I am sure if that is the case, the California Legislature can very easily correct it.

That is about all I can add at this time.

Senator MILLIKIN. I think I asked yesterday that there be put in by reference the priority scale California applies internally to these waters. I assume that will be put in.

Senator DOWNEY. Yes.

Mr. CARSON. It is all set out in this metropolitan contract and in each one of their other contracts.

Senator DOWNEY. Mr. Chairman, I have only one question.

I would like to read to Mr. Carson a paragraph of the Arizona-California case in the Supreme Court in 1933, and I would appreciate it if Mr. Carson could give me a "Yes" or "No" answer to my question. I think it simply admits of that, with any explanation that he wants thereafter.

In the opinion of the Court, October term, 1933, United States Reports, volume 292, appears this paragraph:

"The considerations to which Arizona calls attention do not show that there is an ambiguity in article III (b) of the compact. Doubtless, the anticipated physical sources of the waters which combine to make the total of 8,500,000 acre-feet are as Arizona contends, but neither article II (a) nor (b) deal with the waters on the basis of their source. Paragraph (a) apportions waters "from the Colorado River system," i. e., the Colorado and its tributaries and (b) permits an additional use "of such waters." The compact makes an apportionment only between the upper and lower basin; the apportionment among the States in each basin is left to later agreement. Arizona is one of the States of the lower basin and any waters useful to her are by that fact useful to the lower basin. But the fact that they are solely useful to Arizona, or the fact that they have been appropriated by her, does not contradict the intent clearly expressed in paragraph (b) (nor the rational character thereof) to apportion the 1,000,000 acre-feet to the States of the lower basin and not specifically to Arizona alone. It may be that, in apportioning among the States the 8,500,000 acre-feet allotted to the lower basin, Arizona's share of waters from the main stream will be affected by the fact that certain of the waters assigned to the lower basin can be used only by her; but that is a matter entirely outside the scope of the compact."

That is the end of the paragraph. Mr. Carson, do you either agree or disagree with the accuracy of the statement made in the Supreme Court decision?

Mr. CARSON. I agree with it.

Senator DOWNEY. That is all, Mr. Chairman.

Mr. CARSON. I want to explain that, Mr. Chairman, then. I brought that suit for Arizona to perpetuate testimony of what had occurred at the original compact negotiations in order to establish what was testified to here by Mr. Meeker in a form that we could later use in any litigation that might later arise. That it was clearly understood is shown by the letters of Mr. Hoover and the statements made by Governor Campbell, Mr. Norveil, and Mr. Lewis, and it was clearly understood at that time that immediately following the adjournment of that conference in Santa Fe, N. Mex., in 1922 there would be a tri-State agreement made between California, Arizona, and Nevada specifying that the million acre-feet of III (b) water was for Arizona.

But during the course of the years, when the California Limitation Act was passed, it became no longer necessary for us to support that position, because there is apportioned 8½ million to the lower basin, 8½ million acre-feet, of which California is limited to 4,400,000, which leaves for Arizona 3,800,000 less minor adjustments for Utah and New Mexico, of which amount we get a million acre-feet from the Gila and the balance from the main stream, so you come out the same.

Senator MILLIKIN. What was the date of the California Limitation Act?

Mr. CARSON. 1929.

Senator MCFARLAND. Do you agree, then, Mr. Carson, with Mr. Matthew when he stated here under cross-examination that if this III (b) water is apportioned water, California couldn't use it; under the California Limitation Act?

Mr. CARSON. That they could not use it, as under the California Limitation Act it is apportioned water.

Senator MCFARLAND. That was admitted by California in their testimony here.

Senator MILLIKIN. What treatment did the Supreme Court give to the California Limitation Act?

Mr. CARSON. It wasn't raised in this case. This was merely a unique bill to perpetuate testimony, and they did not permit us to perpetuate it on the ground, among others, of this sixth ground stated in their opinion. And there was no ambiguity, that it was apportioned to the lower basin but not to Arizona alone and, therefore, there was no necessity of perpetuating the testimony.

Senator MILLIKIN. The California limitation statute was not before the Court at all?

Mr. CARSON. No. There was just a question of perpetuating testimony.

Senator DOWNEY. Mr. Chairman, I would also like to read into this record a different volume than I read from before. It is a different edition but from the same case.

This is 298 U. S. 563 to 568, Eightieth Law Edition.

Mr. CARSON. That is a different case.

Senator DOWNEY. Which case is it? Is this another case between the two States?

Mr. CARSON. Yes. This is 292 U. S.

Senator DOWNEY. Well, I am away behind.

Very well. Mr. Carson is evidently away ahead of me.

Under 564 appears this statement, and I am reading now from the Complaint of Arizona and this allegation of the Complaint of Arizona, I am informed, was adopted as a finding by the Supreme Court.

Senator MILLIKIN. Now, what case is this? And what is the citation?

Senator DOWNEY. This is *Arizona* v. *California* (298 U. S. 563 to 565): "* * * by the six defendant States, and the limitation upon the use of the water by California was duly enacted into law by the California Legislature by act of March 4, 1929, supra. By its provisions the use of the water by California is restricted to 5,484,500 acre-feet annually."

That is the opinion of the Court, deduced from the allegations of Arizona's complaint, which the Court's opinion adopted as its findings. That is the effect of the allegation made in Arizona's pleading.

Mr. Chairman, I have a luncheon engagement, so I think I will withdraw.

Senator MILLIKIN. We will close in just 1 minute.

Do you wish to make any comment on that, Mr. Carson?

Mr. CARSON. I haven't read the full opinion recently, but that was a case brought by Arizona to try to obtain a decision of the Supreme Court equitably to apportion the water of the river, the same kind of a case that they are talking about bringing now; but my recollection is that Arizona's allegations were not as stated by Senator Downey.

I had, previous to the bringing of that case, given an opinion to our people that we could not maintain it, and I did not participate in that suit.

But the Supreme Court refused to take jurisdiction, and made no decision on the merits.

STATEMENT OF CLIFFORD H. STONE, DIRECTOR, COLORADO WATER CONSERVATION BOARD, AND COMMISSIONER FOR COLORADO ON THE UPPER COLORADO RIVER BASIN COMPACT COMMISSION

Senator MILLIKIN. Judge Stone, will you take a seat and give the reporter your name, your address, and your business.

Mr. STONE. My name is Clifford H. Stone. For a period of 10 years I have been identified in various capacities with matters which concern the Colorado River.

I am a lawyer and have practiced in Colorado for 28 years. At the present time I am director of the Colorado Water Conservation Board and commissioner for Colorado on the Upper Colorado River Basin Compact Commission. My work has entailed a study and consideration of the Colorado River compact, Boulder Canyon Project Act, California's Self-Limitation Statute, and various contracts and documents relating to the Colorado River.

The compact, legislative acts, contracts, and related documents have been described as the law of the river.

Any proposed legislation which involves an interpretation of the Colorado River compact is of concern to each of the seven signatory States to that compact. Such interpretation is injected in the hearings on S. 1175 now before this committee.

In my appearance here, I shall confine my statement to two principal issues dealing with interpretation of the Colorado River compact. They are:

1. Is the water covered by paragraph (*b*) of article III of the Colorado River compact excess or surplus waters unapportioned by the compact, and has California, by the terms of the Limitation Act, renounced any claim to the 1,000,000 acre-feet by which the lower basin may increase its beneficial consumptive use?

2. Is the measure of beneficial consumptive use of waters of the Gila River in Arizona the amount of depletion of the virgin flow of the river at its confluence with the Colorado River?

It is my position that the million acre-feet of water, covered by paragraph (*b*) of article III of the Colorado River compact, is apportioned water to the lower basin. It is not excess or surplus water unapportioned by the compact.

Paragraph (*b*), article III, reads:

"In addition to the apportionment in paragraph (*a*), the lower basin is hereby given the right to increase its beneficial consumptive use of such waters by 1,000,000 acre-feet per annum."

This paragraph follows paragraph (*a*), which provides:

"There is hereby apportioned from the Colorado River system in perpetuity to

the upper basin and to the lower basin, respectively, the exclusive beneficial consumptive use of 7,500,000 acre-feet of water per annum, which shall include all water necessary for the supply of any rights which may now exist."

Article III contains a paragraph (*f*) which, since the compact was approved by the Congress in 1928, has been commonly understood as the only provision of the compact defining excess or surplus waters of the Colorado River system, unapportioned by other provisions of article III.

This paragraph is important, and I shall discuss it extensively. It reads:

"Further equitable apportionment of the beneficial uses of the waters of the Colorado River System" and I wish the committee would note these reports, "unapportioned by paragraphs (*a*), (*b*), and (*c*) may be made in the manner provided in paragraph (*g*) at any time after October 1, 1963, if and when either basin shall have reached its total beneficial consumptive use as set out in paragraphs (*a*) and (*b*)."

California makes the contention before this committee that III (*b*) water is a part of "excess or surplus waters unapportioned by the Colorado River compact."

In considering this question, the essential nature of an interstate compact must not be overlooked. A compact is an agreement or treaty of sovereign States. Under the Federal Constitution such a treaty or agreement may be made only with the consent of the Congress. After negotiation by representatives or commissioners of the compacting States, it may be effectuated only by ratification of the legislatures of such States. The terms and conditions of a compact must be construed and interpreted so as to reflect the understanding of the legislatures in the ratification of the compact.

The Colorado River compact, after ratification by six of the basin States, was approved by Congress by the Boulder Canyon Project Act, passed in 1928.

Senator MILLIKIN. Is it your contention that there is ambiguity is the compact requiring construction?

Mr. STONE. I am going to point that out to you. I take that up later, Senator.

The Supreme Court of the United States, in *Arizona* v. *California*, 292 U. S. 341, at page 359, held:

"The Boulder Canyon Project Act rests, not upon what was thought or said in 1922 by negotiators of the compact, but upon its ratification by the six States."

This same case holds that when the meaning of a compact is not clear recourse may be had to written statements and documents communicated to the respective governments of the negotiators or to their ratifying bodies. This rule, no doubt, would also apply to written reports or communications transmitted to the Congress by a Federal representative who participated in the negotiation of a compact.

This rule is rational when it is kept in mind that it is the intent, purpose, and understanding of the ratifying bodies of participating State governments, which is of permanent concern. It is the will of the ratifying governments which gives effect to an interstate agreement. Compacts would be of little value, indeed, if their intent and purpose could be thwarted, changed, and modified by strained interpretations, founded on oral statements of negotiators and debates in Congress.

In any event, no report should be made to written documents and legislative history of either the ratifying acts of the signatory States or of the Congress, if the language of a compact is clear, unambiguous, and unequivocal.

It is my position that the language of the Colorado River compact, respecting apportioned water and that which is unapportioned, is so clear and unambiguous that there is no necessity of going beyond the language of the instrument itself to understand its terms, conditions, and provisions, which were ratified by the legislatures of the signatory States.

That answers your question, Senator.

It is against all rules of legislative and judicial procedure to equivocate concerning an agreement among sovereign States, when the language of an agreement made by them is reasonably clear. In this case, we contend that the compact language is so unquestionably clear and unambiguous that any effort to change its patent meaning by interpretations, allegedly supported by collateral documents and statements is equivalent to an attempt to thwart the will of the States. Extreme caution should be exercised to prevent a State, signatory to an interstate compact, from circumscribing by this method its solemn agreement with sister States.

Let us look at the language of the compact on the subject under discussion.

First, we observe that the compact deals with all of the water of the Colorado River and its tributaries within the United States of America. This is

shown by article II (*a*) of the compact defining the "Colorado River system." It is also shown by other language throughout the compact.

Second, article III clearly shows that all of the water of the Colorado River system except that provided for Mexico and the unapportioned surplus as specified in paragraph (*f*), is apportioned between the upper basin and the lower basin, and no apportionment of water is made to any particular State of either of the basins.

Paragraph III (a) "apportioned" from the Colorado River system in perpetuity to the upper basin and lower basin, respectively, the exclusive beneficial consumptive use of 7,500,000 acre-feet of water per annum. Article III (b) provided that "in addition to the apportionment in paragraph (a)," the lower basin is given "the rgiht to increase its beneficial consumptive use of such waters by 1,000,000 acre-feet per annum."

The words "such waters" in paragraph (b) refer back to the waters of the "Colorado River system" mentioned in paragraph (a).

The dictionary defines the word "apportion" as meaning "to divide and assign in just proportion; to portion out; to allocate." It is only common sense to conclude that when the compact used the word "apportioned" in paragraph (a), and the words "the lower basin is hereby given the right to increase its beneficial consumptive use," in paragraph (b), the probative effect in each instance was the same.

The compact itself recognized that these terms were used in a synonymous sense when it provides in paragraph (f), article III, that "further equitable apportionment of the beneficial uses of the waters of the Colorado River system "unapportioned" by paragraphs (a), (b), and (c) may be made in the manner provided in paragraph (g) at any time after October 1, 1963."

I think we cannot mistake that language.

Note that there, the negotiators of the compact, by their own language, which was subsequently approved by legislatures of the signatory States, used the word "unapportioned" to describe water which was not "apportioned" by either paragraphs (a) or (b) or (c). It is this paragraph (f) which covers "excess or surplus waters." By its own language, it excludes the water in paragraph (b) which, under the contention of California, is attempted to be added to it. If it is the position of California that there is some other type of "excess or surplus water" that is unapportioned, then may we point out that by the terms of paragraph (f) all water is covered except that specified in paragraphs (a), (b), and (c).

It is folly to speculate, or attempt to draw conclusions, as do the spokesmen for California, that there is any significance in the manner by which the compact covers apportioned water in two separate paragraphs. We suspect that there were reasons which are not disclosed by the language of the compact. This is unimportant, however, if the effect of either or both paragraphs is to actually divide, apportion, or allocate water to the two basins or either basin. Effect must be given to the plain wording of the compact.

Nor is there any support in the fact that paragraph (f) mentions paragraph (c), as well as paragraphs (a) and (b), as apportioned water. It is contended by those who support California's position that paragraph (c) does not apportion any water. The fact remains that paragraph (b) is described by paragraph (f) as apportioned water. Further, may we point out that paragraph (c) does affect the apportionment of water. It provides that in the event the United States of America should recognize in Mexico any right to the use of any of the waters of the Colorado River system, such water shall be supplied first from the waters which are surplus over and above the aggregate of the quantities specified in paragraphs (a) and (b); and if such surplus shall prove insufficient for this purpose, then the burden of such deficiency shall be borne by the upper basin and the lower basin. The effect of paragraph (c) is to cut down the apportionment to each basin upon the happening of a certain contingency. Careful draftsmanship would surely dictate the inclusion of paragraph (c) in setting up in paragraph (f) what constitutes surplus water.

And, may we call attention to the language of paragraph (c) which, itself, clearly supports the conclusion that the water mentioned in paragraph (b) is not excess or surplus water unapportioned by the Colorado River compact. This paragraph states that any water for Mexico shall be provided "first from the waters which are surplus over and above the aggregate of the quantities specified in (a) and (b)." The definition and meaning of "surplus," over and above the aggregate of the quantities specified in paragraphs (a) and (b), is clearly shown by the compact. This paragraph (c) also provides that any

future right of Mexico should be supplied from water surplus over (a) and (b). It demonstrates beyond question that all unapportioned surplus water is covered by paragraph (f), which, according to the expressed provisions of the compact, is water "unapportioned by paragraphs (a), (b), and (c)."

We urge, therefore, that by clear and unambiguous language the Colorado River compact provided that III (b) water is not excess or surplus but is apportioned. As a corollary to this conclusion, we submit that the will and understanding of the legislature which ratified the compact cannot be thwarted and changed by an attempt to vary its terms through collateral documents, statements, or by debate in the Congress when the Boulder Canyon Project Act was under consideration.

This language was not misunderstood by Herbert Hoover, Federal representative, who participated in the negotiation of the compact. He was Chairman of the Colorado River Compact Commission. On March 2, 1923, he transmitted a report of the proceedings of the Commission and of the compact to the Speaker of the House of Representatives (Doc. 605, 67th Cong., 4th sess.). In his letter of transmittal he stated:

"Due consideration is given to the needs of each basin, and there is apportioned to each 7½ million acre-feet annually from the flow of the Colorado River in perpetuity, and to the lower basin an additional million feet of annual flow, giving it a total of 8½ million acre-feet annually in perpetuity."

It will be noted that he used the word "apportioned" as applying both to the 7½ million acre-feet provided for the upper and lower basins and to the additional million acre-feet of annual flow for the lower basin. He also stated that the apportionment of these two amounts was an apportionment of a total of 8½ million acre-feet annually to the lower basin.

The Supreme Court of the United States supports the contention which we here make. In *Arizona* v. *California* (292 U. S. 341), the Court did not sustain Arizona's claim that the million acre-feet covered by III (b) water was specifically apportioned to Arizona alone. However, this same case held that III (b) water was apportioned to the lower basin. It also held that there is no ambiguity in article III (b) of the compact. It, accordingly, overruled the contention which California now makes that III (b) water is unapportioned. As we shall later show, under the California self-limitation statute, even though the compact does not apportion the million acre-feet specifically to Arizona, the effect of the compact in connection with that statute is to make such water available only to Arizona.

On page 358 of the Supreme Court case cited above, it is stated (***Arizona*** v. *California*, 292 U. S. 341, p. 358, sixth ground):

"Sixth. The considerations to which Arizona calls attention do not show that there is any ambiguity in Article III (b) of the Compact. Doubtless, the anticipated physical sources of the waters which combine to make the total of 8,500,000 acre-feet are as Arizona contends, but neither Article III (a) nor (b) deal with the waters on the basis of their source. Paragraph (a) apportions waters 'from the Colorado River system,' i. e., the Colorado and its tributaries, and (b) permits an additional use 'of such waters.' The Compact makes an apportionment only between the upper and lower basins; the apportionment among the states in each basin being left to later agreement. Arizona is one of the states of the lower basin, and any waters useful to her are by that fact useful to the lower basin. But the fact that they are solely useful to Arizona, or the fact that they have been appropriated by her, does not contradict the intent clearly expressed in Paragraph (b) (nor the rational character thereof) to apportion the 1,000,000 acre-feet to the states of the lower basin and not specifically to Arizona alone. It may be that, in apportioning among the states the 8,500,000 acre-feet allotted to the lower basin, Arizona's share of waters from the main stream will be affected by the fact that certain of the waters assigned to the lower basin can be used only by her; but that is a matter entirely outside the scope of the Compact."

The Boulder Canyon Project Act, passed by the Congress in 1928, which provided for the approval of the Colorado River compact, included a section IV (a) which required California to pass what has been called a self-limitation statute. The effect of this statute, subsequently passed by the California Legislature, is to limit California's use of Colorado River water under the Colorado River compact. The act provided that it should not take effect, and there should be no authority exercised under it and no moneys expended in connection with the works authorized by the act, until California passed such a statute.

The act further provided that it would not be effective unless within 6 months

the compact was ratified by all of the signatory States; or if not, by such unanimous ratification, until six of such States, including the State of California, had ratified the compact and consented to waive the provisions of the compact requiring approval by all six States. The act further specified that as a condition to its becoming effective, California "by act of its legislature, shall agree irrevocably and unconditionally with the United States and for the benefit of the States of Arizona, Colorado, Nevada, New Mexico, Utah, and Wyoming, as an expressed covenant and in consideration of the passage of this Act, that the aggregate annual consumptive use (diversions less returns to the river) of water of and from the Colorado River for use in the State of California, shall not exceed four million four hundred thousand acre-feet of the waters apportioned to the Lower Basin States by paragraph (a) of Article III of the Colorado River Compact, plus not more than one-half of any excess or surplus waters unapportioned by said Compact, such use always to be subject to the terms of said Compact."

It is my opinion that the statute passed in 1929 by California in conformity with this provision of section IV (a) of the Boulder Canyon Project Act limits California to 4,400,000 acre-feet of water, plus one-half of the water unapportioned by paragraphs (a) and (b) of article III of the compact, exclusive of any water apportioned to Mexico by treaty. California, on the other hand, through its contention that water covered by paragraph (b) of article III is unapportioned water, takes the position that III (b) water is available as a part of excess or surplus water for use in the lower basin, including California.

We believe that we have shown that III (b) water is apportioned and that the only surplus or excess water is that specified in III (f) as being unapportioned by paragraphs (a), (b), and (c) of the compact.

Section IV (a) of the Boulder Canyon Project Act and the California statute on the subject clearly specify that the aggregate annual consumptive use "of water of and from the Colorado River for use in California" should not exceed 4,400,000 acre-feet of III (a) water, plus not more than one-half of the water unapportioned by the compact. This share of the apportioned water and of the unapportioned water makes up the total water supply which, under the compact and the self-limitation statute, is available to California from the Colorado River. III (b) is not included in the amount which may be used in this specification in California but, on the contrary, is expressly excluded from such use.

By the passage of the self-limitation statute, California renounced any claim to more than 4,400,000 acre-feet of water apportioned to the lower basin by the Colorado River compact, plus one-half of unapportioned water. Apparently, to get around this limitation, California now attempts to increase the amount of unapportioned excess or surplus water so as to include the water covered by paragraph (b) of article III of the compact. She thereby recognizes that unless she can sustain her claim that III (b) water is unapportioned, she must abide by the limitation in the use of III (a) water, plus the share of unapportioned water.

It must be noted in this connection that the confluence of the Gila River with the Colorado is so far down, no part of it can be used in California.

BENEFICIAL CONSUMPTIVE USE OF WATER UNDER THE COLORADO RIVER PROJECT

This is the second point, the question of the beneficial consumptive use of water under the Colorado River compact, which I am discussing.

It is contended by witnesses for California before this committee that beneficial consumptive use of water of the Gila River in Arizona is not measured by depletion of the virgin flow of the river at its confluence with the Colorado River, but is equal to the various increments of consumptive use at the points of use. If this principle is valid, it could be contended by California that it applied to the Upper Basin.

Technical phases of this subject will be discussed by other witnesses. The determination of this matter affects the amount of water which is available to Arizona, under the provisions of the Colorado River compact, to the extent of over 1,000,000 acre-feet.

Article III of the compact, which apportions water between the two basins makes such apportionment for "beneficial consumptive use." Beneficial consumptive use, as applied to the compact, is nowhere defined in that document. An effort should first be made to determine the intended meaning from the com-

91190—49—ser. 11, pt. 1——17

pact itself. Patent evidence of what was intended by the States in making the compact is shown by article III (d), which provides:

"The States of the upper division will not cause the flow of the river at Lee Ferry to be depleted below an aggregate of 75,000,000 acre-feet for any period of 10 consecutive years reckoned in continuing progressive series beginning with the first day of October next succeeding the ratification of this compact."

It will be noted that in specifying the measure of beneficial consumptive use of the water apportioned by the compact to the upper basin, depletion at Lee Ferry was used. It cannot be assumed that a measure of beneficial consumptive use would be used for the upper basin differently from that for a large tributary of a river, such as the Gila. The use of the phrase, we believe, would be applied consistently throughout the compact.

Since the use of the term by the compact is not defined therein and because of the importance of its application, resort may be had to statements and documents concerning the compact which were available to the governments of the States in ratifying the compact. The minutes of the Colorado River Compact Commission are extremely enlightening on this subject.

Here I quote from Reuel Leslie Olson, and Reuel Leslie Olson prints a large part of the minutes in the back of his book. The Colorado River Compact, These statements no doubt are taken from them. At page 35, Mr. Olson states:

"The phrase 'exclusive beneficial consumptive use' and the world 'apportion' used in Article III, paragraph (a), defining the right of the Basins, gave great concern to the Commissioners. The first one of these terms, the phrase 'exclusive beneficial consumptive use' was taken by some of the Commissioners to raise the legal problem of whether or not representatives of the separate States could apportion or divide the corpus of the water. The second was selected to express the idea of division of the water between the Upper Basin and the Lower Basin because several of the Commissioners believed that its connotation was somewhat different from the meaning suggested by other terms. It was thought that the word 'apportioned' did not imply appropriation and therefore did not raise the question of whether or not the interstate agreement would have any effect upon the existing system of vesting of water rights by appropriation under State law in the several States of the Colorado River area.

"* * * It caused much argument at the time the Compact was drafted, and in the minutes of the meetings of the Commission we find remarks forewarning us * * * of the controversy."

On page 36, we find this further statement on the subject: by Olson:

"The Commissioners sought to use language in the Compact which would avoid the issue. The phrase 'beneficial consumptive use' was decided upon as the most nearly satisfactory expression. It was supplemented by a statement inserted in the official records of the proceedings to the effect that 'the States of the upper division * * * wish to state affirmatively * * * that it is the understanding that the use of the language in Article III constitutes no waiver on their part or on the part of any one of them to any claim of ownership which they may have to the corpus of the water or any recognition of any right or claim on the part of the United States to the corpus of any of the unappropriated water of the stream, it being the understanding of these States that the language used is the medial ground which in no way raises or affects the title of ownership.' This was subsequently adopted as the statement of all of the Commissioners."

The extended discussion of the matter appears from the Colorado River Commission minutes of the twenty-second meeting, November 1922, Bishop's Lodge, Santa Fe, N. Mex. Reference is made to the minutes on this subject, and as indicative of the discussion in support of the statement made by Mr. Olson, may I quote as follows:

"Chairman HOOVER. The whole proposition here is whether you are going to divide the corpus of this water or whether you are going to divide the use. If you are going to divide the corpus of the water you are going to be in a mighty lot of trouble before the Federal Government. If you are going to divide the use of the water, I don't see any difficulties in the matter at all. Now if you are going to divide the corpus of the water you are going to adopt the extreme State view. If you are going to the other extreme and adopt the extreme Federal view you would acknowledge in this pact the unappropriated water belonged to the Federal Government and that by this act the Federal Government consented to transfer its rights to the States and it would never get through Congress.

"The question is to find a medial ground which does not have either extreme,

and finding that ground on the ground of use has struck me all along as being the medial ground which doesn't raise the question. If you are going to take Mr. Carpenter's view you are going to divide the corpus of the water. That is a contention I don't think the Federal Government would be inclined to stand for. It is not for me to decide, it is purely for you."

This conception of the reason for the use of the term "beneficial consumptive use" by the Colorado River compact, coupled with resort in the compact to "depletion" by article III as the measure of beneficial consumptive use in the upper basin, demonstrates that it is unjustified, unreasonable, and not in accordance with the compact to measure beneficial consumptive use of the Gila River in any manner other than by depletion at its mouth.

Mr. Howard, in his statement before this committee, quotes from the State of Colorado's views and comments on the Colorado River report of the Bureau of Reclamation. These Colorado statements are not inconsistent with the position which we take here. It is a technical matter which will be explained by engineering witnesses.

I might add Mr. Tipton will go into the matter in some detail.

Mr. Howard, in his statement before this committee, said that the phrase "beneficial consumptive use" is a "common one and well understood in water law as meaning diversions from a river minus return flow to the river." We most emphatically disagree with this statement.

From actual experience in compact making on other rivers, I know that the definition of "beneficial consumptive use" and the method of determining such use varies to apply to the specific conditions which are dealt with in a compact. The phrase has a very technical meaning and has been the subject of much study and discussion by the engineering profession. The technical use of the term is not well defined in the law. We do not believe that such technical use was understood or considered by the commissioners when they negotiated the Colorado River compact, nor by the States when it was ratified.

On the contrary, we have here submitted from the minutes of the compact commissioners what they had in mind when they considered the use of the term, and the only measure evidenced by the compact itself of beneficial consumptive use is that of depletion.

Then, in conclusion, the Congress, we believe, will not approve an unconscionable position in interpreting the Colorado River compact for the purposes of proposed legislation. Nor would a court give approval to any interpretation of a solemn agreement among States which would be inequitable. It cannot be assumed that the compacting States intended to apportion water between the upper and lower basins of the Colorado River by terms and conditions, the interpretation of which would limit one of the States to its existing uses of water when the compact was made with a comparatively small opportunity for future development. We submit that the States did not do so.

California, under the compact, has proceeded with extensive development. California, according to the statements made before this committee, now claims that there is no water for the proposed central Arizona project or any other water development—future development, I mean—in the State. The California spokesmen arrive at this conclusion through the interpretations of the Colorado River compact which they asked this committee to accept. May I submit that if these interpretations are approved by this committee or should be approved in the future by a court, the terms of the Colorado River compact would be held to deny one of the signatory States an equitable share of Colorado River water.

STATEMENT OF R. J. TIPTON, CONSULTING ENGINEER FOR THE STATE OF ARIZONA AND CENTRAL ARIZONA PROJECT ASSOCIATION

Senator MILLIKIN. Mr. Tipton, will you take a seat, and give the reporter your name, residence, and business.

Mr. TIPTON. Yes, sir.

My name is R. J. Tipton. I am a consulting engineer from Denver, Colo. I am appearing at this hearing in behalf of the State of Arizona and the Central Arizona Project Association. Among my clients is the Colorado Water Conservation Board for which I am consulting engineer. I am appearing with the full knowledge of responsible officials of the State of Colorado, including the Governor. I have no knowledge of the physical features or merits of the central Arizona project. My statement will be confined to a discussion of water supply and its availability under the Colorado River compact and related documents.

The statement of Mr. James H. Howard, presented to the committee on June 28, makes it necessary for me, in behalf of the State of Colorado, to correct certain impressions which he left with the committee as to Colorado's interpretation of some of the matters which affect the water supply available under the compact to the upper basin as well as to Arizona.

He quoted statements which I made in connection with the Mexican water treaty hearings and quoted from an official report of the State of Colorado which commented on the Colorado River Basin report of the Bureau of Reclamation. The Colorado report was signed by the Governor of the State of Colorado; Clifford H. Stone, director of the Colorado Water Conservation Board; C. L. Patterson, chief engineer of the board; Jean S. Breitenstein, attorney for the board; and myself as consulting engineer of the board. The interpretations which Mr. Howard accredited to me and to the State are directly opposed to the State's interpretation and my interpretation of the matters involved.

In my statement I desire to discuss the following phases of the problem: (1) Beneficial consumptive use; (2) water supply of the Colorado River Basin and the amount available for use by Arizona; and (3) the California situation.

Beneficial consumptive use as it is used in the Colorado River compact is interpreted by California to mean the aggregate of all the individual items of consumptive use at the points of use. Arizona interprets the term to mean depletion of main stream Colorado River water as a result of man's activities.

By California's interpretation, all of the water salvaged by man on tributaries of the Colorado River by converting natural losses to beneficial use would be charged against the amount of the basin's apportionment and against the State's equitable shares of such apportionment, this in spite of the fact that water so salvaged under virgin conditions never did reach the main stream and never could have been used by any other water user in the Colorado River Basin except the one who salvages the water.

Simply stated, California's position is that the upper basin's 7,500,000 acre-feet of annual beneficial consumptive use apportioned by the compact shall be determined by adding up all of the small increments of consumptive use along all of the tributaries, large and small, in the upper basin, each increment of consumptive use to be ascertained by the measurements of diversions from the stream and by deducting from the amount of the diversions the returns to the stream from which each individual diversion is made. California's interpretation would involve the measurements of the thousands of diversions in the upper basin and the measurements of the thousands of returns to the stream from the lands irrigated by those diversions.

The State of Colorado's position is that the upper basin under the Colorado River compact has the right to deplete the virgin flow of the Colorado River at Lee Ferry by 7,500,000 acre-feet annually. This difference in interpretation means a difference in the estimated water supply available to Arizona under the compact and related documents of over 1,000,000 acre-feet, all of which difference is involved in the application of the two interpretations to the use of water on the Gila River. In the upper basin a substantial amount of water is involved.

Mr. James H. Howard, in his statement, assumed the problem to be a simple one. He stated:

"No definition of the phrase 'beneficial consumtive use' is found in the compact, presumably because the term is a common one and well understood in water law as meaning diversions from a river minus return flow to the river. The words 'consumptive use' have been defined in other documents relating to the Colorado River."

Mr. Howard makes this statement despite the fact that the Supreme Court of the United States in an important interstate water case interpreted evidence with respect to consumptive use to mean to divert, take, and use. When in a subsequent case it was sought to have the Supreme Court interpret its decision, the Supreme Court said that it meant gross head-gate diversion, so apparently there is some legal confusion about the legal meaning of the term.

From an engineering standpoint, the conception of consumptive use as it affects the flow of the stream has gradually gone through a process of evolution since the term was first coined in the suit over the uses of water of the Laramie River, *Wyoming* v. *Colorado*. Much work is still being done on this subject by engineers who are studying the problem in various river basins.

In my discussion concerning the meaning of "beneficial consumptive use" as it appears in the Colorado River compact, I shall approach the problem, first, on the basis of intent of the Colorado River Compact Commissioners at the

time the Colorado River compact was negotiated and, second, on the basis of the technical conception of consumptive use at the present time and the evolution which has brought about such conception.

The Colorado River Compact Commission at the time it apportioned the water between the two basins——

Senator MILLIKIN. Is it your contention that we should be governed by the present as distinguished from the then current conception of the meaning of the words "consumptive use"?

Mr. TIPTON. No. It is my position that we should be governed by the conception that the Colorado River Commission had of the term and the intent that the commission had in apportioning the water.

Senator MILLIKIN. What is the relevancy of the present conception of the words?

Mr. TIPTON. The reason for bringing that into the discussion, Mr. Chairman, is to make clear the meaning of Colorado's comments on the Colorado River report by the Bureau of Reclamation, which Mr. Howard quoted.

In my oral presentation, I need not dwell on the technical conception if it seems desirable, in order to save time—I mean during the hearing. But that is the only purpose.

Senator MILLIKIN. Proceed please.

Mr. TIPTON. The Colorado River Compact Commission at the time it apportioned the water between the two basins was not thinking in terms of the technical meaning of "beneficial consumptive use" when it used such term in the compact. The commission used the term for legal reasons. The Colorado River compact commissioners were thinking in terms of dividing between the basins the virgin (termed by them reconstructed flow) of the river in the amount estimated at or near the international boundary. The 7,500,000 acre-feet apportionment to each basin was from the virgin flow at Lee Ferry. The Colorado River Compact Commission in considering the consumptive use of the Gila River was thinking in terms of the depletion of the river at the mouth. The Colorado River Compact Commission, when considering consumptive use in the upper basin was thinking in terms of the depletion of the flow of the river at Lee Ferry. The above conclusions with respect to the intent of the commission are plainly indicated in the minutes of the various meetings of the commission.

I am submitting herewith as appendix A excerpts from the minutes of the seventeenth meeting held in Santa Fe, N. Mex., on November 15, 1922, and the minutes of the eighteenth meeting held at the same place on November 16, 1922, all of which contain the discussion of the commission when it was considering the division of the water of the Colorado River.

In my discussion I wish to quote a portion of the minutes which show plainly the intention of the commission. The emphasis is supplied by me by underlining in the quotations as well as in the appendix.

Senator MILLIKIN. Is that excerpt similar to the one Judge Stone mentioned?

Mr. TIPTON. No, sir. It is entirely different.

Senator MILLIKIN. Proceed please.

Mr. TIPTON. The commission in its attempt to estimate the virgin flow of the river gave consideration to the recorded flow at Laguna, which was a gaging station on the river below the old Laguna Dam diversion and above the old Imperial diversion. In its studies the commission chose to add to that flow the consumptive use of the upper basin and the consumptive use in the Gila Basin plus its outflow at the mouth. At an early point in the minutes which I am attaching, the following statements were made:

"Mr. HOOVER. Then the problem also goes into the consumptive use in the upper basin. In order to reconstruct the river the consumptive use in the upper basin must be taken into account. It is true that the Laguna gagings include the Imperial Valley?

"Mr. A. P. DAVIS. Yes."

It may be noted that Mr. Hoover stated that in order to reconstruct the river the consumptive use in the upper basin must be taken into account. I quote the folowing from the minutes:

"Mr. HOOVER. And if you were to reconstruct the river you must also take account of the consumptive use of the upper basin and add that to the Laguna gagings, and ought to add also the Gila flow. Have you a rough idea as to what the flow of the Gila would be if it had not been used for irrigation, or what the consumptive use, plus the present flow, is?

"Mr. A. P. DAVIS. I can estimate that fairly closely. The mean annual flow as

measured during the last 20 years is 1,070,000 acre-feet. The areas that are irrigated there are given in this document, 142, and we can apply a duty of consumptive use of water on that area and approximate fairly well, I believe, the consumptive use in the Gila Basin, if that is what is wanted.

"Mr. HOOVER. My only point on that is, Does it approximate, possibly, the amount of consumptive use in the upper basin?

"Mr. A. P. DAVIS. Oh, no. It is smaller. The consumptive use in the upper basin is on that table I gave you.

"Mr. HOOVER. About 2,400,000?

"Mr. A. P. DAVIS. In 1920 the consumptive use was about 2,400,000 acre-feet.

"Mr. CARPENTER. This is a progressive increase from 0 up?

"Mr. A. P. DAVIS. Yes.

"Mr. CARPENTER. You would think the Gila consumptive use would be something over a million and a half feet?

"Mr. A. P. DAVIS. Very likely less than a million and a half. But I am not sure about that till I figure on it a little.

"Mr. CARPENTER. In other words, there might be——

"Mr. A. P. DAVIS (interrupting). There would be a good deal less.

"Mr. CARPENTER. There might be, then, a million acre-feet to go into this calculation for translating back from Laguna gagings?

"Mr. A. P. DAVIS. To include the Gila; yes. It doesn't seem like it would apply to the Little Colorado as its contribution is offset by evaporation. There is very little outside the Gila Basin that is not thus offset.

"Mr. CALDWELL. Mr. Davis, just where is the Gila measured?

"Mr. A. P. DAVIS. There have been different points; one at Dome.

"Mr. CALDWELL. Tell me where it is with respect to the mouth?

"Mr. A. P. DAVIS. Dome is about 12 miles above the mouth, and that was changed on account of difficulties of measurement, but not very materially.

"Mr. CALDWELL. This million seventy thousand you speak of is an average flow, is it?

"Mr. A. P. DAVIS. Yes.

"Mr. CALDWELL. Average annual flow over how many years?

"Mr. A. P. DAVIS. Eighteen years, I believe. It is all published in Senate Document 142."

Particular attention is directed to Mr. Hoover's question where he asked Mr. Davis:

"Have you a rough idea as to what the flow of the Gila would be if it had not been used for irrigation, or what the consumptive use, plus the present flow, is?"

It is significant that Mr. Hoover's intent was to determine what the flow of the river would have been to the Colorado River had there been no irrigation on the river. He considered consumptive use and depletion as synonymous because he suggests that the flow before irrigation would be the consumptive use plus the present flow (at the mouth). This is subsequently made plain.

Attention is directed particularly to Mr. A. P. Davis' statement to the effect that:

"It doesn't seem like it would apply to the Little Colorado, as its contribution is offset by evaporation. There is very little outside the Gila Basin that is not thus offset."

In other words, the commission in estimating the amount of water available for apportionment was not considering any of the water which did not reach the main stream of the Colorado River, and as a matter of fact in considering any contributions that in the virgin state did not reach Laguna and the mouth of the Gila.

I call attention to the following statement by Mr. Hoover taken from the minutes of the meeting as shown in appendix A:

"Mr. HOOVER. What would be added here, as a rough guess, would be the flow and consumptive use of the Gila and Little Colorado and the consumptive use of the Colorado below Lee Ferry and above Laguna. This all comes to about a million and a half, and the consumptive use in the upper basin is 2,400,000 so it would be a credit of water to the Laguna readings of approximately a million feet, something like that."

He considers that the flow of the Gila River plus the contribution of the Little Colorado, plus the consumptive use of the Colorado below Lee Ferry and above Laguna amounted to about 1,500,000 acre-feet. Mr. Davis had already stated that the Little Colorado contributed nothing and that there was very little contribution except by the Gila. It is apparent, therefore, that the 1,500,000 acre-feet

which the commission was to add to the flow at Laguna was to represent the virgin flow of the Gila River made up of 1,070,000 acre-feet at the mouth (at Dome, about 12 miles above the mouth) plus approximately 500,000 acre-feet of consumptive use. It is interesting in view of information we now have to check Mr. Davis' estimate of the consumptive use on the Gila and of its virgin flow.

Table CXLVI on pages 284 and 285 of the March 1946 report of the United States Department of the Interior and the Bureau of Reclamation report on the Colorado River shows the estimated virgin flow of the Gila River at the mouth. This is shown in the last column in the table. For the 18 years mentioned by Mr. A. P. Davis, the estimated virgin flow was 1,920,000 acre-feet. This may be compared with the 1,500,000 acre-feet mentioned by Mr. Hoover, cited above. In further explanation of the 1,920,000 acre-feet, that is merely the arithmetical mean of the 18 years mentioned as taken from the last column of the table which was cited as appearing in the Bureau's 1946 report.

In from the 1,920,000 acre-feet there is subtracted Mr. Davis' estimate of the flow of the Gila at the mouth, there results the value of 850,000 acre-feet of indicated depletion of the Gila River at the mouth for the 18-year period.

And at that point I might say that the 850,000 acre-feet would be Colorado's interpretation of the beneficial consumptive use on the Gila at that time, using more complete estimates that are available to us as to the virgin flow which occurred for the 18-year period.

The mean annual total water supply at the point of use in central Arizona for the same 18-year period is indicated by values in the table to have been 3,100,000 acre-feet.

This, again, is an arithmetical mean of the values, appearing in the Bureau's table.

By the California interpretation, the consumptive use in the Gila River during the 18-year period would have been 2,030,000 acre-feet. This may be compared with the 850,000 acre-feet arrived at above. It may be noted that the difference in the Gila consumptive use arrived at by the one interpretation as opposed to the other interpretation again is something over 1,000,000 acre-feet. It does not appear that the commission was interpreting "consumptive use" in the same fashion that California is.

The following is quoted from the minutes which appear in appendix A:

"Mr. HOOVER. I should think for matters of discussion we could take it that the reconstructed mean at Lees Ferry is a minimum of 16,400,000 and perhaps, with this elaborate calculation, half a million above, i. e., 17,000,000. Therefore we would come to a discussion of a 50–50 basis on some figure lying between 16,400,000 and 17,000,000.

"Mr. S. B. DAVIS. With all due respect to these eminent gentlemen, I am still from Missouri, I have to be shown, but I am willing to enter into a discussion on that line.

"Mr. HOOVER. I should think the result of the deliberations and of our advices on that matter have been to establish the 16,000,000 as a sort of least mean.

"Mr. S. B. DAVIS. As the average mean at Lees Ferry.

"Mr. HOOVER. Yes; and that an apportionment of a minimum would be half that sum, 8,200,000 acre-feet instead of the 6,260,000 feet as suggested by Mr. Carpenter—so that this would be the question of your proposal, delivering approximately 82,000,000 acre-feet in 10-year blocks."

It may be noted that the commission, after going through the various calculations to reconstruct the flow of the river at Lee Ferry, arrived at a minimum estimate of 16,400,000 acre-feet per year which Mr. Hoover mentioned might be as high as 17,000,000 acre-feet. At that point in the deliberation, the commission was considering a 50–50 division of the water supply. Mr. Hoover, therefore, suggested an apportionment of a minimum of the 8,200,00 0acre-feet to the lower basin, which was one-half the estimated minimum reconstructed flow at Lee Ferry of 16,400,000 acre-feet.

It is apparent, therefore, at this point the commission was engaged in apportionment of the virgin flow of the river between the two basins. The final apportionment so far as the division of the water at Lees Ferry is concerned was made on that basis as evidenced from the following discussion quoted from the minutes which appear in appendix A:

"Mr. HOOVER. In our discussions yesterday we got away from the point of view of a 50–50 division of the water. We set up an entirely new hypothesis. That was that we make, in effect, a preliminary division pending the revision of this compact. The seven and a half million annual flow of rights are credited to the

south, and seven and a half million will be credited to the north, and at some future day a revision of the distribution of the remaining water will be made or determined.

"An increasing amount of water to one division will carry automatically an increase in the rights of the other basin and therefore it seemed to me that we had met the situation. This is a different conception from the 50–50 division we were considering in our prior discussions.

"Mr. NORVIEL. If this includes reconstruction of the river, then, I concede it is a more nearly fair basis. But if it does not—if it is a division of the water to be measured at the point of demarcation, I still insist that it is not quite fair, because it is simply dividing what remains in the river.

"Mr. HOOVER. We are leaving the whole remaining flow of the basin for future determination.

"Mr. NORVIEL. What I am getting at is this: That the upper basin takes out and uses a certain amount of water, and as this reads, it proposes to divide the rest of it, 7,500,000 acre-feet per annum.

"Mr. HOOVER. No.

"Governor CAMPBELL. That is inclusive, Mr. Norviel.

"Mr. NORVIEL. It reconstructs the river?

"Governor CAMPBELL. Yes; in effect, as I understand it.

"Mr. NORVIEL. Well, if it does that, then my objection will be removed.

"Mr. HOOVER. Any other comment? If not, all those in favor of this clause 7 as read please say 'Aye.'

"(Thereupon a vote having been taken upon the paragraph No. 7, the same was unanimously passed.)"

It may be noted that 7,500,000 acre-feet was apportioned to each basin from the reconstructed flow of the river at Lee Ferry. Mr. Norviel was concerned because he feared that the discussion related to the division of the flow of the river at "the point of demarcation" (Lee Ferry) without its being reconstructed or brought to virgin conditions. When he was assured that the intent was to apportion the reconstructed flow of the river in terms of 7,500,000 acre-feet to each basin, he stated that he would remove his objections. The commission then unanimously voted to adopt such apportionment.

Judge Stone has already shown that the Colorado River Compact Commission used the words "beneficial consumptive use" in the compact to avert implying that the commission was dividing the corpus of the water. The use of the term was for legal reasons and had nothing to do with the technical conception of consumptive use at the present time. In the interest of saving time I shall not read all my discussion on the present technical conception of consumptive use.

Senator MILLIKIN. You might state the end point, Mr. Tipton.

Mr. TIPTON. Summarizing then, it is recognized by definition that there is "farm consumptive use," there is "project consumptive use," there is "valley consumptive use," and there is "basin consumptive use."

Consumptive use is measured by inflow to an area minus outflow from the area; for a farm, consumptive use is diversions minus the return; for a project area, it is the diversions by the main canals minus the return; for a valley, it is the inflow to the valley minus the outflow. For a basin it is likewise the inflow minus the outflow.

The man-made consumptive use or depletion within incremental areas will reflect itself at the mouth of a valley or a basin as depletion, and the difference between the consumptive use of a valley in the virgin state as evidenced by the inflow minus the outflow, and the consumptive use after man has developed the valley evidenced by the then inflow minus outflow represents the beneficial valley consumptive use.

Valley consumptive use so measured is a smaller item than the sum of the incremental consumptive uses in the valley because of the salvaging of water. The same is true for the basin as a whole. The basin consumptive use is less than the sum of the valley consumptive uses on account of the salvaging of water within the valleys which never did reach the mouth of the basin under virgin conditions.

That is, virtually, the substance of my technical concept, the depletion factor of consumptive use. In the middle of page 15 of my written statement is the sentence "Valley consumptive use is determined by measuring inflow to the valley and deducting the outflow."

At that point I desire to submit a definition which appears in the Report of the Joint Investigation on the Upper Rio Grande to make the problem somewhat

clearer. I will not read it at this time but, with the chairman's permission, I would like to submit that as part of my testimony.

Senator MILLIKIN. All right.

Mr. TIPTON. I shall resume, then, reading my written statement.

To get further insight to the Commissioner's thinking, I wish to quote an excellent statement of Mr. Delph Carpenter's made at the eleventh meeting of the commission held in Santa Fe on November 11, 1922:

"Mr. CARPENTER. When you proceed to reduce the adjustment to one of a definite fixing of quantities, or limitations of use as to each State, you have to proceed to a degree of refinement that is hazardous and at this time calls for a knowledge which no man possesses.

"We do not have and cannot obtain, except by long years of study hereafter, basic data upon which to work. Between States in either of these great divisions very different principles should be applied on each different and distinct river, and may have to be applied. The facts are different. *For illustration, some of the rivers rise in the mountains to wither away on the plains before they reach the lower States within a division.* Others are increasing rivers as they flow out from their original source. The territory is new, the conditions will develop and if allowed to develop naturally will call for the ultimate solution between the interested States as respects any particular river.

"In preparing the draft which I have submitted, I first proceeded upon the theory of the individual allocation. My advisers and I myself found ourselves in the position of saying that, as respects a virgin territory, we would be called upon to fix an artificial limitation that might work great injustice later. The river is new, the territory is new, and thereby, after studying stream after stream that flowed out from the mouth, it became evident that *it would be unwise and imprudent to attempt to deal definitely with each detailed river, each individual tributary stream.*

"Proceeding upon that hypothesis, or proceeding upon that conclusion, it became then a problem of seeing if it could not be worked out on *a divisional basis, that division basis largely having been fixed by nature.* We have a great catchment basin like the receptacle basin of a funnel; we have the funnel neck, the canyon, and below the territory that receives the water through this funnel neck with certain additional supplies arising and flowing in that territory, so, in order to attempt to work the problem out and avoid the conflict that would invariably be provoked in this council if you were to attempt to go into detail with respect to each State, it was thought by us more prudent to strike at the root of the whole problem on *a divisional allocation of the waters of the river.*"

The italics are mine.

Mr. Carpenter's statement concerning some rivers which rise in the mountains and wither away on the plans before they reach the lower States within a division is quite significant. It appears that he recognized the waters of such rivers were not available for apportionment among the States. He came to the conclusion that it would be unwise to deal with each detailed river and each individual tributary stream and that there should be a divisional allocation of the waters of the river. He described the physical conditions of the canyon section between the two basins which made such a divisional allocation practicable.

It is my conclusion that the Colorado Compact Commission did apportion the virgin flow of the Colorado River and that it is considered beneficial consumptive use to be synonymous with depletion at Lee Ferry and that it did consider consumptive use on the Gila to be synonymous with the depletion of the Gila River flow at the mouth.

From a technical standpoint, consumptive use is the amount of water consumed by plants plus the incidental evaporation that takes place due to the irrigation of the plants. Consumptive use includes both the consumption of rainfall and the depletion of stream flow. On a short-time basis, it may also involve a change in ground water from one season to the next. For the purpose of this discussion, I shall consider only that part of conspumptive use which causes stream depletion due to man's activities. That is the element of consumptive use with which we are concerned and with which the Colorado River Commission was concerned at the time the compact was negotiated.

Since the term was first coined, engineers have given much study to consumptive use, its effect, and means of measuring it. A technical subcommittee of the irrigation division of the American Society of Civil Engineers gave some attention to the problem in the middle 1920's. This committee recognized the difference between consumptive use as applied to various sizes of areas ranging from

individual farms to an entire valley. During the hearings in the last Arkansas River Supreme Court suit in the 1930's, *Colorado* v. *Kansas*, it was fully recognized that basin consumptive use was not equal to the sum of all the increments of consumptive use in the basin. It was recognized that a material salvage of water takes place as a result of the irrigation of a basin. Much work along the same line has been done since that time.

By definition, there is farm consumptive use, project consumptive use, valley consumptive use, and basin consumptive use. Farm consumptive use is the amount of stream flow actually consumed by plant growth and burned up by incidental evaporation on the farm. Project consumptive use represents the amount of water consumed on the project which causes depletion of the stream flow between the head of the project and the point where the return flow reaches the stream. In general, consumptive use, aside from rainfall, and disregarding annual change in ground water, is determined by measuring the inflow to an area and deducting the outflow.

For example, farm consumptive use is measured by deducting the flow of water leaving the farm from the diversion to the farm. This is ordinarily difficult because some of the return from the farm reaches the ground water and is not susceptible of measurement as it passes th boundaries of the farm.

Project consumptive use is measured by measuring the diversion through the main canals to the project and deducting therefrom the measured returns in drainage canals and waste ditches crossing the project boundaries.

Valley consumptive use is determined by measuring inflow to the valley and deducting the outflow.

"The following definitions are quoted from page 88 of Regional Planning, Part VI—Upper Rio Grande, February 1938, National Resources Committee.

" 'Definitions: The following definitions of consumptive use were used by the Bureau of Agricultural Engineering in its study:

" 'Consumptive Use (evapo-transpiration): The sum of the volumes of water used by the vegetative growth of a given area in transpiration or building of plant tissue and that evaporated from adjacent soil, snow, or intercepted precipitation on the area in any specified time.

" 'Valley consumptive use: The sum of the volumes of water absorbed by and transpired from crops and native vegetation and lands upon which they grow, and evaporated from bare land and water surfaces in the valley; all amounts measured in acre-feet per 12-month year on the respective areas within the exterior boundaries of the valley.

" ' The valley consumptive use (K) is equal to the amount of water that flows into the valley during a 12-month year (I) plus the yearly precipitation on the valley floor or project area (P) plus the water in ground storage at the beginning of the year (G_s) minus the amount of water in ground storage at the end of the year (G_e) minus the yearly outflow (R); all amounts measured in acre-feet. The consumptive use of water per acre of irrigated land is equal to (K) divided by irrigated area (A_1); and consumptive use per acre of the entire valley floor is equal to (K) divided by the entire valley area. The unit is expressed in acre-feet per acre.

" 'Stream-flow depletion: The amount of water which annually flows into a valley, or upon a particular land area (I), minus the amount which flows out of the valley or off from the particular land area (R) is designated 'stream-flow depletion' ($I-R$). It is usually less than the consumptive use and is distinguished from consumptive use in the Rio Grande studies.'

"The report from which the above is quoted gives results of the so-called Rio Grande joint investigation which was participated in by all of the major Federal agencies interested in water development. The interested States—Colorado, New Mexico, and Texas—cooperated in the investigation.

"The report indicates consumptive use, set up as a formula to be as follows:

$$K=I-R+P+(G_s-G_e)$$

in which K is the consumptive use, I is the inflow to the area, R is the outflow from the area; P is the precipitation, G_s is the ground-water storage at the beginning of the period and G_e is the ground-water storage at the end of the period. In the equation, depletion is represented by $I-R$. The reason that depletion is usually less than consumptive use is apparent because consumptive use includes consumption of precipitation as well as depletion. Disregarding precipitation and change in ground-water storage, the equation indicates that consumptive use is synonymous with depletion. As I have indicated in my dis-

cussion, I am considering only that part of consumptive use which is represented by depletion.

"In a river valley the water supply is considered as the outflow from the valley. In the virgin state this would be considered the valley water supply. It is only reasonable to interpret valley consumptive use occasioned by man in terms of the depletion of the valley water supply as represented by the outflow from the valley."

Beneficial consumptive use by man in the valley from the valley standpoint is the difference between the valley consumption as it existed before man entered the valley and valley consumption as it existed after he made his water-consuming development. Valley beneficial consumptive use is a smaller amount than the aggregate of all the project and farm consumptive uses which is taking place within the valley. By like token the sum of all the valley beneficial consumptive uses within a basin is a larger quantity than basin beneficial consumptive use measured as the depletion of the outflow from the basin by man's activities within the basin. This is true because of the salvaging and putting to beneficial use water which was lost under natural conditions.

Two major sources for salvage exist. One is the reduction of stream flow losses by diverting and putting the water otherwise so lost to beneficial use. The other is the conversion of natural losses of river water occurring on raw land to beneficial use after the land is irrigated.

The first type of salvage can best be illustrated by reference to a hypothetical transmountain diversion in the upper Colorado Basin. Assume that such a diversion exports from the headwaters of the Colorado River 500,000 acre-feet of water per year. The exporting of such amount of water represents a depletion of tributary flow of 500,000 acre-feet at the immediate point of exportation. It could be considered so far as the Colorado River is concerned as project consumptive use in the full amount at that point. However, the diversion out of the basin of the 500,000 acre-feet would not deplete the flow of the river at Lee Ferry by 500,000 acre-feet because had this quantity been left in the river, some of it would have been lost in transit by natural processes.

Many areas of raw land in the upper basin of the Colorado River were consuming water from the tributaries of that river in the state of nature before these areas were irrigated. The same is true with respect to many areas that will be irrigated in the future. This is particularly true with respect to native meadowlands such as exist in the Green River Basin in Wyoming and along the upper tributaries in Colorado and Utah. In the state of nature large areas of these lands were perennially overflowed by the streams which caused them to consume water. When man entered the picture, built his ditches, and started to apply water to the land artificially, the consumption of river water by those lands may not have caused much more depletion of the stream than was taking place under virgin conditions. He was merely putting to beneficial use some of the water that was being dissipated by nature in the virgin state. The effect of man's activities in this case on valley consumptive use and basin consumptive use would be the extent to which he increased the depletion of the outflow from the valley and the outflow from the basin.

The salvage of water in the upper basin by these processes after ultimate development has been made may be a substantial item. Testimony already before the committee indicates the item in the Gila River Basin amounts to some million acre-feet per annum. If California's theory were accepted, she would ask that all the small incremental items of consumptive use in the upper basin which occur on the farms and on the projects be added up and that this be considered the beneficial consumptive use that was apportioned to the upper basin under article III (a) of the Colorado River compact. By such process she would be charging the upper basin with natural losses which the upper basin will have salvaged. This salvaged water never did reach the lower basin and never could have reached the lower basin in the state of nature. Nevertheless, California maintains that the equivalent of such salvage water shall flow past Lee Ferry in order to increase the amount of surplus or unapportioned water in the Colorado River Basin.

A hypothetical example may be given to show the effect of this on an individual State. Approximately 80,000 acres of native meadowland exists at the present time in the Green River Basin in the State of Wyoming. At the point of use these lands probably consuming in the order of 100,000 acre-feet of river water per annum. In the state of nature before man entered the picture those lands probably were consuming about 60,000 acre-feet per annum. Man therefore has increased the consumption of river water by 40,000 acre-feet. All of the

40,000 acre-feet of water which man's activities are causing to be lost at the present time at the point of use did not reach Lee Ferry in the state of nature because some of it was lost in transit. Under California's theory, there would be charged against Wyoming's equitable share of the water apportioned to the upper basin the total of 100,000 acre-feet now being consumed by the lands although the citizens of Wyoming caused the flow to the lower basin to be depleted by less than 40,000 acre-feet. California would charge Wyoming with all of the natural losses estimated at some 60,000 acre-feet on those particular lands which occurred before Wyoming was settled and some of the river losses between the meadowlands and Lees Ferry which existed under virgin conditions. A similar situation exists with respect to the other upper basin States.

On the other hand, during periods of protracted droughts should it become necessary for the upper basin to curtail the use of water in order to deliver the 75,000,000 acre-feet (at Lee Ferry) in a 10-year period in accordance with article III (d) of the compact, the curtailment must be in sufficient amount to make up the deficiency at Lee Ferry. The increments of consumptive use which are curtailed will in the aggregate exceed the deficiencies at Lee Ferry by the amount of channel loss required to get the water to Lee Ferry. California therefore in the one instance would not permit the upper basin to enjoy the use of the river losses it salvages, but in the other instance would require that the upper basin make up the river losses by curtailing the increments of consumptive use an amount sufficient to supply such losses.

Mr. Howard in his statement quotes from the Mexican Water Treaty hearings where I call attention to the fact that the treaty uses the term "consumptive uses." Such term was deliberately used in the treaty to include consumptive uses on the various tributaries of the stream.

I want to call particular attention to the use of the word in the plural, "consumptive uses." It was used so that neither deliveries nor basin consumptive use would be the controlling item when the extraordinary drought provision of the treaty is invoked.

Senator MILLIKEN. We will take a 5-minute recess.

AFTER RECESS

Senator MILLIKIN. All right, Mr. Tipton.

Mr. TIPTON. Such provision has no relation whatsoever to the apportionments of water made by the compact. The aggregate of the consumptive uses as used by me in connection with the treaty will be greater than the basin consumptive use because they include water salvaged which in the virgin state was lost by natural processes to the basin and did not reach Lee Ferry.

The same principle was recognized in Colorado's comments on the Colorado River report by the United States Bureau of Reclamation (project report No. 34-8-2). The Bureau underestimated the water supply that would be available to take care of the aggregate of the consumptive uses in the basin by the amount of water that would be salvaged when the basin is entirely developed. The Bureau made an estimate of the consumptive use by each individual project, then added these estimates together and compared the sum with its estimate of the virgin flow of the river at the international boundary in order to determine whether sufficient water was available to supply the quantity of water represented by the sum of the individual project consumptive uses. Colorado's comments pointed out the technical error involved in such a process. Various increments of salvaged water which do not appear as a part of the estimated virgin flow of the Colorado River at the international boundary will be available to take care of some of the consumptive use of those projects which are constructed. In my opinion, the basin beneficial consumptive use in the upper basin will reach a total of 7,500,000 acre-feet under the terms of the Colorado River compact when the depletion at Lees Ferry caused by man's activities equals 7,500,000 acre-feet. This will be less than the sum of the project consumptive uses in the basin.

Mr. Howard reached the interesting conclusion that California's interpretation of beneficial consumptive use as used in the Colorado River compact would be beneficial to the upper basin. He stated that such interpretation would increase the surplus water—water unapportioned by the Colorado River compact—which then would be available to supply the Mexican burden. In this way, he said the call on the upper basin to make up deficiencies in Mexican deliveries would be less frequent and the amounts required to be supplied would be less. In the process, however, the upper basin would be deprived of the

current use of a significant quantity of water which I recognize and concede, under California's interpretations, would fall in the category of surplus. California claims one-half of the surplus; Arizona has a water-delivery contract providing for use by her of one-half the surplus at least until 1963. Who finally gets the surplus on a permanent basis depends upon the results of negotiations by commissioners appointed by the Governors of the seven States of the Colorado River Basin some time after 1963. I am of the opinion the upper basin will be content to enjoy the use of the salvaged water under its interpretation of the compact and not permit the salvaged water under California's interpretation to fall into the category of surplus or unapportioned water.

California's witness, Mr. Raymond Matthew, apparently has the same conception of the compact meaning of "consumptive use" in the upper basin as has Colorado because he estimates consumptive use under the compact in terms of depletion at Lee Ferry. Mr. Matthew, on April 16, 1947, appeared before this same subcommittee in connection with hearings on S. 483, "Reduce the Area of the Gila Federal Reclamation Project." On page 198a of the typewritten transcript of the hearings appears a table submitted by Mr. Matthew. Mr. Matthew states that—

"It (the table) is headed, 'Estimated available water supply for consumptive use in the upper basin under provision of the Colorado River compact.' "

Mr. Matthew then states, page 199:

"The water supply in the upper basin is best indicated by the flow at Lee Ferry."

The table submitted by Mr. Matthew was based on a critical period such as 1931–40, inclusive. The first item in the table is estimated virgin flow at Lee Ferry, 12,200,000 acre-feet average annually. The second item in the table represents the minimum flow required at Lee Ferry by the compact—7,500,000 acre-feet. The third item is designated as available water supply for consumptive use for upper basin without withholding storage—4,700,000 acre-feet.

As Mr. Matthew suggested:

"Item 3 is simply the arithmetical difference between items 1 and 2 and constitutes the available water supply for consumptive use in the upper basin without hold-over storage."

In other words, he is interpreting depletion of the flood at Lee Ferry to be synonymous with the available water supply under the compact for beneficial consumptive use in the upper basin. If Mr. Matthew were to apply exactly the same kind of analysis to the Gila River Basin, he would conclude from the last column of table CXLIV on page 285 of the Colorado River report, March 1946, of the United States Department of Interior, that the average annual amount of water available in the Gila River Basin for beneficial consumptive use is 1,272,000 acre-feet, this being the natural (virgin) flow of the river at the mouth. From this quantity it would be necessary that he deduct whatever flow reaches the mouth due to inability of Arizona entirely to deplete the flow.

I now pass to the subject of water supply of the Colorado River Basin and the amount available for use by Arizona.

Mr. E. B. Debler, consulting engineer for the State of Arizona, submitted a statement on water supply to this committee on June 27, 1947. I concur in Mr. Debler's conclusions with respect to water supply because I collaborated with him in making the studies.

Mr. R. Matthew for California submitted to the committee his conclusions with respect to water supply and requirements of existing projects in the lower basin based on critical periods such as 1931–40 inclusive and 1930–46 inclusive. His conclusions are contained in table No. 1 which he submitted with his statement. While Mr. Matthew stated that his table is only of an engineering nature and is intended to show the estimated available water supply and the requirements of existing projects in the lower basin, nevertheless, it represents the results of the application of California's interpretation of the Colorado River compact and related documents.

The section of the table relating to Arizona projects has to do with requirements of existing (operating) and authorized projects. The section of the table having to do with California's requirements is labeled "California (as limited by existing contracts)." A similar section might have been placed in the table showing the Arizona requirements as limited by the existing water delivery contract between Arizona and the Secretary of the Interior. We believe that Mr. Matthew's table reflects California's legal theory as borne out by Mr. Howard's statement that the effect of his interpretation so far as available water is concerned would be presented by an engineer.

My major differences with Mr. Matthew is with respect to (1) his treatment of Gila River water, (2) his assumption that 200,000 acre-feet of excess delivery to Mexico will be required in order to fulfill the Mexican water treaty obligation, and (3) in the setting up in his table of California's requirements for projects which under California's system of priorities have junior priorities and are therefore on an infirm status so far as water supply is concerned.

Under item 3, Mr. Matthew sets up Gila River water and tributaries as an item of water supply in the amount of 2,300,000 acre-feet. He states that this represents the amount of water supply available for consumption on the Gila River and its tributaries. Contrary to this, he sets up item 9 as a requirement on this water supply in the amount of 2,270,000 acre-feet. He suggests that instead of setting up the 2,300,000 acre-feet, had he used as a water supply the virgin flow at the mouth that is available for depletion by Arizona, that a corresponding amount would have been set up for item 9, and the final result of the table would have been the same. This is true. But the form of the table is misleading. Item 14 implies a present use and requirement by existing authorized projects in Arizona of 3,500,000 acre-feet. Although he insists that the table has nothing to do with the interpretation of the compact or any related documents, and that it is merely an engineering table, nevertheless the above quantity of water could be interpreted to mean the consumptive use by Arizona as intended under the terms of the compact.

I again submit that what the compact commission had in mind with respect to the Gila River and with respect to the upper basin at Lee Ferry was that depletion at the mouth was synonymous with beneficial consumptive use as such term is used in the compact. This being the case, the 3,550,000 acre-feet should be reduced by over 1,000,000 acre-feet which represents natural losses on the Gila River under virgin conditions with which California is charging Arizona by its interpretation.

In passing, I call attention to the fact that if his theory were correct, Mr. Matthew's estimate of item No. 3 is wrong because he has used the long-time average and actually he is dealing with a period of low water supply. On this basis, this item should be less. However, he should have estimated consumptive use on the Gila, by taking the estimated virgin flow of the Gila minus the present flow of the Gila at the mouth.

Senator WATKINS. And the mouth is at this end of the Colorado.

Mr. TIPTON. Yes.

Senator WATKINS. It is theoretical because it does not actually dump any water in there now, does it?

Mr. TIPTON. Very little water comes in.

Senator WATKINS. What you are saying is more or less theoretical?

Mr. TIPTON. There is some. The estimated virgin flow of the river at the mouth, by the Bureau of Reclamation, is 1,272,000 acre-feet. That is a long-time mean. The estimated consumptive use on the Gila as made by the Bureau is 1,135,000 acre-feet. During the last 17 years there has been a drought. Prior to that there was a period of fairly good water supply which, if it recurred, might produce some flow out of the mouth of the Gila.

Shall I proceed?

Senator MILLIKIN. Yes.

Mr. TIPTON. Under item 5, Mr. Matthew assumes that it will be necessary to deliver to Mexico 1,700,000 acre-feet of water in order to insure Mexico's receiving 1,500,000 acre-feet in accordance with the scheduled delivery which she might set up. He states that this is necessary on account of the difficulty of measuring accurately the large quantity involved and of controlling precisely the rate of flow from points of release in the United States to the international boundary. He suggests that this point of release is Davis Dam. Mr. Matthew is wrong in assuming that the rates must be precisely controlled. Article 15, paragraph A of the treaty provides:

"The water allotted in subparagraph (a) of article 10 of this treaty shall be delivered to Mexico at the points of delivery specified in article 11, in accordance to the following two annual schedules of deliveries by months, which the Mexican section shall formulate and present to the Commission before the beginning of each calendar year."

It should be specifically noted that the schedules of delivery are by months and not by days. This is borne out again by paragraph F of article 15 which reads as follows:

"Subject to the limitations as to rates of delivery and total quantities set out in schedules I and II, Mexico shall have the right, upon 30 days' notice in advance to the United States section, to increase or decrease each monthly quantity prescribed by those schedules by not more than 20 percent of the monthly quantity."

Since the accounting is on a monthly delivery basis, overdeliveries and underdeliveries are averaged out over the monthly periods.

Item 9 of Mr. Matthew's table purporting to show the requirements of California's projects in the amount of 5,362,000 acre-feet is misleading and unfair to Arizona and other States. Again Mr. Matthew says that this is a mere showing of water requirement and has no relation to interpretation of the compact or any related documents. Since Arizona also has an existing contract, the amount of water covered by it could also have been set up in the table even though it is recognized that the contract cannot be filled in its full amount. Mr. Matthew did state that the amounts shown in items 15 to 18 of the table as well as the total shown as item 19 are exactly the same as the amounts covered by the various water delivery contracts held by California interests with the Secretary of the Interior. Mr. Matthew failed to mention California's statute of self-limitation and the system of priorities which she has set up to account for the 5,362,000 acre-feet and the fact that 962,000 acre-feet of the so-called requirements are covered by junior priorities which are on an unfirm status.

Before leaving the water supply question and going to the California situation, I would like to comment on a part of Mr. C. C. Elder's statement made before the committee on July 1. Mr. Elder discusses the probable return flow from the Central Arizona project and calls attention to the difference between the estimates made by Mr. Larson of the USBR and by Mr. E. B. Debler. He then concludes that none of the water from the Gila Valley released to take care of salt balance "will dependably reach the Colorado River or at such times as credit can be claimed under the terms of the Mexican Treaty". Mr. Elder then makes the following statement:

"It seems not unfair to recall that only 2 years ago, at the Senate's hearing on the Mexican Treaty, the burden of this treaty allocation on Lake Mead storage was testified to, by USBR and other Federal and State witnesses of distinction, as never to exceed 600,000 acre-feet annually, due to return flow and other related fallacies. In contrast, present USBR and Arizona statements, as well as 1946 and 1947 editions of the USBR Colorado Basin Comprehensive Report, all agree that this burden will be 1,500,000 acre-feet annually. Such sudden and unexplained variations of profound estimates and solemn, even if unsworn, testimony, should at least in some degree affect the weight now given to estimates, equally important and similarly unrelated to observable factual conditions."

Mr. Elder assumes that the Mexican burden on Lake Mead now is shown to be 1,500,000 acre-feet instead of the maximum of 600,000 acre-feet as testified to by witnesses in the hearings on the Mexican Water Treaty. It is inconceivable that an engineer of Mr. Elder's experience would knowingly make such a misleading statement. The USBR Colorado Basin Comprehensive Report as well as the testimony of both Arizona and California witnesses in this hearing dealt with the consumptive use of water when considering water requirements and the comparison of the aggregate of such requirements with the total available virgin water supply. No consideration was given to diversion requirements nor was consideration given to return flow as an element of water supply. Such was not necessary. Although the 1,500,000 acre-feet must come out of the original water supply of the basin because there is no other source, nevertheless, much of the 1,500,000 acre-feet can be and will be supplied by return flow from United States projects which now and will reach the stream too low to be used by gravity diversion in the United States. The testimony in this hearing together with the testimony in the hearing on S. 483 concerning he Gila Federal Reclamation Project indicates that the Mexican burden on water reaching Imperial Dam will not be greater than 600,000 acre-feet per annum.

I wish to call attention to Mr. G. W. Lineweaver's statement referring to the Gila project. He testified as to the total diversions to the various units of the project and the return flow that could be expected to reach the river from those units. His testimony is summarized in a table which I am submitting for the record, which is taken from page 70 of the hearings before the Committee on Irrigation and Reclamation on H. R. 5434, House of Representatives, Seventy-ninth Congress, second session.

(Table 2 above described follows:)

TABLE 2.—*Estimated diversion of water at Imperial Dam return flow and consumptive use in acre-feet—Gila project, Arizona*

Diversion	Area (acres)	Diversion at dam		Estimated return flow		Consumptive use	
		Per acre	Total	Per acre	Total	Per acre	Total
Yuma Mesa	51,000	11.0	561,000	7.0	357,000	4.0	204,000
Wellton-Mohawk	75,000	9.2	690,000	5.2	390,000	4.0	300,000
North and South Gila Valleys	15,000	6.0	90,000	2.0	30,000	4.0	60,000
Total	141,000		1,341,000		[1] 420,000		564,000

[1] Does not include return flow from Yuma Mesa as return flow within the United States from that area is not assured.

It may be noted that he estimates that there will return from the Wellton-Mohawk area 390,000 acre-feet, and from the North and South Gila 30,000 acre-feet. He also testified that the return from the Yuma-Mesa unit would be 357,000 acre-feet but he stated that there is some question whether this return would reach the river before it crossed the boundary into Mexico. S. 483, as reported out by the Senate subcommittee, has the effect of limiting consumptive uses by the Yuma-Mesa and North and South Gila to a total of 300,000 acre-feet per annum and likewise consumptive use by the Wellton-Mohawk unit to 300,000 acre-feet, making a total of 600,000 acre-feet. Assuming that none of the Yuma-Mesa returns do reach the stream in the United States, the following totals can be expected to reach the river below Imperial Dam and be available to satisfy deliveries to Mexico:

Source:	*Return acre-feet*
Gila project	420,000
Yuma project	190,000
Central Arizona project	225,000
Desilting water	100,000
Total	935,000

The burden on the water supply from above Imperial Dam to take care of Mexican delivery in its full amount on the above basis, therefore, would be 565,000 acre-feet. The Mexican delivery will be curtailed during a long drought period which existed for the period covered by Mr. Debler's study. If it is curtailed to the extent assumed by him and by me, the burden on the water above Imperial Dam to satisfy the Mexican delivery would be 433,000 acre-feet. It is reasonable to assume that ultimately the Yuma-Mesa unit of the Gila project will develop to the extent that it will consume 300,000 acre-feet less that which is being consumed by the North and South Gila units. It is assumed the acreage will be increased to the maximum extent possible even though to do this may require the construction of major drainage canals to insure that the return flow from the unit reaches the river in the United States.

The provisions in the Senate bill will further such procedure because any water that returns to the stream below the boundary will be classed as consumptive use, so it will be to the benefit of Arizona to construct drainage canals to insure that returns reach to the river above the boundary.

If this is done, an additional 357,000 acre-feet (Mr. Lineweaver's estimate) will return to the river below Imperial Dam and above the international boundary. This will reduce the burden on the water above Imperial Dam to satisfy normal Mexican deliveries to about 300,000 acre-feet. Under this condition 375,000 acre-feet would have to be delivered to Mexico past Imperial Dam on account of the treaty provisions, which makes that the minimum delivery through the All-American Canal.

If, during a protracted drought period such as envisioned in Mr. Debler's study, the Mexican deliveries were curtailed to the extent estimated by him, very little water would be required to pass Imperial Dam to satisfy the Mexican burden. It would be limited to the minimum amount required to be delivered to Mexico through the All-American Canal.

The amount of return flow might be increased somewhat beyond that indicated above by seepage losses from the All-American Canal when increased amounts of water are carried by it.

Finally, with respect to the water supply available to Arizona for use by its central Arizona project during a critical water period. I am in agreement with Mr. Debler that the full consumptive use requirement of something over 1,000,000 acre-feet would be available.

I shall now pass on to the California situation.

Prior to the ratification of the Colorado River compact by the various States other than California, California was required to limit by statute the use of waters allocated under article III (a) of the Colorado River compact to 4,400,000 acre-feet per year and not over one-half of the surplus water not apportioned by the compact. California passed this self-limiting statute. A copy of the statute has been introduced in the record of these hearings and the committee is familiar with its terms.

California then set up a system of priorities covering the use of 4,400,000 acre-feet of article III (a) water and 962,000 acre-feet of unapportioned surplus water. The priorities as set up by California are given in the table which I present herewith. The table also indicates the estimated present use under each priority.

(The table submitted by Mr. Tipton follows:)

Priority No.	Description	Acre-feet	Total	Estimated present use under each priority (1945)
1	Palo Verde irrigation district, 104,500 acres			
2	Yuma project, 25,000 acres			
3	(a) Imperial irrigation district and lands under All-American Canal in Imperial and Coachella Valleys. (b) Palo Verde irrigation district in lower Palo Verde mesa, 16,000 acres			
	Total for 1, 2, 3	3,850,000		2,794,000
4	Metropolitan water district of Southern California and city of Los Angeles	550,000		66,000
	Total from III (a) water		4,400,000	2,860,000
5	(a) Metropolitan water district of Southern California and the city of Los Angeles	550,000		
	(b) City and county of San Diego	112,000		
6	(a) Imperial irrigation district and lands under the All-American canal in the Imperial and Coachella Valleys. (b) Palo Verde irrigation district in lower Palo Verde mesa, 16,000 acres			
	Total for 6 (a) and (b)	300,000		
	Total from surplus		962,000	None
	Total of all priorities		5,362,000	2,860,000

Mr. TIPTON. Attention is called to the fact that the total priorities are 5,362,000 acre-feet and that the use of water under the priorities during the year 1945 was 2,735,000 acre-feet. I do not have the 1946 values. No water was used under the junior priorities.

California interests then negotiated contracts with the Secretary of the Interior for the delivery of water from Lake Mead to satisfy the several priorities.

The contracts for the delivery of water from Lake Mead are all made "subject to the availability thereof for use in California under the Colorado River Compact and the Boulder Canyon Project Act."

The contracts provide, further:

"The United States shall not be obligated to deliver water to the district when for any reason such delivery would interfere with the use of Boulder Canyon Dam and reservoir for river regulations, improvement of navigation, flood control, and of states or private perfected rights in or to the waters of the Colorado River or its tributaries in pursuance of Article III of the Colorado River Compact; and this contract is made for the express condition and with the express covenant that the right of the district to the waters of the Colorado

River of its tributaries is subject to and controlled by the Colorado River Compact."

Attention is called to subsection (f) of article III of the Colorado River compact. This subsection provides that further equitable apportionment of the beneficial uses of the water of the Colorado River system unapportioned by paragraphs (a), (b), and (c) may be made after October 1, 1963, if and when either basin shall have reached its total beneficial consumptive use as provided in paragraphs (a) and (b) of article III of the compact. Therefore, until the upper basin is consuming its total allocation of 7,500,000 acre-feet or until the lower basin is consuming its total allocation of 8,500,000 acre-feet, no State in either basin can acquire any title to surplus, and it should be noted that any surplus apportioned in the future under subsection (f) must be from surplus after any treaty obligations are satisfied.

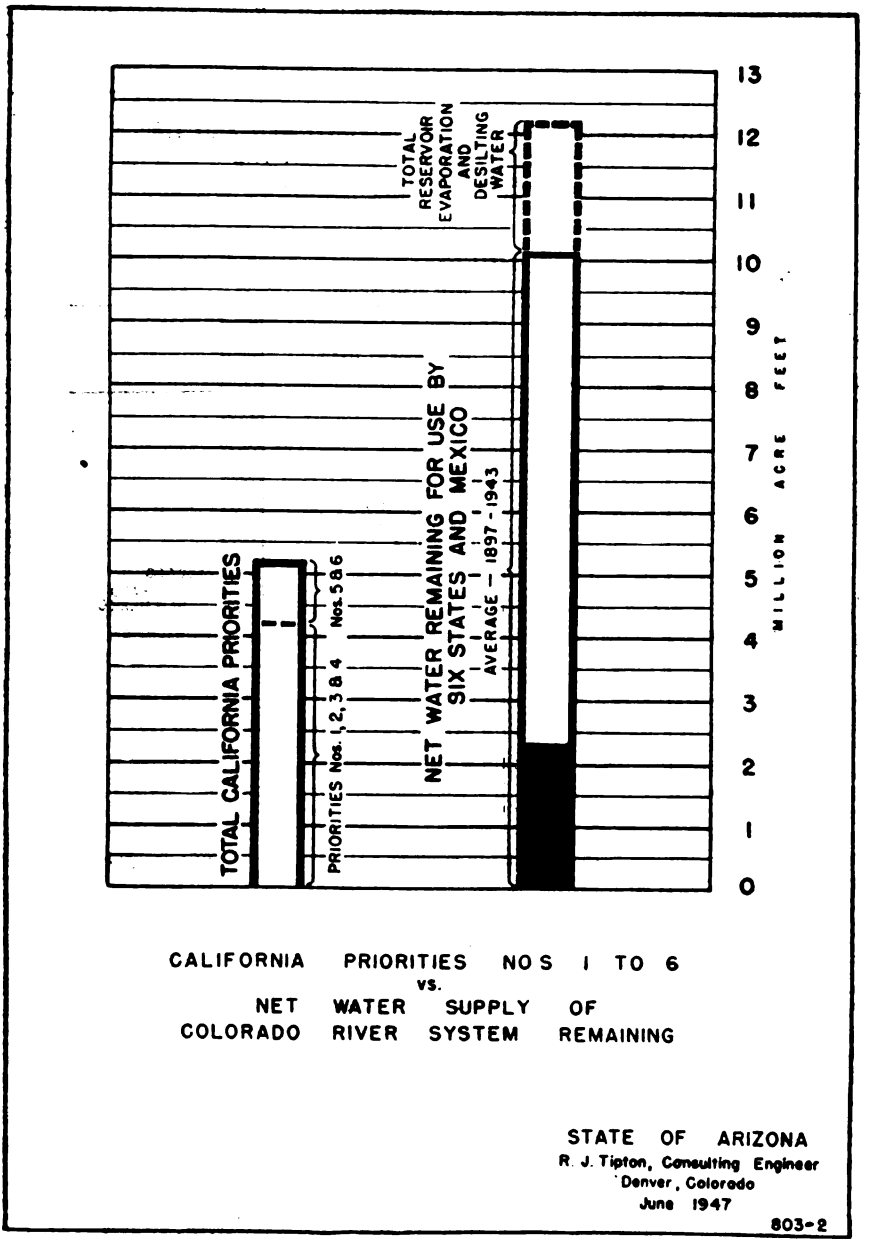
It is apparent, therefore, that the contracts held by California for the delivery of 962,000 acre-feet of surplus water are not firm contracts and are contingent upon what further apportionment might be made of waters of the Colorado River system after October 1, 1963. The water available for delivery under those contracts would not only be contingent upon the apportionment that might be made of the surplus after 1963, but it would appear that the availability of water might also be contingent upon agreement between the lower basin States as to the division of that part of the surplus apportioned to the lower basin after 1963. The status of the various California priorities in relation to the apportionment of water, as made by the Colorado River compact and as visualized by the Boulder Canyon Project Act, is shown graphically on drawing No. 803–2. The drawing is self-explanatory.

The bars below the first (lower) horizontal line on the drawing represent the water apportioned by article III (a) and (b) of the Colorado River compact. The left-hand bar represents the total apportionment of 8,500,000 acre-feet to the lower basin. It is divided into two parts. The upper part represents the 4,400,000 acre-feet of article III (a) water to which California by statute has limited herself. The lower part of the bar represents 4,100,000 acre-feet for Arizona, Nevada, Utah, and New Mexico. The 4,100,000 acre-feet is that which remains for those States out of the total water apportioned to the lower basin after taking out of it the amount to which California has limited herself. The right-hand bar on the graph represents the total allocation of 7,500,000 acre-feet to the upper basin. Above the first horizontal line is the water apportioned by article III (c). It represents the 1,500,000 acre-feet that has been allotted to Mexico by treaty. Above the second (upper)) horizontal line appears a zone to represent surplus water to be apportioned in accordance with article III (f) and (g) of the compact. It is in this category that the 962,000-acre feet represented by the junior priorities of California are found. The bar extending above the second horizontal line represents the 962,000 acre-feet.

Mr. Debler's analysis checked by me indicates that during periods as long as 17 years or possibly up to 20 years there will be no water in the river to satisfy any such priorities. These priorities are not only unfirm due to the provisions of the compact and Boulder Canyon Project Act but ther are unfirm from the standpoint of water supply itself. The water-delivery contracts provide for delivery of water from Lake Mead. During a protracted period of drought such as the one which commenced in 1930 and has not yet ended, under full development in the basin, there would be no surplus water in the meaning of the Colorado River compact to satisfy such junior priorities.

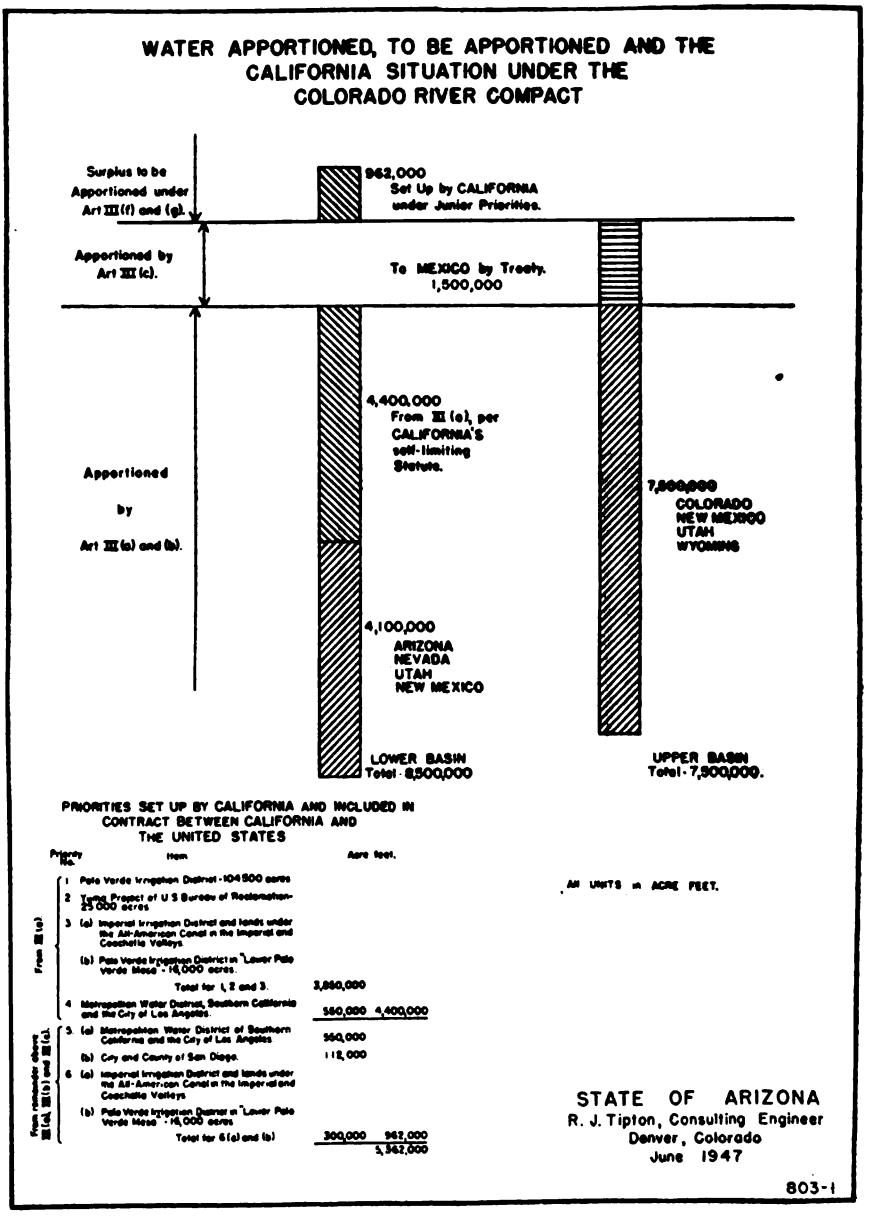
California has been making continuing efforts by various means to provide a firm water supply to satisfy such priorities. At the moment, by the interpretation of the Colorado River compact and related documents, she is attempting to carve out a water supply for such priorities from a water supply which, in my opinion, should go to Arizona and to the upper basin States under the compact. Her interpretation of the meaning of III (b) water probably would provide some 500,000 acre-feet for the junior priorities. Her interpretation of beneficial consumptive use would provide a substantial amount from Arizona and the upper basin water supplies.

The following describes the situation as it would be if California were successful in her attempts. The total average annual virgin-water supply of the Colorado River Basin as estimated by the United States Bureau of Reclamation is 17,720,000 acre-feet. The Bureau's estimate of main-stream-reservoir losses is 1,701,000 acre-feet. Other reservoir losses together with desilting water probably would bring man-made losses close to 2,000,000 acre-feet. There would therefore remain a virgin supply of 15,720,000 acre-feet for net use.



By California's interpretation, she claims that she has a right to the use of 5,362,000 acre-feet from this net supply. There would remain for net use by the other six Colorado River Basin States and Mexico 10,358,000 acre-feet. California's supply would be more than one-half of that remaining for the six States and Mexico. In other words, the only State in the basin which produces no water is attempting to gain the right to use 35 percent of the total net available supply as against the compact and contract rights of the six remaining States and the Republic of Mexico. California by her interpretation would leave to

Arizona out of the water supply indicated above only about 2,300,000 acre-feet which is slightly over 14 percent of the total net water supply. Drawing No. 803-1 shows graphically the above situation.



The left-hand bar on the drawing indicates the total of the California priorities in terms of net water consumption. The bar on the right indicates graphically the remaining total water supply. The top portion of the bar outlined by a dotted line represents total reservoir evaporation and desilting water. The balance of the bar outlined by a solid line represents the net water that would

remain for use by the other six States of the Colorado River Basin and Mexico. The amount of water that would remain for use by Arizona under California's theory is shown as the black portion of the right-hand bar.

That finishes my statement, Mr. Chairman.

Senator MILLIKIN. Any questions?

Senator MCFARLAND. No questions.

Senator MILLIKIN. Thank you, Mr. Tipton.

Senator MCFARLAND. Mr. Chairman, we have one or two additional witnesses. We will abide by the wishes of the Chairman; I would like to have one of them testify if agreeable. His testimony will consume about 10 minutes. I do not wish to burden the Chairman and the members of the committee unduly.

(Appendix A. Excerpts from minutes of seventeenth meeting of Colorado River Compact Commission, R. J. Tipton:)

APPENDIX A

MINUTES OF THE SEVENTEENTH AND EIGHTEENTH MEETINGS OF THE COLORADO RIVER COMMISSION HELD IN SANTA FE, N. MEX., ON THE 15TH AND 16TH OF NOVEMBER 1922

Mr. HOOVER. My mind is a little mixed. In the first place, on page 5, Senate Document 142, are given the gagings at Laguna Dam, which do not include the Gila flow. Mr. Carpenter's calculation is based on the gagings at Yuma, which I understand include the Gila, and that is the difference between M. Carpenter's basis and the basis of the Laguna gagings. Is that not true?

Mr. CARPENTER. No; partly correct. I didn't deduct the loss in the river from Lee Ferry to Laguna.

Mr. HOOVER. I was saying the difference between your calculations and the Laguna gagings is simply the flow of the Gila. The Laguna gagings do include water which goes into the Imperial Valley.

Mr. CARPENTER. Yes, sir.

Mr. HOOVER. So that if we take the Laguna gagings instead of the Yuma gagings, we will exclude the Gila flow.

Mr. A. P. DAVIS. We exclude the Gila flow, but we include the diversion for the Yuma project. The measurements at Yuma, on the other hand, do not include water diverted for the Yuma project, but include the Gila. When you measure at Yuma you are measuring above the Imperial diversion and below the Laguna Dam diversion.

Mr. HOOVER. The Laguna Dam gagings include water which goes to the Yuma project?

Mr. A. P. DAVIS. They do.

Mr. HOOVER. So they include the whole flow of the Colorado River at that point?

Mr. A. P. DAVIS. At that point; yes, sir. That is what they are intended to include, the whole flow there, which is above the Gila and, of course, excludes that.

Mr. HOOVER. Then the problem also goes into the consumptive use in the upper basin. In order to reconstruct the river, the consumptive use in the upper basin must be taken into account. Is it true that the Laguna gagings include the Imperial Valley?

Mr. A. P. DAVIS. Yes.

Mr. HOOVER. The Imperial Valley diverts below.

Mr. A. P. DAVIS. Yes.

Mr. HOOVER. Consequently, at Laguna you have the whole flow of the Colorado River at that point?

Mr. A. P. DAVIS. Yes.

Mr. HOOVER. Without deductions, except the Gila.

Mr. A. P. DAVIS. Yes.

Mr. HOOVER. And if you were to reconstruct the river, you must also take account of the consumptive use of the upper basin and add that to the Laguna gagings, and ought to add also the Gila flow. Have you a rough idea as to what the flow of the Gila would be if it had not been used for irrigation, or what the consumptive use, plus the present flow, is?

Mr. A. P. DAVIS. I can estimate that fairly closely. The mean annual flow as measured during the last 20 years is 1,070,000 acre-feet. The areas that are irrigated there are given in this document, 142, and we can apply a duty of con-

sumptive use of water on that area and approximate fairly well, I believe, the consumptive use in the Gila Basin, if that is what is wanted.

Mr. HOOVER. My only point on that is, does it approximate, possibly, the amount of consumptive use in the upper basin?

Mr. A. P. DAVIS. Oh, no; it is smaller. The consumptive use in the upper basin is on that table I gave you.

Mr. HOOVER. About 2,400,000?

Mr. A. P. DAVIS. In 1920 the consumptive use was about 2,400,000 acre-feet.

Mr. CARPENTER. That is a progressive increase from 0 up?

Mr. A. P. DAVIS. Yes.

Mr. CARPENTER. You would think the Gila consumptive use would be something over a million and a half feet?

Mr. A. P. DAVIS. Very likely less than a million and a half. But I am not sure about that till I figure on it a little.

Mr. CARPENTER. In other words, there might be——

Mr. A. P. DAVIS (interrupting). There would be a good deal less.

Mr. CARPENTER. There might be, then, a million feet to go into this calculation for translating back from Laguna gagings?

Mr. A. P. DAVIS. To include the Gila; yes. It doesn't seem like it would apply to the Little Colorado, as its contribution is offset by evaporation. There is very little outside the Gila Basin that is not thus offset.

Mr. CALDWELL. Mr. Davis, just where is the Gila measured?

Mr. A. P. DAVIS. There have been different points; one was at Dome.

Mr. CALDWELL. Tell me where it is with respect to the mouth?

Mr. A. P. DAVIS. Dome is about 12 miles above the mouth, and that was changed on account of difficulties of measurement, but not very materially.

Mr. CALDWELL. This 1,070,000 you speak of is an average flow, is it?

Mr. A. P. DAVIS. Yes.

Mr. CALDWELL. Average annual flow over how many years?

Mr. A. P. DAVIS. Eighteen years, I believe. It is all published in Senate Document 142.

Mr. CALDWELL. That is near enough.

Mr. HOOVER. On the table on page 5, Senate Document 142, take 1920 for instance, you have 21,000,000. That is the Laguna flow.

Mr. A. P. DAVIS. Yes.

Mr. HOOVER. What would be added here, as a rough guess, would be the flow and consumptive use of the Gila and Little Colorado and the consumptive use of the Colorado below Lees Ferry and above Laguna. This all comes to about a million and a half, and the consumptive use in the upper basin is 2,400,000 so it would be a credit of water to the Laguna readings of approximately a million feet, something like that.

Mr. CARPENTER. Yes. If there are others, like the Virgin and other rivers, that would be still more of a reduction.

Mr. SCRUGHAM. I thought the Imperial Valley had a heading somewhere at Laguna. What was all the disturbance by the Yuma people?

Mr. A. P. DAVIS. They have contracted for building their canal and heading it at Laguna and have agreed to do that, but never have done it. They have never taken any water out above the Yuma project. The best use of the Gila, as I said yesterday, is in its own valley and that probably will be accomplished some day.

Mr. HOOVER. Would it be possible for you to recast some figures in the light of the counteraction of deducting the Gila flow and consumption from the upper basin flow and consumption?

Mr. A. P. DAVIS. The lower basin consumptive use you mean, don't you? Make some approximation of a difference in consumptive use between the lower basin and the upper basin, exclusive of the Imperial Valley, and add that to these figures.

Mr. HOOVER. You would have to add to the consumptive use the flow of the Gila over and above its consumptive use.

Mr. A. P. DAVIS. Did you want the flow of the Gila included also?

Mr. HOOVER. It is a part of the drainage basin.

Mr. CARPENTER. You are now revolving as I revolved at one time and I decided consumptive uses had better offset one another and took the figures as printed.

Mr. A. P. DAVIS. I don't know how near they would do that. You don't mean to undertake to run that back over 20 years—take it as it is now; is that what you mean?

Mr. CALDWELL. Run it back over 20 years.

Mr. A. P. DAVIS. If given time I could make an estimate that would be worth something. The present consumptive use we practically know. How that has grown is a matter of history.

Mr. HOOVER. I might phrase it in another way perhaps. On page 5 of Senate Document 142 your mean flow at Laguna is 16,400,000. Now if you went into this elaborate calculation to account for the Gila consumptive use below and consumptive use about it might add a certain amount to that mean flow—it might add between 500,000 and a million feet. That is just a guess that might be the result of such an elaborate calculation.

Mr. A. P. DAVIS. That is true.

Mr. HOOVER. And if you took the low years as being 500,000 less than that, it probably wouldn't vary materially or affect the mean?

Mr. A. P. DAVIS. No.

Mr. HOOVER. So that you would get somewhere around 17,000,000 feet as the Lee Ferry flow?

Mr. A. P. DAVIS. Yes; 17,000,000 would be a correction in the right direction, probably not very far wrong.

Mr. HOOVER. I should think for matters of discussion we could take it that the reconstructed mean at Lee Ferry is a minimum of 16,400,000 and perhaps with this elaborate calculation, half a million above; i. e., 17,000,000. Therefore, we would come to a discussion of a 50–50 basis on some figure lying between 16,400,000 and 17,000,000.

Mr. S. B. DAVIS. With all due respect to these eminent gentlemen, I am still from Missouri; I have to be shown, but I am willing to enter into a discussion on that line.

Mr. HOOVER. I should think the result of the deliberations and of our advice on that matter have been to establish the 16,000,000 as a sort of least mean.

Mr. S. B. DAVIS. As the average mean at Lee Ferry.

Mr. HOOVER. Yes; and that an apportionment of a minimum would be half that sum—8,200,000 acre-feet instead of the 6,260,000 acre-feet, as suggested by Mr. Carpenter—so that this would be the question of your proposals—delivering approximately 82,000,000 acre-feet on 10-year blocks.

Mr. NORVIEL. As the minimum average.

Mr. HOOVER. That's the total they agree to deliver in 10-year blocks. Then, just to further the discussion, if the Mexican deduction is to be borne by both sides, and we take the maximum Mexican position, it would mean, so far as the southern basis is concerned, their needs, as worked out by the Reclamation Service, including the projects in view, are 7,450,000 feet, so that 8,200,000 covers that with a comfortable margin.

Mr. A. P. DAVIS. It includes half the water to be delivered to Mexico on the basis of 800,000 acres.

Mr. HOOVER. So the southern basin would be protected as to their end and still have a margin of about 800,000 acre-feet.

Mr. NORVIEL. That would be for possible future development.

Mr. HOOVER. Or anything that may happen to you.

Mr. NORVIEL. Delivered at the point of delivery.

Mr. CARPENTER. Delivered at Lees Ferry; you may already have figured your evaporation on the river.

Mr. NORVIEL. Not this one. We figured that for the purpose of calculation.

Mr. CARPENTER. You told us that power was many times more valuable than any other use. We are letting you tear all the fire out of that water clear down to Laguna.

Mr. NORVIEL. You have more miles above and the fire will already have been torn out.

Mr. CARPENTER. It recovers itself; it's just as good; our evaporation is already taken out.

Mr. NORVIEL. The evaporation is not taken out of the 2,000,000 if it is to be delivered to us.

Mr. CARPENTER. If we use it for power above, our evaporation is already out.

Mr. NORVIEL. The evaporation has not been deducted from the million and a half acre-feet that you are going to deliver in Mexico. You have to make delivery at the point of delivery, not 600 miles above.

Mr. HOOVER. Mr. Norviel, you have a margin of 750,000 feet to take care of all needs all along. That's pretty liberal.

Mr. NORVIEL. That makes 8,200,000 acre-feet-a-year minimum.

Mr. HOOVER. That's the total to be delivered at Lees Ferry.

(Mr. Norviel requests time for consultation.)

Mr. NORVIEL (after recess). As I understand the proposition, Mr. Chairman, it is to divide the water so that the lower basin will receive—including the one-half to be furnished the Mexican lands—82,000,000 acre-feet per annum over a period of 10 years average, with 4,500,000 acre-feet minimum annual flow.

Mr. HOOVER. It might be worth discussion. I wouldn't want to put it in the mouth of the gentlemen from the North that it is their proposition.

Mr. CALDWELL. There is no proposition; there is recorded a "no" vote against that minimum yet.

Mr. CARPENTER. That's a subject of discussion.

Mr. NORVIEL. I thought when we retired we were to consider that on the basis of 4,500,000 acre-feet minimum annual flow.

Mr. CARPENTER. From the last poll of the vote on the minimum there were five for and two against, but the period was left undecided.

Mr. NORVIEL. Now we are fixing the period at the greatest number of years suggested, which is 10.

Mr. CARPENTER. We thought the period was left open. The minimum is for 1 year, an irreducible minimum predicated on no period. The low year goes regardless of period.

Mr. HOOVER. Supposing I take the onus of a suggestion for the consideration of the upper States—the 82 million 10-year block and a minimum flow for 1 year of 4½ million.

Mr. CARPENTER. If you crowd us on the minimum we will have to have a protecting clause on precipitation, because we can't control that. Nature will force us into a violation, any possibility of which we should strenuously avoid in our compact, because that would provoke turmoil and strife. The mere matter of 500,000 acre-feet as the minimum is small, but it might be decisive at such a time. It is not with the idea of trying to avoid delivering the water that I am suggesting the low figure, it is to avoid that which would result from nature's forcing a minimum that we could not control; therefore, we want to avoid that as nearly as we can.

Mr. HOOVER. You are seeking protection from a shortage on precipitation beyond that heretofore known. (Colorado River Commission minutes of the sixteenth meeting, Bishop's Lodge, Sante Fe, pp. 19–29, Tuesday, 3 p. m, November 14, 1922.)

Mr. S. B. Davis: Mr. Norviel, in order that we may know how far apart we are in this matter—offer of 65,000,000 acre-feet in a 10-year period—would you state what you do consider a fair amount to be guaranteed to you at Lees Ferry?

Mr. NORVIEL. I think, inasmuch as your needs are practically even, we will accept the burden of the losses below Lees Ferry, and take a reconstructed river on an even basis at Lees Ferry. * * *

Mr. NORVIEL. I will go back to the proposition made to us yesterday. We will accept 8,200,000 acre-feet, on a 10-year basis with a 4,500,000 minimum, while on a 5-year basis a 4,000,000 minimum flow will be acceptable. * * *

Mr. CARPENTER. That is, for any 5-year period there is to be a minimum of 4,000,000 acre-feet per year?

Mr. NORVIEL. Yes. * * *

Mr. HOOVER. What Mr. Norviel means is for any 1 year the minimum shall not be less than 4,000,000 for a 5-year period, or less than four and a half a year for a 10-year period.

Mr. S. B. DAVIS. The difficulty with 82,000,000, as I have said, is that we have already experienced 10 years in which it would have been impossible for us to comply.

Mr. HOOVER. The difficulty is in guaranteeing in the face of an unknown quantity?

Mr. S. B. DAVIS. Yes, sir (Colorado River Commission, minutes of the seventeenth meeting, Bishop's Lodge, Santa Fe, pp. 12, 13, 14, Wednesday, 11 a. m., November 15, 1922.)

Mr. NORVIEL. Before we recess, perhaps, I might state another little proposition and let them give it consideration if they care to.

The State of Arizona proposes to allocate the waters of the Colorado River between the proposed upper and lower divisions upon a 50–50 division as follows:

The river is to be reconstructed annually by measuring the flow at or near Lee Ferry in Arizona and by adding thereto the consumptive use of water in the upper basin, the total amount of water thus found to be the basis for an equal division between the two divisions, each division contributing equally to the amount that may hereafter be allotted to Mexico by international agreement

or otherwise. In the event that the upper division should in any year exceed its percentage and thus deprive the lower division of its percentage the deficiency shall be compensated for during the next two succeeding years. * * *

Mr. CALDWELL. Just how would you determine the consumptive use in the upper basin?

Mr. NORVIEL. It is to be determined each year.

Mr. CALDWELL. Just a minute. Would you predetermine the consumptive use in acre-feet, or would you use the actual consumptive use?

Mr. NORVIEL. It would have to be measured.

Mr. CALDWELL. It would be very difficult, impossible practically.

Mr. NORVIEL. I think I said so in the beginning of our meetings.

Mr. CALDWELL. I think it would be impossible.

Mr. NORVIEL. Practically.

Mr. HOOVER. We will recess until 3 o'clock this afternoon.

Thereupon the meeting adjourned to meet again at 3 p. m., November 15.

CLARENCE C. STETSON,
Executive Secretary.

(Colorado River Commission, minutes of the seventeenth meeting, Bishop's Lodge, Santa Fe, pp. 24–25, November 15, 1922.)

(NOTE.—The caucus contained the afternoon and evening of November 15, the commission resuming executive sessions Thursday, November 16, at 10 a. m.)

Mr. HOOVER. * * * During the term of this compact the States in the upper division shall not deplete the flow of the river (at the point of division) below 75,000,000 acre-feet for any 10-year period, or below a flow of 4,000,000 acre-feet in any 1 year. Provided, however, that the lower division may not require delivery of water unless it can reasonably be applied to beneficial agricultural and domestic uses; and the upper division shall not withhold any water which may not be applied within such divisions to beneficial agricultural and domestic use. * * *

Mr. NORVIEL. Mr. Chairman, I can't get away from the idea that the figures are too low. While there is in it an element of a guaranty it is lower than the lowest 10-year period we have any knowledge of and it is also after the division is made—after the whole use in the upper division is taken out and would include the total use in the lower division. In other words, it is the excess over and above what the upper States have not heretofore used. It is less than half of the lowest 10-year period that has ever existed.

Mr. CARPENTER. That we have any record of.

Mr. NORVIEL. Yes; and I rather think that former years, if they had been measured, would have shown perhaps a worse condition, so I can't think that that is a fair division over a 10-year period, nor one which gives the fullest protection.

Mr. HOOVER. In our discussions yesterday we got away from the point of view of a 50–50 division of the water. We set up an entirely new hypothesis. That was that we make, in effect, a preliminary division pending the revision of this compact. The seven and a half million annual flow of rights are credited to the south, and seven and a half million will be credited to the north, and at some future day a revision of the distribution of the remaining water will be made or determined.

An increasing amount of water to one division will carry automatically an increase in the rights of the other basin and therefore it seemed to me that we had met the situation. This is a different conception from the 50–50 division we were considering in our prior discussions.

Mr. NORVIEL. If this includes reconstruction of the river, then, I concede it is a more nearly fair basis. But if it does not—if it is a division of the water to be measured at the point of demarcation, I still insist that it is not quite fair, because it is simply dividing what remains in the river.

Mr. HOOVER. We are leaving the whole remaining flow of the basin for future determination.

Mr. NORVIEL. What I am getting at is this: That the upper basin takes out and uses a certain amount of water, and as this reads, it proposes to divide the rest of it, 7,500,000 acre-feet per annum.

Mr. HOOVER. No.

Governor CAMPBELL. That is inclusive, Mr. Norviel.

Mr. NORVIEL. It reconstructs the river?

Governor CAMPBELL. Yes; in effect, as I understand it.

Mr. NORVIEL. Well, if it does that, then my objection will be removed.

Mr. HOOVER. Any other comment? If not all those in favor of this clause 7 as read please say "Aye."

(Thereupon a vote having been taken upon the paragraph numbered 7, the same was unanimously passed. (Colorado River Commission, minutes of the eighteenth meeting, Bishop's Lodge, Santa Fe, pp. 30-33. Thursday, 10 a. m., November 16, 1922.))

Mr. MURDOCK. I should also like to ask permission to have inserted in the record the testimony of Charles A. Carson, special attorney for the State of Arizona on Colorado River matters, printed in the hearings on H. R. 5434, Seventy-ninth Congress, second session (pp. 367–445 and pp. 517–533); also the brief of the Colorado River Basin States Committee which appears in the hearings on House Joint Resolution 225 et al., Colorado River water rights, Eightieth Congress, second session (pp. 265–296). Without objection, these will be inserted in the record at this point.

There was no objection.

(The matters referred to are as follows:)

STATEMENT OF CHARLES A. CARSON, SPECIAL ATTORNEY, STATE OF ARIZONA, ON COLORADO RIVER MATTERS, PHOENIX, ARIZ.

Mr. CARSON. Yes, Mr. Chairman. My name is Charles A. Carson, of Phoenix, Ariz., appearing here on behalf of the State of Arizona as special attorney for the State of Arizona in connection with Colorado River matters, under an act of the Arizona Legislature, which authorized the Governor to appoint attorneys and engineers.

There has been so much said here on the question and so many questions interjected here that I would like, if I can, to make a kind of a general geographical and historical statement without interruption in order to get it clear in this record as to Arizona's view on these matters.

Chairman MURDOCK. The witness may proceed to make a connected statement without interruption. Of course, there will be questions later.

Mr. CARSON. Yes; as soon as I am through.

Mr. WHITE. That was apparently for the ranking member on the Democratic side, was it not, Mr. Chairman?

Chairman MURDOCK. The matter about asking questions, well, no, not altogether.

Mr. CARSON. I wanted to call your attention to the map on the wall there of the Colorado River Basin.

This map on the wall represents by this outline the natural drainage basin of the Colorado River system, with the one exception that down here on the California side of the river it also tabes in an area which comprises the Imperial irrigation district, the Coachella Valley, the Metropolitan water district area, and the county of San Diego. That is not a natural part of the Colorado River Basin. The basin line at that point is indicated with this dotted line [indicating on map]. This map [indicating] does not show the areas in the upper basin outside of the natural drainage area of the basin from which water may be utilized.

The definition of the Colorado River compact takes into account not only the natural drainage basin but also areas upon which water from the basin might be utilized, and in that connection it is interesting to note that the natural drainage basin comprises some 240,000 square miles, of which Arizona contains 103,000 square miles; California, 4,000 square miles; Nevada, 12,000 square miles; Utah, 40,000 square miles; New Mexico, 23,000 square miles; Colorado, 39,000 square miles; and Wyoming, 19,000 square miles.

This history of the controversies concerning the Colorado River is not particularly important for the consideration of this bill, it seems to me, with some notable exceptions.

The first development, aside from a small development in the Palo Verde area was at Blythe, and the Yuma project, both in California and in Arizona was begun about 1895 by some California financiers who owned land in the Imperial Valley of California and in the Mexicali Valley of Old Mexico, and at that time they initiated the right to divert water through the old Alamo Canal through

Mexico for the use of the Imperial Valley and also for the use of the Mexican land.

That contract provided that, of the water flowing through that canal, Mexico should be entitled to one-half.

The plan involved in the filing of water rights and in the operation contemplated a canal of 10,000 cubic feet per second capacity, which, if it ran all year, would be some 7,000,000 acre-feet of water, of which Mexico would be entitled to one-half.

Then coming on down, the material thing, it seems to me, to this issue is this: Remember at that time, if you please, that Arizona was a territory. In the early stages of this Arizona had not acquired the status of statehood and did not acquire that status until 1912 when the Constitution of Arizona was adopted in accordance with the enabling act of Congress passed in 1910.

In that enabling act there is a significant provision, the United States required that Arizona by its constitution agree that the United States withdraw from entry and reserve all of the power dam sites on the Colorado River across the State of Arizona with the right to withdraw and reserve the lands bordering that stream across the State of Arizona, which Arizona did by the adoption of its constitution. So that Arizona has never had the ordinary rights enjoyed by the other basin States to control or to build or operate dams and diversion works from the Colorado River.

It has always been my thought that those provisions were inserted there for the protection of the development of the Imperial Valley and the Mexican lands then owned by California financiers.

Mr. Harry Chandler, of the Los Angeles Times, testified in 1924 before this committee that at that time he and his associates owned 833,000 acres of land in Mexico immediately below the border, of which some 600,000 acres were irrigable from the water of the Colorado River.

Now, keep that in mind, if you please. The canal right gave them the right, assuming continuous flow, to the use of 3,500,000 acre-feet in Mexico. This 600,000 acres of land had a diversion right, assuming 5 acre-feet per acre, which would make 3,000,000 acre-fet of water of the Colorado River going to Mexico, and the restrictions placed upon Arizona at the time of its admittance as a State and in the constitution assured those people, I assume, or, at least, they thought it did, that Arizona could not divert water from the main stream of the Colorado River without the consent of Congress.

Well, Arizona became a State in 1912.

The next point I want to go to is the Colorado River compact that was signed at Santa Fe, N. Mex. in 1922. It was not ratified by Arizona, nor by the other States so as to make it effective until June, or approximately June 1929.

At that conference attempts were first made to divide the water between the States, and no agreement could be reached. Finally an agreement was reached dividing the water between the upper basin and the lower basin at Lee Ferry. They did not undertake to divide at that time all of the water of the stream because at that time it was calculated that the average annual flow was greatly in excess of the 15,000,000 acre-feet that was divided, 7,500,000 acre-feet to the Upper Basin, and 7,500,000 acre-feet to the lower basin.

Mr. PHILLIPS. That was in 1929?

Mr. CARSON. 1922 was when the compact was written.

At that conference, Arizona's representative, Mr. W. S. Norviel, was concerned because the over-all definition of the Colorado River System, as contained in the compact, did include and does now include the Gila River and its tributaries in Arizona which enter the river at Yuma below a point where they can ever be used again in the United States, and which were at that time wholly appropriated. So, Mr. Norviel refused to affix his signature to that compact until the provisions were written into the compact that are in article 3 (b) of the compact, which were added after this first draft had been completed and accepted by all the other States. I will read article 3 (b) for the record:

"In addition to the opportionment in paragraph (a) the lower basin is hereby given the right to increase its beneficial consumptive use of such waters by 1,000,000 acre-feet per annum."

Which was then the estimated use then being made of the Gila River. He would not sign it then until there was an oral understanding, not binding but an oral understanding and agreement between the States of California, Arizona, and Nevada, and accepted by all of the people attending that conference, that when that conference adjourned they would undertake to write out a tri-State compact between Arizona, California, and Nevada apportioning the water allocated to the

lower basin, and in that compact or contemplated tri-State compact, provide that the exclusive beneficial consumptive use of the water of the Gila River should go to Arizona.

At this point I woud like to insert in the record a letter and a picture, a letter from Mr. Herbert Hoover, who was chairman of that conference to Mr. W. S. Norviel, and a picture of Mr. Hoover also sent to Mr. Norviel, the picture carrying this notation, "W. S. Norviel, from Herbert Hoover—in tribute to a million acre-feet and a fine associate." The letter reads:

DEPARTMENT OF COMMERCE
OFFICE OF THE SECRETARY
WASHINGTON

LOS ANGELES, CALIF., *November 26, 1922.*

Mr. W. S. NORVIEL,
State Engineer, Phoeniz, Ariz.

MY DEAR NORVIEL: This is just by way of registering again my feelings of admiration for the best fighter on the commission. Arizona should erect a monument to you and entitle it "One million acre-feet."

I am sending you herewith a photograph which does not purport to be a likeness but it is a better-looking fellow than the one you have, and I send it as an excuse for writing this letter expressing my personal appreciation of this fine association which we have had.

Faithfully yours,

HERBERT HOOVER.

Mr. ROCKWELL. What is the date of that?

Mr. CARSON. November 26, 1922. The compact was signed in Santa Fe, N. Mex., November 24, 1922.

Mr. ROCKWELL. I thought you said something about the fact that it was not signed until 1929?

Mr. CARSON. The compact was signed at Santa Fe, N. Mex., November 22, 1922. It required ratification by the various States and the Congress before it could become effective, which was not brought about until 1929.

Then I should also like to put in the record the testimony of Gov. Thomas E. Campbell, who was then Governor of Arizona and in attendance upon this Santa Fe conference, given before the Colorado River Commission of Arizona in 1933 or 1934; I think it was 1933.

Mr. PHILLIPS. What is the document from which you are reading?

Mr. CARSON. I am reading from a brief that I prepared in 1934 for submission to the Secretary of the Interior, but which was not in fact filed with the Secretary.

Chairman MURDOCK. But this is testimony of Gov. Thomas Campbell.

Mr. CARSON. Yes, sir; Gov. Thomas E. Cambpell [reading]:

"TESTIMONY OF GOVERNOR THOMAS E. CAMPBELL GIVEN BEFORE THE ARIZONA-COLORADO RIVER COMMISSION

"Q. Were you present at the time of the execution of the Colorado River compact, at Santa Fe, N. Mex., on November 24, 1922?—A. Yes; I was present.

"Q. At that time what was your official position in the State of Arizona?—A. I was governor of the State of Arizona for the years 1919, 1920, 1921, and 1922; and was governor of the State of Arizona at the time of the conference at Santa Fe, and at the time the Colorado River compact was signed.

"Q. Were you present at Bishop's Lodge, near Santa Fe, N. Mex., during the negotiations and discussions leading up to the agreement that was signed at that time respecting the waters of the Colorado River?—A. Yes; I was.

"Q. Had you appointed Mr. W. S. Norviel as the representative of the State of Arizona at that conference?—A. No; I did not appoint Mr. Norviel as the representative of the State of Arizona. That was taken care of by the fact that the Enabling Act, which provided for a meeting of the representatives of the several Colorado River Basin States, designated the water commissioners of the several States as representatives at the conference. I had appointed Mr. Norviel as the water commissioner of Arizona, and during that year—1922—

Geo. Norvel from Herbert Hoover —
In tribute to a million acre feet and a
fine associate.

he was the qualified water commissioner, so that when the act was passed by the United States Congress, providing for the meeting of the representatives of the several States, he automatically became the representative from Arizona.

"Q. Do you recall who were present at the time of the Colorado River conference at Santa Fe during the fall of 1922?—A. Yes; I recall many of the persons who were there. The United States was represented by Herbert Hoover, who acted as chairman. He had been previously selected at a meeting in Washington. California was represented by W. F. McClure, who has since died; Colorado was represented by Delph E. Carpenter; Nevada by J. G. Scrugham; New Mexico by Stephen B. Davis, Jr.; Utah by R. E. Caldwell; Wyoming by Frank C. Emerson, who afterward became governor of Wyoming and has since died; and Arizona was represented by W. S. Norviel. The Reclamation Service was represented by Arthur P. Davis, and several advisers. Judge Richard E. Sloan was present in a legal capacity on behalf of Arizona besides Mr. Norviel and myself. California had many representatives, from the Imperial Valley and other places.

"Q. How was the conference organized?—A. Mr. Hoover acted as chairman; he had tendered the services of Clarence C. Stetson, of Maine, as secretary of the conference, and Mr. Stetson acted as secretary. The proceedings were taken down in shorthand, and I presume were transcribed, although I have never seen a copy.

"Q. The Enabling Act directed that the water of the river be divided among the States. Why was this not done?—A. We found it would be impossible, because every State at that time was claiming more water than was in the system, and early in the conference we came to the conclusion that it would not be possible to arrive at a compact which would definitely allot to each State any definite amount of water.

"Q. As the conference progressed, did you come to a solution of this question of division of the water?—A. Yes; we finally concluded a compact could be arrived at by dividing the water among the States represented by groups.

"Q. Then what was done?—A. It was the consensus of opinion, and agreed to, that the States be separated into two divisions, known as the upper basin and the lower basin. The upper basin was to include the States of Colorado, Utah, New Mexico, and Wyoming, and those comprising the lower basin were Arizona, California, and Nevada. It was further agreed that Lee Ferry would be a division point between the two basins and that would be the point considered for a division of the water—Lee Ferry and not at the so-called dam site. The division was to be 50–50 as to the amount of water, 7½ million acre-feet to the upper basin and 7½ million acre-feet to the lower basin. When the question of the system was presented to the Arizona delegates, composed of the State water commissioner, Judge Sloan, and myself, we objected vigorously to the inclusion of the waters of the Gila River, inasmuch as that water had been placed to beneficial use and would be of no value for storage at any place in the river for the lower basin States. After 2 days of discussions, mainly informal, it was finally agreed by the other participants in the compact that there would be allowed an extra million acre-feet, which was approximately the amount run off in the Gila system, to be used by Arizona to its exhaustion.

"Q. What attitude did the commission or the representatives from Arizona take toward the compact as written, and before the arrangement was made as to the million acre-feet—did you refuse to sign the compact because of the inclusion of the waters of the Gila River?—A. Absolutely we did. That was the reason why section 3B was put into the compact.

"Q. Was anything said about designating this million acre-feet for Arizona?—A. Yes, that was discussed, and it was concluded that we could not tag that as belonging to Arizona because the plan on which we proceeded was that the waters be divided among the basins and no particular water would be allowed to any one State. If we attempted to tag it, then every other State would demand that it get a certain amount of water.

"Q. Was there any agreement between the Arizona representative and the representatives of the other lower basin States as to setting aside to Arizona the water described in paragraph 3B of the proposed compact?—A. Yes, there was a definite understanding that after the seven-State compact was ratified, so far as the three States in the lower basin were concerned, they would enter into a compact in which it would be agreed that all of the water of the Gila River would go to Arizona.

"Q. Who were present at the discussions which resulted in that understand-

ing?—A. Mr. McClure, of California; Mr. Scrugham and Mr. Squires, of Nevada; and Mr. Norviel and myself, of Arizona.

"Q. Did these discussions take place before the execution of the compact on November 24, 1922?—A. That understanding was arrived at before the compact was ratified and signed.

"Q. For what purpose was the water of the Gila River to go to the State of Arizona?—A. For the benefit of Arizona and for use in irrigation.

"Q. At the time the discussions were had with reference to putting this paragraph 3B into the compact, did all of the delegates to the conference know that Arizona had objected to the compact without such a provision?—A. Absolutely; they all knew that was the fact; it was the lock upon which we had stuck for a couple of days, and discussions were had by all of the delegates and commissioners. I assume these discussions would appear in a transcript of the minutes; the fact was well known and discussed by everybody present. Without that provision of 3B, by which Arizona was awarded an extra million acre-feet of water for the inclusion of the water of the Gila River, the compact would never have been signed by Arizona.

'Q. Then after the arrangement was made for the inclusion of paragraph 3B in the compact, it met with the approval of Arizona, and Mr. Norviel signed the compact for Arizona?—A. He did.

"Q. Why was it that this understanding for the tri-State compact between California, Nevada, and Arizona, was not carried out?—A. The new administration in the State of Arizona was opposed to any compact and never went ahead.

"Q. Who was the Governor-elect of Arizona?—A. Gov. George W. P. Hunt defeated me in the November election of 1922, and with my going out of office, the continuity of the negotiations with respect to the carrying out of the compact were blocked and no progress was thereafter made.

"Q. Have you ever discussed this question of the Colorado River compact and the provision of this paragraph 3B since that time?—A. No, I have never been in court, or before any official body to present my knowledge of the understanding that was arrived at at that time. I have always been anxious to tell what took place at the conference and why the compact was drawn in the way that it was."

I also have the testimony of Mr. W. S. Norviel and of Mr. C. C. Lewis, who attended that conference, to the same effect, but I think it unnecessary at this time to encumber the record with it.

Chairman MURDOCK. May we see the picture in that little pamphlet? You had a picture there that I am interested in.

Mr. CARSON. I will be glad if you will tear the picture out of this book and put it in the record, and also the letter and the other statements by the other men also.

Chairman MURDOCK. I will pass this picture along to the committee. Some of you will recognize quite a change in Mr. Herbert Hoover of 1922—this picture may have been taken before 1922—and the elder statesman of today. I think this is material evidence that goes to show just what took place.

Without objection, we will include the testimony of Mr. Norviel and Mr. Lewis.

Mr. CARSON. The testimony is in this brief, and it is to the same effect as that of Governor Campbell.

Chairman MURDOCK. It was testimony given before the same board as Governor Campbell's testimony?

Mr. CARSON. Yes.

(The matter referred to is as follows:)

"TESTIMONY OF MR. W. S. NORVIEL GIVEN BEFORE THE ARIZONA-COLORADO RIVER COMMISSION

"Q. State your name, residence, and profession.—A. W. S. Norviel, Phoenix, Ariz., attorney at law.

"Q. How long have you been a practicing lawyer in Arizona?—A. Since 1916, except two short periods.

"Q. Are you still active in the practice?—A. Yes.

"Q. In 1922, what, if any, was your official position in Arizona?—A. State water commissioner.

"Q. By reason of your being water commissioner, were you designated as a commissioner under the Federal enabling act respecting the division of the waters of the Colorado River?—A. Yes.

"Q. Did the State water commissioners of the State of Arizona, California, Nevada, New Mexico, Wyoming, Utah, and Colorado meet pursuant to the provisions of the enabling act?—A. Yes. That is, those having charge of public waters, mostly called State engineers, met.

"Q. Where did you first meet?—A. Washington.

"Q. Who was elected chairman?—A. Herbert Hoover, then Secretary of Commerce.

"Q. Was Mr. Hoover designated by the Federal authorities as the United States representative?—A. Yes.

"Q. Who was the secretary of the conference?—A. Clarence C. Stetson was made executive secretary.

"Q. How long did the meeting at Washington last?—A. Four or five days.

"Q. What matters were discussed at Washington?—A. It was the first coming together of the commissioners. After the organization, the representatives were called upon to express ideas as to the proper procedure to accomplish the purposes of the congressional act and the acts of the several State legislatures. I presented a written proposed compact, and discussion then followed upon it.

"Q. Did the question first come up at the Washington conference of dividing the waters, not among the States, but between two groups of States, namely, the upper basin and the lower basin?—A. At the Washington meeting we discussed the division of the waters among the several States, but it immediately was apparent that there never could be an accord as to the proper allocation to each State.

"Q. Before the conference broke up at Washington in January 1922 did you accomplish anything definite with respect to an agreement on the division of the waters?—A. No. The commissioners were without sufficient information and were unwilling to be bound to anything definite, save procedure.

"Q. After the Washington meeting in January 1922, when did you next meet?—A. Public hearings were held in various cities of the interested States.

"Q. Did the conference convene in Santa Fe, N. Mex., in November 1922?—A. Yes.

"Q. Was the meeting in Santa Fe, N. Mex., in November 1922, a continuation of the Washington meeting, with the same persons present and the same States represented?—A. Yes.

"Q. Was Mr. Hoover present?—A. Yes.

"Q. Did Mr. Hoover preside as chairman and did Mr. Stetson serve as secretary?—A. Yes. At all the meetings.

"Q. Were the minutes of that meeting taken down stenographically?—A. Yes.

"Q. Have you a copy of those minutes?—A. No.

"Q. Have you ever seen a transcript of the stenographic record?—A. No.

"Q. Did you at that meeting agree to divide the waters of the Colorado River between two groups of States, designated as the upper and lower basins?—A. Yes.

"Q. Why was that done, rather than divide the waters among the several States, allocating to each State a definite amount?—A. It was agreed that insurmountable difficulties would block any effort to allocate to the several States a definite portion of the water. The general consensus being often expressed that nothing should be granted to a single State, no State or stream particularly or otherwise favored or hindered.

"Q. In the compact that was finally signed, in paragraph (a), article II, the Colorado River system is defined, and in paragraph (b), article II, the Colorado River Basin is defined, which terms include the Gila River and its tributaries. Why was the Gila River included in the Colorado River compact?—A. The terms "Colorado River system" and "Colorado River Basin" were defined to include all the streams tributary to the Colorado River and the area draining into the Colorado River, and it was deemed advisable to make no exceptions of any particular tributary. Arizona objected vigorously to the inclusion of the Gila River, but our objections were overruled.

"Q. Is it true that in November 1922 the Gila River was then in use, or had been appropriated completely?—A. Yes.

"Q. Is it not a fact that the Gila River enters the Colorado River below the point where all interested parties contemplated the dam would be built?—A. Yes.

"Q. At the November 1922 conference, what was the consensus of opinion as to where the first dam would be built in the river?—A. It was the general opinion that such dam would be located in Boulder Canyon.

"Q. Was this point not above the point where the Gila River enters the Colorado River?—A. Yes.

"Q. Could any States benefit by the fact that the Gila was included in the

Colorado River system?—A. No. Its waters enter the main stream of the Colorado at a point which prevents the use of the Gila waters within the United States.

"Q. Were those matters discussed at this meeting?—A. Yes. It was my contention that only Arizona could use or had a right to Gila waters.

"Q. Did you point out that the definition "Colorado River system" included the Gila River system in the division of the waters?—A. I raised the question and demanded the Gila be specifically excluded.

"Q. What position did you take on the inclusion of the Gila River in the compact?—A. That it be excluded entirely from the discussion. Later we compromised when the conference granted an extra million acre-feet to Arizona. This extra million acre-feet was intended for the sole use of Arizona to compensate for the inclusion of the Gila River as part of the Colorado River system. Following the predetermined plan of allocating no water to any particular State, but to groups or basins only, the provision for this extra million acre-feet was couched in language as used elsewhere in the compact; that is, it read to the lower basin, rather than to Arizona, but it was definitely understood that this additional water was for the exclusive use of Arizona.

"Q. Was the draft of the compact prepared and submitted to the conference before it was finally signed up?—A. Yes.

"Q. After the compact was submitted, how many days elapsed before it was actually signed?—A. Some 4 or 5 days elapsed, during which time we were attempting to dispose of this Gila River matter.

"Q. At the time the draft was submitted, and you testify that it was several days before it was signed, did that draft include paragraph (b) of article III, of the Colorado River compact?—A. No. The draft merely included the Gila as part of the Colorado River system. It did not contain the provision now known as III (b) which made provision for the allocation of the extra million acre-feet to the lower basin.

"Q. Do you have the copy of the proposed contract which did not contain the provision with reference to the million acre-feet, to which you have referred?—A. Yes.

"Q. Is this the original copy that you had at the meeting in Santa Fe?—A. Yes; except that there are some notes that I made in this copy at or during the meeting November 22, or in the succeeding days.

"Q. I hand you a document and ask you if that is the original.—A. Yes. It is.

"Q. It shows the date of November 18, 1922. Is that the date that you first received it?—A. It would indicate that it was first handed in at that time, and we then began the discussion.

"Q. You refused to sign that draft of the compact?—A. Yes.

"Q. Why?—A. Because it included the Gila River and made no provision for compensation to Arizona.

"Q. You had that draft before you, and you declared Arizona's position before the Conference?—A. Yes.

"Q. After that a new compact was prepared which did contain a provision for compensation to Arizona, known as paragraph (b) of article III?—A. Yes.

"Q. That compact was consented to by you and executed on November 24, 1922?—A. Yes.

"Q. Who prepared paragraph (b) of article III of the Colorado River compact as signed?—A. Judge Sloan and Stephen B. Davis, and one other whom I do not recall.

"Q. What discussion was had relating to the said paragraph (b) of article III and its meaning and purpose?—A. I had steadfastly refused to agree to the original draft that merely included the Gila River and after several days of discussion and argument, during which the conference refused to exclude the Gila and I refused to accept the draft which included the Gila, a compromise was reached in the form of article III (b) which provided the extra million acre-feet to compensate Arizona for the inclusion of the Gila River in the Colorado River system. It was fully understood by all that this million acre-feet was for the sole and exclusive use of Arizona, although the language used provided for its use by the lower basin. I have explained why such wording was used.

"Q. Was the answer that you have given of the meaning and purpose discussed at the full meeting of all the delegates at this conference, including California and Nevada?—A. Yes. All the delegates, including California and Nevada, understood and agreed that this additional water was for Arizona's use.

"Q. Will you state if you made any statement to the Colorado River Commission with reference to the definition given to the Colorado River system and the Colorado River Basin, and the meaning of paragraph (b), article III?—A. Yes.

I did make a statement. I asked the conference if it was the understanding of the Commission that the million acre-feet of water set out in article III (b) was for the sole and exclusive use of Arizona and stated that if that was the understanding I would sign the compact, if it was not the understanding I would refuse to sign. The unanimous reply was that this million acre-feet was for Arizona alone. With that understanding I signed the compact for Arizona.

"Q. Were these statements which you made stated to the open conference?—A. All delegates and representatives were present. We were having a final meeting preparatory to the signing of the compact.

"Q. What response did delegates from the other States, including California and Nevada, make in regard to your statements?—A. They agreed in the understanding which I have just stated. Mr. McClure, of California, stated to me and to the conference that he, as the California representative at the conference agreed to the understanding that this water of article III (b) was for he exclusive use of Arizona.

"Q. What response did Mr. Hoover make?—A. Mr. Hoover did not take part in the discussion, did not state his views on any part, as I remember. He urged us to agree, and sometimes referred us to a former agreement, or purported agreement.

"Q. Was there any statement made at that time contrary to the explanations that had been given as to the meaning and intent of paragraph (b) article III of the compact?—A. None whatever; there was a full accord and agreement by all delegates.

"Q. At that time, what, if anything, was said in reference to a tri-State agreement between the representatives of California and Nevada and Arizona and Mr. Hoover?—A. It was several times suggested that there should be no difficulty for the three lower States to agree to a division of the waters allocated to the lower basin.

"Q. Were these statements, with reference to a tri-State agreement, made prior to the time the compact was actually signed?—A. Yes, and Mr. Squires made some statements afterward. Mr. McClure, Mr. Scrugham, and Mr. Squires expressed their willingness to enter into such a compact. It seemed very feasible.

"Q. Did each and every one signing the Colorado River Compact know of the discussion with reference to the supplemental tri-State compact to be executed by California, Nevada, and Arizona?—A. Yes. It had been discussed in the open conference and Mr. Hoover made several suggestions regarding such a tri-State compact.

"Q. Was there ever any statement made by anyone at the conference that the waters of the Gila River were to go to anybody except the State of Arizona?—A. None whatever.

"Q. Was any claim ever made at that time that any other State had any interest in the waters of the Gila River?—A. No.

"Q. Was there a universal agreement by each and every one of the delegates that the Gila River belonged to the State of Arizona?—A. That was the agreement upon which I consented to sign the compact for Arizona.

"Q. In addition to the waters of the Gila River, was Arizona to participate in the division of the waters in the main stream of the Colorado River?—A. Yes. Arizona was to share in the main stream waters.

"Q. Were these matters discussed at the time of the conference?—A. Yes. To the extent that Arizona, Nevada, and California were to all share in the main stream waters and Arizona was to have the exclusive use of the waters of the Gila.

"Q. Did you make any statement that if the Colorado River had any different meaning from what you have testified, you would not sign the compact?—A. I stated that I would absolutely refuse to sign the compact if it had any other meaning.

"Q. Did the representatives of the other States and the chairman agree to your statement?—A. Yes. All, including California and Nevada, agreed.

"TESTIMONY OF MR. C. C. LEWIS GIVEN BEFORE THE ARIZONA-COLORADO RIVER COMMISSION

"Q. State you name, residence, and profession.—A. C. C. Lewis, Phoenix, Ariz., statistician.

"Q How long have you been in Arizona?—A. Twenty-four years.

"Q. In 1922, what, if any, was your official position in Arizona?—A. Assistant State water commissioner.

"Q. By reason of your being deputy water commissioner, did you attend the meetings held under the Federal Enabling Act, respecting the division of the waters of the Colorado River?—A. Yes; except the first meeting held at Washington, D. C.

"Q. Did the conference convene in Santa Fe, N. Mex., in November 1922?—A. Yes.

"Q. Was the meeting in Santa Fe, N. Mex., in November 1922 a continuation of the Washington meeting, with the same persons present and the same States represented?—A. Yes; as I recall it, the same persons were representatives.

"Q. Was Mr. Hoover present?—A. Yes.

"Q. Did Mr. Hoover preside as chairman and did Mr. Stassen serve as secretary?—A. Yes.

"Q. Were the minutes of that meeting taken down stenographically?—A. Yes.

"Q. Have you a copy of those minutes?—A. No.

"Q. Have you ever seen a transscript of the stenographic record?—A. No.

"Q. Did you at that meeting agree to divide the waters of the Colorado River between two groups of States, designated as the upper and lower basins?—A. Mr. Norviel, Arizona State water commissioner, did.

"Q. Why was that done, rather than divide the waters among the several States, allocating to each State a definite amount?—A. Because of the impossibility of ever agreeing on an apportionment among the seven States. It was not practical. Further, there was a point provided by nature for the division line between the upper and lower basins.

"Q. In the compact that was finally signed, in paragraph (a), article II, the Colorado River system is defined, and in paragraph (b), article II, the Colorado River Basin is defined, which terms include the Gila River and its tributaries. Why was the Gila River included in the Colorado River compact?—A. The Gila River was included, because it was determined that the drainage area should include all tributaries of the Colorado River in all of the seven States, and that it was inadvisable to make any exceptions. Arizona objected to the inclusion of the Gila River because of the fact the waters could be applied to beneficial use only by Arizona.

"Q. Is it true that in November 1922, the Gila River was then in use, or had been appropriated completely?—A. Yes. That which was not being used had been appropriated.

"Q. Is it not a fact that the Gila River enters the Colorado River below the point where all interested parties contemplated the (dam) would be built?—A. Yes.

"Q. At the November 1922 conference, what was the consensus of opinion as to where the first dam would be built in the river?—A. Boulder Canyon.

"Q. Was this point not above the point where the Gila River enters the Colorado River?—A. Yes.

"Q. Could any States benefit by the fact that the Gila was included in the Colorado River system?—A. Not by the use of the Gila waters because the Gila enters at a point that would prevent the use of same in the United States.

"Q. Were those matters discussed at this meeting?—A. Yes. It was contended that Arizona only could use the Gila waters, and it being entirely appropriated, it should be excluded.

"Q. Did Mr. Norviel point out that the definition 'Colorado River system' included the Gila River system in the division of the waters?—A. Yes. On this point he was firm.

"Q. What position did Mr. Norviel and the Arizona delegation take on the inclusion of the Gila River in the compact?—A. That it should be excluded and did not yield until a million acre-feet additional was granted the lower basin States with a definite understanding by all that this additional million acre-feet was for Arizona's use and not to be considered in the final apportionment of the Colorado River water.

"Q. Was the draft of the compact prepared and submitted to the conference before it was finally signed up?—A. Yes.

"Q. After the compact was submitted, how many days elapsed before it was actually signed?—A. I do not remember, but a few days on account of Gila River matters.

"Q. At the time the draft was submitted, and you testify that it was several days before it was signed, did that draft include paragraph (b) of article III, of the Colorado River compact?—A. No.

"Q. Did you see the copy of the proposed contract which did not contain the

provision with reference to the million acre-feet, to which you have referred?—A. Yes.

"Q. This instrument which I hand you. Is this the original copy which you and Mr. Norviel had at the meeting at Santa Fe?—A. Yes.

"Q. It shows the date of November 18, 1922. Is that the date that you first received it?—A. I could not say, but it seems the date thereon would so indicate.

"Q. Mr. Norviel refused to sign that draft of the compact?—A. Yes.

"Q. Why?—A. Because of the inclusion of the Gila River.

"Q. This draft was before the Arizona delegation and Arizona's position was made known to the conference?—A. Yes. It was contended that the Gila River water was not only all appropriated, but if it were never appropriated no other State could possibly use it because of the physical situation obtaining.

"Q. After that a new compact was prepared which did contain a provision for compensation to Arizona known as paragraph (b) of article III?—A. Yes.

"Q. That compact was consented to by Mr. Norviel and the Arizona delegation and executed on November 24, 1922?—A. Yes.

"Q. Who prepared paragraph (b) of article III of the Colorado River compact, as signed?—A. Judge Sloan, Judge S. B. Davis, and Frank C. Emerson.

"Q. What discussion was had relating to the said paragraph (b) of article III and its meaning and purpose?—A. Due to Mr. Norviel's firm refusal to sign the compact with the Gila River included there were several days' delay and the final result was paragraph (b) of article III, with the definite understanding that this million acre-feet belonged to Arizona in compensation for inclusion of the Gila River in the Colorado River system.

"Q. Was the answer that you have given of the meaning and purpose discussed at the full meeting of all the delegates at this conference, including California and Nevada?—A. Yes.

"Q. Will you state if Mr. Norviel and the Arizona delegation made any statement to the Colorado River Commission with reference to the definition given to the Colorado River system and the Colorado River Basin, and the meaning of paragraph (b), article III?—A. Yes. Mr. Norviel made it very clear that he would sign the final draft of the compact only on the full and complete understanding by all that the additional million acre-feet was for the use of Arizona alone. To this Mr. McClure, representing California, agreed and all others joined in and agreed to this understanding.

"Q. Were these statements made to the open conference?—A. Yes.

"Q. What response did delegates from the other States, including California and Nevada, make in regard to these statements?—A. They all agreed, Mr. McClure making a statement to this effect, all others agreeing, including Nevada."

Mr. CARSON. Now then, subsequent to the signing of the Colorado River compact, various efforts were made between Arizona and California to work out an agreement. During that interval, Arizona thought that she was entitled to the exclusive beneficial consumptive use of the Gila River and half the water flowing in the main stream in the lower basin other than that required by Nevada, to be divided equally between California and Arizona. You see, that would have resulted in Arizona securing 3,600,000 acre-feet of the main-stream water allocated to the lower basin, and it should not seem such an unreasonable request when you consider that that is the sole supply of water for Arizona, which contains in excess of 100,000 square miles of land.

California contains 4,000 square miles of land—and this area that I am describing is within the basin in California—and in California there are no streams of any consequence feeding the Colorado River, and California wanted to take the great bulk of her water outside of the natural drainage area of the Colorado River Basin and over into the Imperial Valley from which no return flow whatever can reach the Colorado River, and over to the Los Angeles area from which no return flow whatever can reach the Colorado River.

Mr. FERNANDEZ. Where is Lee Ferry?

Mr. CARSON. This dotted line [indicating at map] is the division between the upper and lower basins, as made by the compact. You will notice that all of Arizona is within the basin of the compact except this very small area [indicating] in the southeast corner of the State. The State is square at that point.

Mr. ROCKWELL. Where is Lee Ferry compared to Boulder Dam?

Mr. CARSON. This is Lee Ferry, and Boulder Dam is down here [indicating] on the State line between Nevada and Arizona. The thread of the stream there is the boundary between Arizona and Nevada.

Those efforts thereafter made during that period to reach an agreement were not successful, and no agreement was reached.

In the meantime, the California financiers were pressing for the construction of Boulder Dam and the Swing-Johnson bill had been introduced and further efforts were made to reach an agreement on the division of the main stream of the river. Those efforts finally resulted in a governors' conference in Denver, Colo., in the fall of 1927. It had been postponed from consideration by Congress that spring at our request, to see whether or not we could by further efforts compose our differences.

At Arizona's request a governors' conference was held in Denver, Colo., in the fall of 1927 in two sessions; one lasted from August 22 to September 1, and one from September 19 to October 4. At that meeting the governors of the seven river basin States were present. For Arizona, Governor Hunt; California, Gov. C. C. Young; Colorado, Governor Adams. William H. Adams; New Mexico, Gov. Richard G. Dillon; Nevada, Gov. F. B. Balzar; Utah, Gov. H. Dern; Wyoming, Gov. Frank B. Emerson. They were each accompanied by various advisers.

California and Arizona stated their positions. They were unable to agree. Governor Young stated there, as has been stated here in the hearing, that California would be willing to submit the controversy to any impartial tribunal. It was not a binding agreement. I do not want to be misunderstood; it was not in any way binding, but the four governors of the upper basin States constituted themselves as such an arbitration committee and called in separately California and Arizona and finally made this recommendation which I would like to read into the record:

"Suggested basis of division of water between the States of the lower division of the Colorado River system submitted by the governors of the States of the upper division at Denver conference, August 30, 1927.

"The governors of the States of the upper division of the Colorado River system suggested the following as a fair apportionment of water between the States of the lower division subject and subordinate to the provisions of the Colorado River compact insofar as such provisions affect the rights of the upper basin States:

"1. Of the average annual delivery of water to be provided by the States of the upper division at Lee Ferry, under the terms of the Colorado River compact.

"(*a*) To the State of Nevada, 300,000 acre-feet.

"(*b*) To the State of Arizona, 3,000,000 acre-feet.

"(*c*) To the State of California, 4,200,000 acre-feet."

You will note that is a reduction in Arizona's contention that she was entitled to half the water, from 3,600,000 acre-feet to 3,000,000 acre-feet.

"2. To Arizona, in addition to water apportioned in subdivision (b), 1,000,000 acre-feet of water, to be supplied from the tributaries of the Colorado River flowing in said State and to be diverted from said tributaries before the same empty into the main stream. Said 1,000,000 acre-feet shall not be subject to diminution by reason of any treaty with the United States of Mexico, except in such proportion as the said 1,000,000 acre-feet shall bear to the entire apportionment in 1 and 2 of 8,500,000 acre-feet.

"3. As to all waters of the tributaries of the Colorado River emptying into the river below Lee Ferry, not apportioned in paragraph 2, each of the States of the lower basin shall have the exclusive beneficial consumptive use of such tributaries within its boundaries before the same empty into the main stream, provided the apportionment of the waters of such tributaries situated in more than one State shall be left to adjudication or apportionment between said States in such manner as may be determined upon by the States affected thereby.

"4. The several foregoing apportionments to include all waters necessary for the supply of any rights which may now exist, including water for Indian lands for each of said States.

"5. Arizona and California each may divert and use one-half of the unapportioned waters of the main Colorado River flowing below Lee Ferry, subject to further equitable apportionment between the said States after the year 1933, and on the specific condition that the use of said waters between the States of the lower basin shall be without prejudice to the right of the States of the upper basin to further apportionment of water, as provided by the Colorado River compact."

That was in the fall of 1927.

Then the Swing-Johnson bill came up again the following year in Congress.

I might state before leaving this that when these findings were presented the Arizona delegation said they would accept the recommendations made and California refused to accept the recommendations made. Then the matter came on before the Congress in the consideration of the Boulder Canyon Project Act, which was enacted in December of 1928, and Congress undertook to give effect

to this recommendation of the four upper State Governors, and did it in several ways in that act.

I am now reading from the Boulder Canyon Project Act, section 4 (a), at the beginning of the second paragraph of that act:

"The States of Arizona, California, and Nevada are authorized to enter into an agreement which shall provide, (1) that of the 7,500,000 acre-feet annually apportioned to the lower basin by paragraph (a) of article III of the Colorado River compact, there shall be apportioned to the State of Nevada 300,000 acre-feet and to the State of Arizona 2,800,000 acre-feet for exclusive beneficial consumptive use in perpetuity," I call your attention there to the fact that Congress again reduced Arizona's claim, as approved by the upper basin governors, from 3,000,000 to 2,800,000 acre-feet—"and (2) that the State of Arizona may annually use one-half of the excess or surplus waters unapportioned by the Colorado River compact; and (3) that the State of Arizona shall have the exclusive beneficial consumptive use of the Gila River and its tributaries within the boundaries of said State.

"4. That the waters of the Gila River and its tributaries, except return flow after the same enters the Colorado River, shall never be subject to any diminution whatever by any allowance of water which may be made by treaty or otherwise to the United States of Mexico; but if, as provided in paragraph (c) of article III of the Colorado River compact, it shall become necessary to supply water to the United States of Mexico from waters over and above the quantities which are surplus as defined by said compact, then the State of California shall and will mutually agree with the State of Arizona to supply, out of the main stream of the Colorado River, one-half of any deficiency which must be supplied to Mexico by the lower basin; and

"5. That the State of California shall and will further mutually agree with the States of Nevada and Arizona that none of said three States shall withhold water and none shall require the delivery of water which cannot reasonably be applied to domestic and agricultural uses; and

"6. That all the provisions of said tri-State agreement shall be subject in all particulars to the provisions of the Colorado River compact; and

"7. Said agreement to take effect upon the ratification of the Colorado River compact by Arizona, California, and Nevada."

Even though Arizona was at that time, perhaps, somewhat in the doghouse, which I have always considered to be partially due to the fact that Mr. Harry Chandler, who is now deceased, the owner of the Los Angeles Times, and perhaps Mr. Hearst—and I am not certain but that Mr. Hearst was the owner of lands in Mexico—but during this period after the Colorado River compact was signed, the press of the country tried to indicate that Arizona was a dog in the manger and should have agreed without anything further to the Colorado River compact and without division between California and Arizona.

Now, remember, if you please, that Arizona was a very young State, not a strong State, and was going up against the financial power of the most powerful men in southern California, so Congress, in order to see that this provision would be carried out by California, provided further—

"This Act shall not take effect * * * until the State of California, by act of its legislature, shall agree irrevocably and unconditionally with the United States and for the benefit of the States of Arizona, Colorado, Nevada, New Mexico, Utah, and Wyoming, as in express covenant and in consideration of the passage of this Act, that the aggregate annual consumptive use (diversions less returns to river) of water of and from the Colorado River for use in the State of California, including all uses under contracts made under the provisions of this Act and all water necessary for the supply of any rights which may now exist, shall not exceed four million four hundred thousand acre-feet of the waters apportioned to the lower basin States by paragraph (a) of article III of the Colorado River compact, plus not more than one-half of any excess or surplus waters unapportioned by said compact, such uses always to be subject to the terms of said compact."

I want to call your attention specifically to the fact that under this limitation with California enacted by an act of its legislature in 1929, in exact compliance with this requirement, III (b) water is not mentioned. California cannot lawfully use any water of the Colorado River system except 4,400,000 acre-feet of III (a) water, plus not more than one-half of any excess or surplus waters unapportioned by said compact.

So now the question comes, Is III (b) water apportioned water? If it is,

California by her limitation act has excluded herself from making any claim to it.

In that connection, let me go further into what Congress was trying to do in this. This is section 11 of the act.

"That the Secretary of the Interior is hereby authorized to make such studies, surveys, investigations, and to do such engineering as may be necessary to determine the lands in the State of Arizona that should be embraced within the boundaries of a reclamation project, heretofore commonly known and hereafter to be known as the Parker-Gila Valley reclamation project, and to recommend the most practical and feasible method of irrigating lands within said project, or units thereof, and the cost of the same, and the appropriation of such sums of money as may be necessary for the aforesaid purposes, from time to time is hereby authorized. The Secretary shall report to Congress as soon as practicable, and not later than December 10, 1931, his findings, conclusions, and recommendations regarding such project."

Now, at that time, the Parker-Gila project included not only the 585,000 acres that was later mentioned in the Porter J. Preston report, but also an additional 100,000 acres in the vicinity of Parker, Ariz., which is up the river from all projects here involved. It is in this vicinity up here [indicating at map] above the Palo Verde Valley and in the town of Blythe, and a bit more of it is right in here. At that time the project included this land and this land down here to the extent of 585,000 acres [indicating] of which 585,000 acres this mesa division of the Yuma project and the Wellton-Mohawk area are a very small part.

Now, to go back again a minute to the compact on whether or not III (b) water is apportioned water, I would like to read into the record here these provisions of the Colorado River compact. I am reading article 3 (a).

"There is hereby apportioned from the Colorado River system in perpetuity to the upper basin and to the lower basin, respectively, the exclusive beneficial consumptive use of 7,500,000 acre-feet of water per annum, which shall include all water necessary for the supply of any rights which may now exist.

"(b) In addition to the apportionment in paragraph (a) the lower basin is hereby given the right to increase its beneficial consumptive use of such waters by 1,000,000 acre-feet per annum.

"(c)—"

and this is important, in my estimation, in considering this bill—

"If, as a matter of international comity, the United States of America shall hereafter recognize in the United States of Mexico any right to the use of any waters of the Colorado River system, such waters shall be supplied, first, from the waters which are surplus over and above the aggregate of the quantities specified in paragraphs (a) and (b); and if such surplus shall prove insufficient for this purpose, then the burden of such deficiency shall be equally borne by the upper basin and the lower basin, and whenever necessary the States of the upper division shall deliver at Lee Ferry water to supply one-half of the deficiency so recognized in addition to that provided in paragraph (d).

"(d) The States of the upper division will not cause the flow of the river at Lee Ferry to be depleted below an aggregate of 75,000,000 acre-feet for any period of 10 consecutive years reckoned in continuing progressive series beginning with the first day of October next succeeding the ratification of this compact.

"(e) The States of the upper division shall not withhold water, and the States of the lower division shall not require the delivery of water which cannot reasonably be applied to domestic and agricultural uses.

"(f) Further equitable apportionment of the beneficial uses of the waters of the Colorado River system unapportioned by paragraphs (a), (b), and (c) may be made in the manner provided in paragraph (g) at any time after October 1, 1963, if and when either basin shall have reached its total beneficial consumptive use as set out in paragraphs (a) and (b)."

It is clear there, to my mind, that (b) water is apportioned water, and that (c) water, to Mexico, when and if the quantity is determined, is likewise apportioned water.

Let me emphasize that again:

"Further, equitable apportionment of the beneficial uses of the waters of the Colorado River system, unapportioned by paragraphs (a), (b), and (c), may be made in the manner provided * * *."

So, back there in 1922, when this contract was signed, all the States of the basin recognized the possibility and the desirability, if you please, of a treaty with Mexico, which would fix the limits of Mexico's rights, and went so far as to pro-

vide in this contract in 1922 how that supply would be furnished and who would furnish it.

Then, coming on down—and I will be through with this historical background shortly—in 1933 I was at that time employed as a special assistant attorney general and counsel for the Arizona and Colorado River Commission, and continued until the spring or the summer of 1935. They submitted to me questions concerning the construction which I have just referred to you, and I gave it as my legal opinion then, and do now, that under those provisions of the California Limitation Act, as required by the Boulder Canyon Project Act, California can make no successful claim whatever to any use of the water of the Gila River, or to a claim of an equal amount, or any portion of that amount in the main stream of the river. The Commission knew of course what had occurred at the Santa Fe Conference in 1922, so they requested that I bring a bill into the United States Supreme Court rights to perpetuate testimony of what occurred at Santa Fe in 1922, some evidence of which I have already placed in this record. I did file such a bill in the Supreme Court of the United States.

The Supreme Court of the United States took jurisdiction of the case and said that it was properly brought, but they refused the right to perpetuate testimony; one of the grounds being it was immaterial and could never become material. I would like to read to you now part of paragraph 6 of the Supreme Court's opinion appearing in volume 292, United States, at page 359.

"Sixth. The considerations to which Arizona calls attention do not show that there is any ambiguity in article III (b) of the compact. Doubtless, the anticipated physical sources of the waters which combine to make the total of 8,500,000 acre-feet are as Arizona contends, but neither article III (a) nor (b) deal with the waters on the basis of their source. Paragraph (a) apportions waters 'from the Colorado River system,' i. e., the Colorado and its tributaries and (b) permits an additional use 'of such waters.' The compact makes an apportionment only between the upper and lower basin; the apportionment among the States in each basin being left to later agreement. Arizona is one of the States of the lower basin and any waters useful to her are by that fact useful to the lower basin. But the fact that they are solely useful to Arizona, or the fact that they have been appropriated by her, does not contradict the intent clearly expressed in paragraph (b)—"

Now, this is the part—"* * * does not contradict the intent clearly expressed by paragraph (b) (nor the rational character thereof) to apportion the 1,000,000 acre-feet to the States of the lower basin and not specifically to Arizona alone."

Now, can there be any doubt that under that language and under the language of this compact that III (b) water is apportioned to the lower basin? Can there be any doubt that California, by adopting its limitation act, has excluded herself from claiming any part of the III (b) water?

Mr. PHILLIPS. My recollection is not very clear on that. Will you read section 7, please?

Mr. CARSON. Yes. That is another ground for the dismissal. California filed briefs in opposition to this. They did not want this evidence preserved, which is now in this record and, among others, there was the question raised that it was not in proper form and was not relevant because it had not been communicated back. And in that connection they also raised this other ground that it was immaterial and irrelevant. The committee said it was not material or relevant because California has excluded herself from claiming III (b) water [reading]:

"Seventh. Even if the construction to be given paragraph (b) of the compact were relevant to the interpretation of any provision in the Boulder Canyon Project Act and such provision were ambiguous, the evidence sought to be perpetuated is not of a character which would be competent to prove the Congress intended by paragraph 4 (a) of the 1928 act to exclude California entirely from the waters allotted by article III (b) to the States of the lower basin and to reserve all of those waters to Arizona. The evidence sought to be perpetuated is not documentary. It is testimony as to what divers persons said 6 years earlier while negotiating a compact with a view to preparing the proposal for submission to the legislatures of the seven States and to Congress for approval—a proposal which Arizona has not ratified and which the six other States and Congress did ratify, as later modified, by statutes enacted in 1928 and 1929. The Boulder Canyon Project Act rests, not upon what was thought or said in 1922 by negotiators of the compact, but upon its ratification by the six States."

I think I have pretty well covered that. Now, following the enactment of the

Boulder Canyon Project Act by Congress and this decision, we tried to secure a contract from the United States for our share of this water. We were opposed by California on the ground, among others, that we had not ratified the Colorado River compact. So, in 1939, the Arizona Legislature enacted chapter 33 (ch. 33, Session Laws of Arizona, 1939) in which it provided, and the compact set out in here in terms is as nearly as we could draw it taken from the Boulder Canyon Project Act in paragraph 4 (a) of the Boulder Canyon Project Act, with the addition of the necessary definitions to make it clear:

"SECTION 1. TRI-STATE COMPACT.—The State of Arizona desiring to enter into a compact with the States of California and Nevada under the authority of and in accordance with the provisions of the act of Congress of the United States of America approved December 21, 1928, proposes the following compact or agreement between the States of Arizona, California, and Nevada."

Then it sets it out. Section 2 of the act, after setting out the proposed compact, provides:

"SEC. 2. ACCEPTANCE BY ARIZONA.—The proposed agreement between the States of Arizona, California, and Nevada as set forth in section 1 of this act is approved and accepted for the State of Arizona, and the Governor of the State of Arizona is authorized and directed to sign said agreement for the State of Arizona and to give notice of its aprpoval as in said agreement provided.

"SEC. 3. CONDITIONAL APPROVAL OF COLORADO RIVER COMPACT.—If the agreement set forth in section 1 of this act be approved by the Congress of the United States and the States of California and Nevada within 1 year after the effective date of this act, or within a period of one additional year thereafter, provided the Governor of the State of Arizona shall by proclamation so extend the period for such approval, the Colorado River compact shall thereupon be and become by the terms of this act ratified for and on behalf of the State of Arizona."

Now, following the passage of that act, it is my understanding there were numerous meetings between the Colorado River Commission of Arizona and the representatives of California to try to work out this compact, on which Commission at that time Senator Hugo Farmer was a member, who is now here. That was rejected by California and no agreement could be made.

Now, I have to go back again a little to the physical situation. Boulder Dam was built and filled. I might be in error on this date, but it became full by some time in 1938 or 1939, so that it was no longer able to hold back the flow of the river which came down, and in 1941 12,000,000 acre-feet of Colorado River water went across the border into Mexico. In 1942 something in excess of 11,000,000 acre-feet, and 1943, in excess of 10,500,000 acre-feet went across the border into Mexico.. Now, when Boulder Dam began to regulate the flow of the Colorado River through Mexico, it enabled a much greater development of Mexico below the United States border. In its natural state, as I understand the picture, in the late summer when water was needed for irrigation it was not in the river. Boulder Dam operated to equate that flow so that the flow here [indicating] that I have called attention to went through Mexico in an equated condition. It benefited Mexico in many ways. It eliminated the danger of floods and seasonal floods in the lower delta of Mexico and assured them a full supply of water there when they needed it for irrigation purposes.

Now, during that period, from the time we tried to get a contract in 1934, and an agreement, the uses in Mexico were rapidly expanded and built up to use a great deal more water in Mexico. It has been variously estimated by the engineers as to the quantity of land in Mexico that could be irrigated by water from the river, and I think a conservative estimate was approximately 1,000,000 acres which could establish a right to the use of water in Mexico, with a possibility of Mexico's increasing its use of water to 5,000,000 or 6,000,000 acre-feet, if we permitted that development to proceed without the Mexican Treaty limiting their right in advance of the development of the river basin in the upper States as well as in the lower States.

Then we found the Imperial irrigation district of California, as soon as the All-American Canal was in operation, increased its supply of water to Mexico through that canal and we found that the Imperial irrigation district of California owned, and I believe still owns, all of the stock of the Mexican corporation which delivers water through the Alamo Canal in Mexico to Mexican land. So that by 1943 and again in 1944 Mexico actually diverted and used on her lands from the Colorado River, with the aid and support of the Imperial irrigation district of California, 1,800,000 acre-feet of water in the year 1943 and again in the year 1944.

So, remembering now the history of this initial development and the fight made

against Arizona for the use of any water in the main stream [and that fight by the way, if I can read the signs right, will be made against every other project in the Colorado River Basin, in whatever State located] we went to work.

It has been intimated here that the Mexican Treaty was negotiated behind California's back.

When I got back into this picture early in 1943, the first meeting I attended was here in Washington with the then legal adviser of the State Department and the legal advisers of all the other States, at which California was very well represented. I am informed that even before that, since about 1937, the danger of the loss forever by use in Mexico had been rather generally recognized in the Colorado River Basin and there had been many repeated earlier meetings considering the question of Mexico's claims to the water of the Colorado River, and from the first meeting I attended early in 1943 the California representatives were present at every meeting at which I was present in the discussion of this river until, through the committee of 16, we reached the parting of the ways—California opposing the treaty; Colorado, Utah, Wyoming, New Mexico, and Arizona supporting the treaty because of the benefit to the United States, as we saw it, in having an over-all, all-time limit on Mexico's claim of right to the water of the river which was being rapidly increased. California opposed it. Nevada at that time passed, at that meeting at which a formula was adopted, and later came to the support of California in opposing the treaty.

Mr. Dowd made one statement with which I wish to take direct issue. If I understood him correctly, he said, while the State of Arizona supported the treaty that, without exception, all users of water in Arizona joined with California in opposing it.

Mr. PHILLIPS. I do not think he said all of them.

Mr. CARSON. Was not that your statement?

Mr. DOWD. No; I said the Salt River Valley Water Users' Association, which is the largest irrigation district in Arizona, and projects using water around Florence and San Carlos, and the largest users of water in the Yuma Valley and other similar organizations, not only supported California and Nevada but had representatives in Washington who appeared against the treaty.

Mr. CARSON. I still want to take direct exception. It reminds me of the story of the three tailors of Threadneedle Street—"We, the people of England." What actually happened was that California organized a meeting which had for its purpose objecting to this treaty and invited a few people from Arizona and other States out there. I imagine there were not very many from Arizona. But actually this whole treaty matter was explained in detail to the Legislature of the State of Arizona, which represents all of the farmers of the State and includes, among its membership, members of the boards of directors of some of these various organizations, and in the Legislature of Arizona they passed a memorial urging the ratification of the treaty—the senate unanimously, and the house of representatives by 48 to 1. And the people who met in Las Vegas, as I understand it, were called up there, and there had been no previous instruction to them by their organizations in opposition to the treaty and they fell under the very persuasive power of Mr. Dowd and Mr. Northcutt Ely, or whoever was there.

Mr. ELY. Since my name has been mentioned, may I say the board of governors of the Salt River Valley water users went on record as opposing the treaty, and later proposed reservations to the treaty which I suggest be incorporated in the hearings at this point—their resolution and their proposed reservations to the treaty as presented by the members of the boards of governors and the chief counsel at the hearing on the treaty before the Foreign Relations Committee of the United States Senate.

Chairman MURDOCK. The 16-page booklet offered as evidence is too long to interject here. The resolution on page 16 will suffice at this point and the entire document may appear later. Was that prior or subsequent to the meeting in Las Vegas?

Mr. ELY. The resolution of the board of governors approved the action taken by four members of the board at Las Vegas, and ratified it with proposed reservations to the treaty.

"RESOLUTION

"Whereas this board of governors of Salt River Valley Water Users' Association authorized the following of its members:

"V. I. Corbell, J. A. Sinnott, H. C. Dobson, and J. H. Evans to represent the said association at the meeting held in Las Vegas, Nev., on January 12 and 13,

1945, in opposition to the proposed treaty with Mexico relating to the allocation of the waters of the Colorado River; and

"Whereas there was adopted at said Las Vegas meeting a resolution in opposition to the proposed treaty with Mexico, which said resolution was supported by the aforesaid members of this board of governors: Therefore be it

"*Resolved*, That the action of the aforesaid members of this board of governors in voting at the Las Vegas meeting for the adoption of the resolution in opposition to the proposed treaty with Mexico be, and it hereby is, declared ratified.

* * * * * * *

"CERTIFICATE

"I, F. C. Henshaw, the duly appointed and acting secretary of the Salt River Valley Water Users' Association, hereby certify that the above and foregoing is a true, correct, and complete copy of a resolution duly adopted at a meeting of the board of governors of said association duly and regularly held on the 5th day of February 1945, at which said meeting a quorum was present.

"[SEAL] F. C. HENSHAW, *Secretary*."

Chairman MURDOCK. The Chair holds the entire 16-page booklet pertaining to this discussion but directs that it appear in an appendix at the end of the published hearings. (See pp. 763–769.) Only the closing resolution on page 16 is necessary at this point.

Mr. CARSON. That was later. But at that time you were employed, were you not, by the State of California?

Mr. ELY. Yes. Mr. Chairman, do you wish to go into that? I shall be very happy at the appropriate time, if you wish, to do so.

Mr. WHITE. Could not you give a simple answer to a simple question?

Mr. ELY. What is the question?

Mr. WHITE. Whether at that time you were employed—yes or no?

Mr. ELY. I was employed by the department of water and power of the city of Los Angeles and had been for many years as both clients of course knew. If the committee desires me to go into that question, I will be very happy to do so. I represented then, and now, the California Water Project Authority in Central Valley, and now represent the Colorado River Board of California.

Mr. WHITE. I do not think that calls for anything but a yes or no answer to the question.

Chairman MURDOCK. Yes; that is properly and adequately answered.

Mr. CARSON. But they did fall under the persuasive power and influence of the representatives of California at that meeting—those few individuals.

Now, to go back again to the construction of this contract, article III of the Colorado River compact under the Boulder Canyon Project Act, as to III (b) water the Department of the Interior, in regulations approved by the then Secretary of the Interior, Ray Lyman Wilbur, promulgated regulations offering a contract to the State of Arizona for 2,800,000 acre-feet annually from the main stream of the Colorado River.

Chairman MURDOCK. When was that?

Mr. CARSON. In 1933. The regulation was dated February 7, 1933. The proposal was brought to Phoenix, as I understand it—and again I want to be corrected if I am incorrect—by Mr. Ely, who was then an Assistant Secretary; but it was brought out there right in the last days of February 1933, before the change of administration which was occurring on March 4 following; so that the negotiations were not concluded and the contract was not at that time signed. But it is significant in this, that in the proposed contract, in the regulations of the Secretary, the water to be delivered was described as follows:

"Ten. From storage available in the reservoir created by Hoover Dam, the United States will deliver under this contract each year, at points of diversion hereinafter referred to on the Colorado River, so much of the available water as may be necessary to enable the beneficial consumptive use in Arizona of not to exceed 2,800,000 acre-feet annually by all diversions effected from the Colorado River and its tributaries below Lee Ferry; but in addition to all uses of waters from the Gila River and its tributaries—"

Also article 15 (a) provided—

"The State of Arizona will hereafter grant no permits for, nor otherwise authorize, uses of the waters of the Colorado River and its tributaries other than the Gila River and its tributaries, except subject to the terms of this contract."

Now, this was offered at a time when Arizona had not ratified the Colorado River compact and this did not contemplate that it would; so that there can be no question on that.

Mr. FERNANDEZ. This was offered as an administrative interpretation of the act?

Mr. CARSON. Yes; by the Bureau of Reclamation and the Interior Department at that time. Then, as the years passed and this increase in the use in Mexico became so apparent to us in Arizona, we again became very much concerned about any possible water from Arizona from the main stream of the Colorado River in view of those developments; so, again, the legislature passed an act, in view of the failure of California to agree, authorizing the negotiation of a contract with the Secretary of the Interior for 2,800,000 acre-feet of main stream water and agreed when that was done Arizona would ratify the Colorado River compact, and we went into lengthly negotiations upon a contract. And whereas California representatives had formerly based their main opposition, as I understood it, on the fact Arizona had not ratified the Colorado River compact, they opposed the recent effort to get a contract, even though it contained a provision that it should not become effective unless and until Arizona ratified the compact. At the same time, that effort to negotiate a contract had not been made by me until after I had attended this State Department conference with the legal adviser, when all of this treaty matter had come up and it became apparent that, for the benefit of the United States, it was necessary that the treaty be made. And I told them at that meeting, before we adjourned that day, that in my judgment Arizona must now proceed to get a contract, and we wanted it to be effective in advance of the Mexican treaty; because we did not want this group of California men to continue to block developments in Arizona and for them to be able to say "Too bad, Arizona, but that is your water that is going to Mexico" either under or without a treaty. And that has been our whole position.

We started then, in 1943, and on February 9, 1944, we secured a contract from the United States, acting through the Secretary of the Interior, for 2,800,000 acre-feet of main stream water.

Mr. PHILLIPS. When you say "contract," what was the form of it?

Mr. CARSON. I will put a copy in the record, if I may. I do not think it is necessary for me to read it all, but I will put a copy in the record; but the provisions as to the water supply I would like to read.

Chairman MURDOCK. Without objection, it will be admitted to the record at this point.

Mr. CARSON. This is headed "Delivery of water."

"7. (a) Subject to the availability thereof for use in Arizona under the provisions of the Colorado River compact and the Boulder Canyon Project Act, the United States shall deliver and Arizona, or agencies or water users therein, will accept under this contract each calendar year from storage in Lake Mead, at a point or points of diversion on the Colorado River approved by the Secretary, so much water as may be necessary for the beneficial consumptive use for irrigation and domestic uses in Arizona of a maximum of 2,800,000 acre-feet.

"(b) * * * The United States also shall deliver from storage in Lake Mead for use in Arizona, at a point or points of diversion on the Colorado River approved by the Secretary, for the uses set forth in subdivision (a) of this article, one-half of any excess or surplus waters unapportioned by the Colorado River compact to the extent such water is available for use in Arizona under said compact and said act, less such excess or surplus water unapportioned by said compacts as may be used in Nevada, New Mexico, and Utah in accordance with the rights of said States as stated in subdivisions (f) and (g) of this article.

* * * * * * *

"(d) The obligation to deliver water at or below Boulder Dam shall be diminished to the extent that consumptive uses now or hereafter existing in Arizona above Lake Mead diminish the flow into Lake Mead, and such obligation shall be subject to such reduction on account of evaporation, reservoir and river losses, as may be required to render this contract in conformity with said compact and said act.

"(e) This contract is for permanent service, subject to the conditions stated in subdivision (c) of this article, but as to the one-half of the waters of the Colorado River system unapportioned by paragraphs (a), (b), and (c) of article III of the Colorado River compact, such water is subject to further equitable apportionment at any time after October 1, 1963, as provided in article III (f) and articles III (g) of the Colorado River compact."

Those are the things I want particularly to emphasize:

"(f) Arizona recognizes the right of the United States and the State of Nevada to contract for the delivery from storage in Lake Mead for annual beneficial consumptive use within Nevada for agricultural and domestic uses of 300,000 acre-feet of the water apportioned to the lower basin by the Colorado River compact, and in addition thereto to make contract for like use of one twenty-fifth of any excess or surplus waters available in the lower basin and unapportioned by the Colorado River compact, which waters are subject to further equitable apportionment after October 1, 1963, as provided in article III (f) and article III (g) of the Colorado River compact.

"(g) Arizona recognizes the rights of New Mexico and Utah to equitable shares of the water apportioned by the Colorado River compact to the lower basin and also water unapportioned by such compact, and nothing contained in this contract shall prejudice such rights.

"(h) Arizona recognizes the right of the United States and agencies of the State of California to contract for storage and delivery of water from Lake Mead for beneficial consumptive use in California, provided that the aggregate of all such deliveries and uses in California from the Colorado River shall not exceed the limitation of such uses in that State required by the provisions of the Boulder Canyon Project Act and agreed to by the State of California by an act of its legislature (ch. 16, Statutes of California of 1929) upon which limitation the State of Arizona expressly relies."

(The contract above referred to is, in full, as follows:)

"UNITED STATES DEPARTMENT OF THE INTERIOR, BUREAU OF RECLAMATION—BOULDER CANYON PROJECT, ARIZONA-CALIFORNIA-NEVADA

"CONTRACT FOR DELIVERY OF WATER

"THIS CONTRACT made this 9th day of February 1944, pursuant to the Act of Congress approved June 17, 1902 (32 Stat. 388), and acts amendatory thereof or supplemental thereto, all of which acts are commonly known and referred to as the Reclamation Law, and particularly pursuant to to the Act of Congress approved December 21, 1928 (45 Stat. 1057), designed the Boulder Canyon Project Act, and acts amendatory thereof or supplementary thereto, between THE UNITED STATES OF AMERICA, hereinafter referred to as "United States," acting for this purpose by Harold L. Ickes, Secretary of the Interior, hereinafter referred to as the "Secretary," and the STATE OF ARIZONA, hereinafter referred to as "Arizona," acting for this purpose by the Colorado River Commission of Arizona, pursuant to Chapter 46 of the 1939 Session Laws of Arizona,

"WITNESSETH THAT—

"EXPLANATORY RECITALS

"2. WHEREAS for the purpose of controlling floods, improving navigation, regulating the flow of the Colorado River, providing for storage and for the delivery of stored waters for the reclamation of public lands and other beneficial uses exclusively within the United States, the Secretary acting under and in pursuance of the provisions of the Colorado River Compact and Boulder Canyon Project Act, and acts amendatory thereof or supplementary thereto, has constructed and is now operating and maintaining in the main stream of the Colorado River at Black Canyon that certain structure known as and designated Boulder Dam and incidental works, creating thereby a reservoir designated Lake Mead of a capacity of about thirty-two million (32,000,000) acre-feet; and

"3. WHEREAS said Boulder Canyon Project Act provides that the Secretary under such general rules and regulations, as he may prescribe, may contract for the storage of water in the reservoir created by Boulder Dam, and for the delivery of such water at such points on the river as may be agreed upon, for irrigation and domestic uses, and provides further that no person shall have or be entitled to have the use for any purpose of the water stored, as aforesaid, except by contract made as stated in said Act, and

"4. WHEREAS it is the desire of the parties to this contract to contract for the storage of water and the delivery thereof for irrigation of lands and domestic uses within Arizona, and

"5. WHEREAS nothing in this contract shall be construed as affecting the obligations of the United States to Indian tribes,

"6. NOW, THEREFORE, in consideration of the mutual covenants herein contained, the parties hereto agree as follows, to wit:

"DELIVERY OF WATER

"7. (a) Subject to the availability thereof for use in Arizona under the provisions of the Colorado River Compact and the Boulder Canyon Project Act, the United States shall deliver and Arizona, or agencies or water users therein will accept under this contract each calendar year for storage in Lake Mead, at a point or points of diversion on the Colorado River approved by the Secretary, so much water as may be necessary for the beneficial consumptive use for irrigation and domestic uses in Arizona of a maximum of 2,800,000 acre-feet.

"(b) The United States also shall deliver from storage in Lake Mead for use in Arizona, at a point or points of diversion on the Colorado River approved by the Secretary, for the uses set forth in subdivision (a) of this article, one-half of any excess or surplus waters unapportioned by the Colorado River compact to the extent such water is available for use in Arizona under said compact and said act, less such excess or surplus water unapportioned by said compact as may be used in Nevada, New Mexico, and Utah in accordance with the rights of said States as stated in subdivisions (f) and (g) of this article.

"(c) This contract is subject to the condition that Boulder Dam and Lake Mead shall be used: First, for river regulation, improvement of navigation, and flood control; second, for irrigation and domestic uses and satisfaction of perfected rights in pursuance of article VIII of the Colorado River compact; and third, for power. This contract is made upon the express condition and with the express covenant that the United States and Arizona, and agencies and water users therein, shall observe and be subject to and controlled by said Colorado River compact and the Boulder Canyon Project Act in the construction, management, and operation of Boulder Dam, Lake Mead, canals and other works, and the storage, diversion, delivery, and use of water for the generation of power, irrigation, and other uses.

"(d) The obligation to deliver water at or below Boulder Dam shall be diminished to the extent that consumptive uses now or hereafter existing in Arizona above Lake Mead diminish the flow into Lake Mead, and such obligation shall be subject to such reduction on account of evaporation, reservoir and river losses, as may be required to render this contract in conformity with said compact and said Act.

"(e) This contract is for permanent service, subject to the conditions stated in subdivision (c) of this article, but as to the one-half of the waters of the Colorado River system unapportioned by paragraphs (a), (b), and (c) of article III of the Colorado River compact, such water is subject to further equitable apportionment at any time after October 1, 1963, as provided in article III (f) and article III (g) of the Colorado River compact.

"(f) Arizona recognizes the right of the United States and the State of Nevada to contract for the delivery from storage in Lake Mead for annual beneficial consumptive use within Nevada for agricultural and domestic uses of 300,000 acre-feet of the water apportioned to the lower basin by the Colorado River compact, and in addition thereto to make contract for like use of 1/25 (one twenty-fifth) of any excess or surplus waters available in the lower basin and unapportioned by the Colorado River compact, which waters are subject to further equitable apportionment after October 1, 1963, as provided in article III (f) and article III (g) of the Colorado River compact.

"(g) Arizona recognizes the rights of New Mexico and Utah to equitable share of the water apportioned by the Colorado River Compact to the Lower Basin and also water unapportioned by such compact, and nothing contained in this contract shall prejudice such rights.

"(h) Arizona recognizes the right of the United States and agencies of the State of California to contract for storage and delivery of water from Lake Mead for beneficial consumptive use in California, provided that the aggregate of all such deliveries and uses in California from the Colorado River shall not exceed the limitation of such uses in that State required by the provisions of the Boulder Canyon Project Act and agreed to by the State of California by an act of its Legislature (Chapter 16, Statutes of California of 1929) upon which limitation the State of Arizona expressly relies.

"(i) Nothing in this contract shall preclude the parties hereto from contracting for storage and delivery above Lake Mead of water herein contracted for, when and if authorized by law.

"(j) As far as reasonable diligence will permit, the water provided for in this contract shall be delivered as ordered and as reasonably required for domestic

and irrigation uses within Arizona. The United States reserves the right to discontinue or temporarily reduce the amount of water to be delivered for the purpose of investigation and inspection, maintenance, repairs, replacements, or installation of equipment or machinery at Boulder Dam, or other dams heretofore or hereafter to be constructed, but so far as feasible will give reasonable notice in advance of such temporary discontinuance or reduction.

"(k) The United States, its officers, agents, and employees shall not be liable for damages when for any reason whatsoever suspensions or reductions in the delivery of water occur.

"(l) Deliveries of water hereunder shall be made for use within Arizona to such individuals, irrigation districts, corporations, or political subdivisions therein of Arizona as may contract therefor with the Secretary, and as may qualify under the Reclamation Law or other Federal statutes or to lands of the United States within Arizona. All consumptive uses of water by users in Arizona, of water diverted from Lake Mead or from the main stream of the Colorado River below Boulder Dam, whether made under this contract or not, shall be deemed, when made, a discharge pro tanto of the obligation of this contract. Present perfected rights to the beneficial use of waters of the Colorado River system are unimpaired by this contract.

"(m) Rights-of-way across public lands necessary or convenient for canals to facilitate the full utilization in Arizona of the water herein agreed to be delivered will be granted by the Secretary subject to applicable Federal statutes.

"POINTS OF DIVERSION; MEASUREMENTS OF WATER

"8. The water to be delivered under this contract shall be measured at the points of diversion, or elsewhere as the Secretary may designate (with suitable adjustment for losses between said points of diversion and measurement), by measuring and controlling devices or automatic gauges approved by the Secretary, which devices, however, shall be furnished, installed, and maintained by Arizona or the users of water therein in manner satisfactory to the Secretary; said measuring and controlling devices or automatic gauges shall be subject to the inspection of the United States, whose authorized representatives may at all times have access to them, and any deficiencies found shall be promptly corrected by the users thereof. The United States shall be under obligation to deliver water only at diversion points where measuring and controlling devices or automatic gauges are maintained, in accordance with this contract, but in the event diversions are made at points where such devices are not maintained, the Secretary shall estimate the quantity of such diversions and his determination thereof shall be final.

"CHARGES FOR STORAGE AND DELIVERY OF WATER

"9. No charge shall be made for the storage or delivery of water at diversion points as herein provided necessary to supply present perfected rights in Arizona. A charge of 50¢ per acre-foot shall be made for all water actually diverted directly from Lake Mead during the Boulder Dam cost-repayment period, which said charge shall be paid by the users of such water, subject to reduction by the Secretary in the amount of the charge if it is concluded by him at any time during said cost-repayment period that such charge is too high. After expiration of the cost-repayment period, charges shall be on such basis as may hereafter be prescribed by Congress. Charges for the storage or delivery of water diverted at a point or points below Boulder Dam, for users, other than those specified above, shall be as agreed upon between the Secretary and such users at the time of execution of contracts therefor, and shall be paid by such users; provided such charges shall, in no event, exceed 25¢ per acre-foot.

"RESERVATIONS

"10. Neither Article 7, nor any other provision of this contract, shall impair the right of Arizona and other States and the users of water therein to maintain, prosecute, or defend any action respecting, and is without prejudice to, any of the respective contentions of said States and water users as to (1) the intent, effect, meaning, and interpretation of said compact and said act; (2) what part, if any, of the water used or contracted for by any of them falls within Article III (a) of the Colorado River Compact; (3) what part, if any, is within Article III (b) thereof; (4) what part, if any, is excess or surplus waters unappor-

tioned by said Compact; and (5) what limitations on use, rights of use, and relative priorities exist as to the waters of the Colorado River system; provided, however, that by these reservations there is no intent to disturb the apportionment made by Article III (a) of the Colorado River Compact between the Upper Basin and the Lower Basin.

"DISPUTES AND DISAGREEMENTS

"11. Whenever a controversy arises out of this contract, and if the parties hereto then agree to submit the matter to arbitration, Arizona shall name one arbitrator and the Secretary shall name one arbitrator and the two arbitrators thus chosen shall meet within ten days after their selection and shall elect one other arbitrator within fifteen days after their first meeting, but in the event of their failure to name the third arbitrator within thirty days after their first meeting, such arbitrator not so selected shall be named by the Senior Judge of the United States Circuit Court of Appeals for the Tenth Circuit. The decision of any two of the three arbitrators thus chosen shall be a valid and binding award.

"RULES AND REGULATIONS

"12. The Secretary may prescribe and enforce rules and regulations governing the delivery and diversion of waters hereunder, but such rules and regulations shall be promulgated, modified, revised, or extended from time to time only after notice to the State of Arizona and opportunity is given to it to be heard. Arizona agrees for itself, its agencies and water users that in the operation and maintenance of the works for diversion and use of the water to be delivered hereunder, all such rules and regulations will be fully adhered to.

"AGREEMENT SUBJECT TO COLORADO RIVER COMPACT

"13. This contract is made upon the express condition and with the express covenant that all rights of Arizona, its agencies and water users, to waters of the Colorado River and its tributaries, and the use of the same, shall be subject to and controlled by the Colorado River Compact signed at Santa Fe, New Mexico, November 24, 1922, pursuant to the Act of Congress approved August 19, 1921 (42 Stat. 171), as approved by the Boulder Canyon Project Act.

"EFFECTIVE DATE OF CONTRACT

"14. This contract shall be of no effect unless it is unconditionally ratified by an Act of the Legislature of Arizona, within three years from the date hereof, and further, unless within three years from the date hereof the Colorado River Compact is unconditionally ratified by Arizona. When both ratifications are effective, this contract shall be effective.

"INTEREST IN CONTRACT NOT TRANSFERABLE

"15. No interest in or under this contract, except as provided by Article 7 (1), shall be transferable by either party without the written consent of the other.

"APPROPRIATION CLAUSE

"16. The performance of this contract by the United States is contingent upon Congress making the necessary appropriations for expenditures for the completion and the operation and maintenance of any dams, power plants or other works necessary to the carrying out of this contract, or upon the necessary allotments being made therefor by any authorized Federal agency. No liability shall accrue against the United States, its officers, agents, or employees by reason of the failure of Congress to make any such appropriations or of any Federal agency to make such allotments.

"MEMBER OF CONGRESS CLAUSE

"17. No Member of or Delegate to Congress or Resident Commissioner shall be admitted to any share or part of this contract or to any benefit that may arise herefrom, but this restriction shall not be construed to extend to this contract if made with a corporation or company for its general benefit.

"DEFINITIONS

"18. Wherever terms herein are defined in Article II of the Colorado River Compact or in Section 12 of the Boulder Canyon Project Act, such definitions shall apply in construing this contract.

"19. IN WITNESS WHEREOF the parties hereto have caused this contract to be executed the day and year first above written.

"THE UNITED STATES OF AMERICA,
"By (Signed) HAROLD L. ICKES,
Secretary of the Interior.
"STATE OF ARIZONA, acting by and through its COLORADO RIVER COMMISSION,
"By (Signed) HENRY S. WRIGHT, *Chairman,*
"By (Signed) NELLIE T. BUSH, *Secretary.*

"Approved this 7th day of February 1944.
"(Signed) SIDNEY P. OSBORN, *Governor of the State of Arizona.*"

Mr. WHITE. Mr. Chairman, a parliamentary inquiry? I would ?
State of Arizona, signed on behalf of the United States on the 7th day ?
made by whom; what the agreement is, and by whom it was made?

Chairman MURDOCK. Mr. Carson, will identify it?

Mr. CARSON. This is a contract between the United States and the State of Arizona, signed on behalf of the United States on the 7th day of February 1944, by Harold L. Ickes, Secretary of the Interior, and signed on behalf of the State of Arizona by its Colorado River Commission, by Henry S. Wright, chairman, and Nellie T. Bush, secretary, and by Sidney P. Osborn, Governor of the State of Arizona. I might add that this contract required ratification by the Arizona Legislature, and it was ratified before the end of February 1944, and the Colorado River compact was also ratified before the end of February 1944.

Mr. WHITE. Did such a contract by the Secretary of the Interior require the ratification by the Congress?

Mr. CARSON. No, sir.

Mr. PHILLIPS. The other day Mr. White asked, and I am a little confused at this point, about the right of the Secretary of the Interior to apportion the waters of the Colorado, and it seemed to me the answer was "No." I am not questioning it; I just do not understand how he can apportion the water. I think the answer to Mr. White's question the other day was, it had to be an agreement between the three lower basin States.

Chairman MURDOCK. As I understand this apportionment, if it can be called that, is under the law; it is in conformity with the act of 1928, the Boulder Canyon Project Act. I think that probably is the Secretary's authority for entering into such a contract.

Mr. PHILLIPS. Well, Mr. Carson, did not the Secretary, in the statement you just read or the agreement you just read, say something about the quality of the water?

Mr. CARSON. No, sir; none of them, so far as I know, say anything about the quality of the water.

Mr. PHILLIPS. Was not there a memorandum, then, from the Secretary which accompanied it at the same time and, to all intents and purposes became a part of it, that should be put in the record right here, which might be called an explanatory memorandum regarding this contract you have just read?

Mr. CARSON. Not so far as I know. This is the entire contract between the United States and the State of Arizona.

Mr. PHILLIPS. I think there is a memorandum, Mr. Chairman; and, if there is such, I think we ought to put it in at this point, so that it can be read in connection with this contract.

Chairman MURDOCK. If there is such a memorandum from the Secretary of the Interior, it may be incorporated.

Mr. CARSON. There is a provision here that we all have to comply with, including California.

Mr. PHILLIPS. If I may pursue that, I think maybe I was wrong in my question. I think what I had in mind was the reference to whether it was III (a) or III (b) water, and I think the Secretary did say something about that.

Mr. CARSON. No. It does not specify.

Mr. PHILLIPS. It does not say definitely, but does not he specify that he cannot decide that?

Mr. WHITE. Let us turn back to III (a) and III (b). I distinctly remember three different references to the contract referred to in the agreement.

Mr. CARSON. No; not in the water to be supplied to us.

Mr. WHITE. I mean in the document you read there.

Mr. CARSON. Let me say that it is not Arizona's contention that by this contract the Department of the Interior has undertaken to settle any dispute between Arizona and California. They felt they should not do that.

Mr. WHITE. Read that language you read before.

Mr. CARSON. Let me go back here for a minute to Mr. Phillips' prior question. The Boulder Canyon Project Act provides that contracts respecting water for irrigation and domestic uses shall be for permanent service and shall conform to paragraph (a) of section 4 of this act "that no person shall have or be entitled to have the use for any purpose of the water stored as aforesaid, except by contract made as hereinafter stated."

And the claim of right by every California agency to the water from Lake Mead is based upon contracts with the Secretary of the Interior, as is our right, and on that basis they are all in an equal status.

Chairman MURDOCK. Are those firm contracts?

Mr. CARSON. No, sir; they are just exactly the same as ours are. I will refer to that question in a minute. They are not firm contracts, and there is no firm commitment on the part of the United States to deliver any specified quantity of water to California. It is always subject to its availability for use in California, under the Colorado River compact and the Boulder Canyon Project Act.

Mr. PHILLIPS. I think maybe Mr. White has asked a very important question there. I have the memorandum I referred to in my hand.

Mr. CARSON. What was that—a press release or something?

Mr. PHILLIPS. Yes; a press release which accompanied the memorandum. This press release had three paragraphs and then contained in full the memorandum of February 2; but evidently there was some question of authority which Mr. White asked about. Is not there something in the contract where he reserves to the States the right to contract?

Mr. CARSON. Oh, surely; but he does not undertake to settle these questions. But let me go back to what I said. I did not undertake to say that by this contract the Department of the Interior has agreed to deliver to Arizona or specifically named III (a) water. They do not name III (a) water, but they do provide that this water is to be delivered from Lake Mead. That is the only authority that the Secretary has, as I understand it, to make contracts for the water of the Colorado River, that water which can be stored in Lake Mead created by Boulder Dam. I want to call your attention to the location again on that. Here [indicating] is Boulder Dam away up here. Now, the way we construe all of these documents and statutes and contracts is that the upper basin States are required to deliver at Lee Ferry an average of 7,500,000 acre-feet each year. That water comes on down and is augmented by the Little Colorado River out of Arizona and some small streams out of northern Arizona and one, I believe, going into Utah until it reaches Boulder Dam where it is there stored.

Now, the Secretary's authority to make contracts for the delivery of water is limited to water stored behind Boulder Dam or as may be later stored by any dam authorized by Congress. Generally speaking, I will agree that the Secretary of the Interior does not own the water of the Colorado River; that it is owned by the States and is subject to appropriation in accordance with their respective laws, and in the Colorado River Basin all of us have the right of prior appropriation. But under the act of Congress which I have read, the Secretary is authorized to make contracts for the delivery of water stored in Lake Mead, and that is what our contract provides—that from the water stored in Lake Mead, which is up here [indicating], the Secretary shall deliver so much water as may be necessary for the beneficial consumptive use for irrigation and domestic uses in Arizona of a maximum of 2,800,000 acre-feet; again, however, subject to its availability for use in Arizona under the provisions of the compact and the Boulder Canyon Project Act. So that clearly excludes from this contract any part of the Gila River water and relates to water that is delivered at Lee Ferry, which is subject to all of those applications.

Chairman MURDOCK. You could not call that a firm contract, then?

Mr. CARSON. No, sir; we do not. It is a contract for delivery in Arizona of a quantity of water, subject to its availability, for use in Arizona under the compact and the act.

91190—49—ser. 11, pt. 1——20

Chairman MURDOCK. But you do assert that it is on a par with all other contracts of such a character?

Mr. CARSON. Yes.

Mr. WHITE. I wonder if the witness could not proceed down to where the three provisions were mentioned, the B and A were mentioned in the contract. I would like to get that in the record. That was in the contract.

Mr. CARSON. I think, Mr. White, that what I was referring to in this contract was the provisions of paragraph 7 and in this paragraph the language is also divided into A and B. But I will also refer to the part that concerns the reservations.

Mr. WHITE. The gentleman from California asked the question.

Mr. CARSON. Yes. This is one of the reservations that I think you wanted brought out.

Paragraph 10 of this Arizona contract reads:

"Neither article seven, nor any other provision of this contract, shall impair the right of Arizona and other States and the users of water therein to maintain, prosecute, or defend any action respecting, and is without prejudice to, any of the respective contentions of said states and water users as to (1) The intent, effect, meaning, and interpretation of said compact and said act; (2) what part, if any, of the water used or contracted for by any of them falls within article III (a) of the Colorado River Compact; (3) what part, if any, is within article III (b) thereof; (b) what part, if any, is excess or surplus waters unapportioned by said compact; and (5) what limitations on use, rights of use, and relative priorities exist as to the waters of the Colorado River system; provided, however, that by these reservations there is no intent to disturb the apportionment made by Article III (a) of the Colorado River Compact between the Upper Basin and the Lower Basin."

Chairman MURDOCK. In other words, that simply means the contract is made subject to the Boulder Canyon Project Act.

Mr. CARSON. Yes; and the Colorado River compact.

Chairman MURDOCK. Exactly.

Mr. FERNANDEZ. Mr. Chairman, since the contract is in evidence in aid to a proper understanding of the Boulder Canyon Act and its interpretation by the Department, should we not also have whatever is contained in the press release, as a part of the record?

Chairman MURDOCK. I think that is pertinent.

Mr. PHILLIPS. I think it would be helpful if we did put in this Bureau of Reclamation release of February 10, 1944, and following the three preliminary paragraphs is found the statement that Secretary Ickes issued the following memorandum, and this is the paragraph I had in mind, and I quote:

"I have considered carefully the objections made by California in its printed brief and at the hearing before me on February 2. California is fearful that subdivisions (a) and (b) of article 7 construed together create an inference that a maximum of 2,800,000 acre-feet which the United States agrees to deliver under subdivision (a) is water apportioned to the lower basin under article III (a) of the compact and that Arizona could contend, to California's prejudice, that this constituted an administrative determination that Arizona was entitled by this contract to 2,800,000 acre-feet of III (a) water. I am convinced that California's fears in this respect are unfounded for at least two reasons. First, I wish to make it clear and to emphasize that the delivery of water under both subdivision (a) and subdivision (b) of article 7 is expressly 'subject to its availability under the Colorado River compact and the Boulder Canyon Project Act.' The proposed contract does not attempt to obligate the United States to deliver any water to Arizona which is not available to Arizona under the terms of the compact and act. Secondly, article 10 was purposely designed to prevent Arizona, or any other State, from contending that the proposed contract, or any provision of the proposed contract, resolves any issue on the amounts of water which are apportioned or unapportioned by the compact and the amounts of apportioned or unapportioned water available to the respective States under the compact and the act. It expressly reserves for future judicial determination any issue involving the intent, effect, meaning, and interpretation of the compact and act. The language of article 10 is plain and unequivocal and adequately reserves all questions of interpretation of the compact and the act."

In other words, that just says again that this committee cannot determine the allocation of the water.

Mr. CARSON. I am not asking the committee to determine the allocation of the water, and I will make that clear before I have finished.

Mr. WHITE. Why not have the entire memorandum made a part of the record.

Chairman MURDOCK. You wish the entire memorandum in the record?

Mr. PHILLIPS. I think that will be all right. I only read the one paragraph. And I did not read the entire release.

(The statement referred to follows:)

"DEPARTMENT OF THE INTERIOR—INFORMATION SERVICE—BUREAU OF RECLAMATION

"For immediate release Thursday, February 10, 1944 W

"Secretary of the Interior Harold L. Ickes announced today he had signed, on behalf of the United States, a contract to deliver to the State of Arizona annually 2,800,000 acre-feet of Colorado River water from storage in the Bureau of Reclamation's Boulder Dam Reservoir, subject to its availability for use in Arizona under the provisions of the Colorado River compact and the Boulder Canyon Project Act.

"Commissioner of Reclamation Harry W. Bashore said the contract would become effective when ratified by the Arizona Legislature and when this body unconditionally ratifies the Colorado River compact. The legislature, on March 25, 1943, voted to ratify the compact, provided a contract for the delivery of water from Lake Mead was executed between the United States and Arizona.

"The Secretary signed the contract after considering fully the objections presented by the State of California in a hearing on February 2 and representations made by the State of Arizona in reply. The contract had previously been approved by the committee of fourteen, which is composed of two representatives of each of the seven Colorado River Basin States. All members of the committee except those from California approved the agreement which the Secretary has now signed.

"In announcing his decision, Secretary Ickes issued the following memorandum:

"Memorandum re hearing February 2 on California's objections to the proposed contract between the United States and Arizona for the delivery of water from Lake Mead

"There has been submitted to me for approval and execution a proposed contract between the United States and the State of Arizona for the delivery of water from Lake Mead for use in Arizona. Section 5 of the Boulder Canyon Project Act authorizes me to contract for the storage and delivery of water impounded by Boulder Dam. Under subdivision (a) of article 7 of the proposed contract the United States agrees to deliver annually from storage in Lake Mead for use in Arizona a maximum of 2,800,000 acre-feet of water, subject to its availability for use in Arizona under the provisions of the Colorado River compact and the Boulder Canyon Project Act, and under subdivision (b) of article 7 the United States agrees to deliver one-half of any excess or surplus water unapportioned by the compact to the extent such water is available for use in Arizona under the compact and act. The contract is conditioned upon the unconditional ratification of the compact by Arizona.

"'The proposed contract was drafted by the committee of fourteen after the Arizona Legislature last spring passed an act contingently ratifying the compact—the contingency being the execution and ratification by the legislature of a contract for the delivery of water from Lake Mead. Representatives of the Bureau of Reclamation worked closely with the committee and made a number of modifications which were accepted by the committee and Arizona. Bureau representatives, under my instructions, have taken the position throughout the negotiations that any contract proposed should not commit the Department as to any controversial issue regarding the amounts of water available to Arizona, or to any compact State, under the compact and the act. The proposed contract has been approved by the representatives of each of the Colorado River States, except California.

"'I have considered carefully the objections made by California in its printed brief and at the hearing before me on February 2. California is fearful that subdivisions (a) and (b) of article 7 construed together create an inference that the maximum of 2,800,000 acre-feet which the United States agrees to deliver under subdivision (a) is water apportioned to the lower basin under article III (a) of the compact and that Arizona could contend, to California's prejudice, that this constituted an administrative determination that Arizona was entitled by this contract to 2,800,000 acre-feet of III (a) water. I am convinced that

California's fears in this respect are unfounded for at least two reasons. First, I wish to make it clear, and to emphasize, that the delivery of water under both subdivision (a) and subdivision (b) of article 7 is expressly "subject to its availability under the Colorado River compact and the Boulder Canyon Project Act." The proposed contract does not attempt to obligate the United States to delivery any water to Arizona which is not available to Arizona under the terms of the compact and act. Secondly, article 10 was purposely designed to prevent Arizona, or any other State, from contending that the proposed contract, or any provision of the proposed contract, resolves any issue on the amounts of waters which are apportioned or unapportioned by the compact and the amounts of apportioned or unapportioned water available to the respective States under the compact and the act. It expressly reserves for future judicial determination any issue involving the intent, effect, meaning, and interpretation of the compact and act. The language of article 10 is plain and unequivocal and adequately reserves all questions of interpretation of the compact and the act.

" 'It is my opinion that I have authority under section 5 of the act to execute such a contract as is proposed to be made with Arizona. The Department has made contracts with California and Nevada for the delivery of waters from Lake Mead subject to its availability under the compact and act. Now that Arizona has agreed to ratify the compact, it is my opinion that Arizona is entitled to be accorded the same consideration that the Department has accorded to California and Nevada. Accordingly, I have decided to approve and execute the proposed contract with Arizona.

" 'HAROLD L. ICKES,
" '*Secretary of the Interior.*

" 'FEBRUARY 9, 1944.' "

"California and Arizona have been at odds for more than 20 years over the division of the waters of the Colorado River system. The fundamental controversy between the two States concerns the amount of water to which each State is entitled under the compact and the Boulder Canyon Project Act.

"The dispute dates back to 1922 when six of the seven States in the Colorado River Basin agreed to the Colorado River compact which apportioned the waters from the main river and its tributaries to the upper and lower basins. Arizona was the lone objector. Subsequently, the legislatures of all States, except Arizona, ratified the compact.

"In 1928 the Congress passed the Boulder Canyon Project Act, which provided that the act would not become effective until the California Legislature agreed to limit its use to 4,400,000 acre-feet of water apportioned in article III (a) of the compact, plus one-half of the excess or surplus unapportioned water. California passed such a limitation act in 1929."

Mr. CARSON. That does not specify that it is III (a) water, of course.

Mr. PHILLIPS. No.

Mr. CARSON. Nor does the California contract specify that. I want to read now from the water contract of the metropolitan water district, which contains a clause similar to the other contracts. I am reading from page 300 of what we call the "Hoover bible," "The Hoover Dam Contracts—Wilbur and Ely," coming down to the part of the contract dealing with "Delivery of water by the United States," under explanatory recitals, number (6), is found this language:

"The United States shall, from storage available in the reservoir created by Hoover Dam, deliver to the district each year at a point in the Colorado River immediately above the district's point of diversion (at or in the vicinity of the proposed Parker Dam) so much water as may be necessary to supply the district a total quantity, including all other waters diverted by the district from the Colorado River, in the amounts and with priorities in accordance with the recommendation of the chief of the division of water resources of the State of California, as follows (subject to the availability thereof for use in California under the Colorado River compact and the Boulder Canyon Project Act):"

That is exactly the same provision that is in the Arizona contract, as far as that is concerned. And then it goes ahead and says:

"The water of the Colorado River available for use within the State of California under the Colorado River compact and the Boulder Canyon Project Act shall be apportioned to the respective interests below named and in amounts and with priorities therein named and set forth, as follows—"

That is, waters of the Colorado River available for use within the State of California under the Colorado River compact [continuing]:

"SECTION 1. A first priority to Palo Verde irrigation district for beneficial use

exclusively upon lands in said district as it now exists and upon lands between said district and the Colorado River, aggregating (within and without said district) a gross area of 104,500 acres, such waters as may be required by said lands."

Then, continuing with the priorities, and coming down to section 7, we find this language:

"A seventh priority of all remaining water available for use within California, for agricultural use in the Colorado River Basin in California, as said basin is designated on map No. 23000 of the Department of the Interior, Bureau of Reclamation."

All that these so-called California contracts amount to, as I see, are merely agreements between the State of California agency as to priority of rights in the use of such water as may be available for use in California under the compact and the act, and the Secretary agrees to deliver whatever water is available in accordance with those priorities.

So that I do not want any inference to be drawn one way or the other that there is any distinction between the availability of water to California and to Arizona. The Department has not undertaken to determine or to settle questions as between them. But my contention is that California, by her limitations act, required to be passed by the Boulder Canyon Project Act, has definitely and permanently, if the good faith of the State of California means anything, precluded herself from claiming any part of III (b) water. There cannot be any mistake about that; and—"further, until the State of California, by act of its legislature, shall agree irrevocably and unconditionally with the United States and for the benefit of the States of Arizona—" and the other basin States——

Chairman MURDOCK. From what are you reading now?

Mr. CARSON. From the Boulder Canyon Project Act, section IV.

Mr. PHILLIPS. Mr. Chairman, we are about to recess, and I just want to say, Mr. Carson, that I am not quite clear with regard to the letter of Mr. Hoover, and I was going to ask you if you would care to comment on the comparison between the statements in that letter—and I have not had an opportunity to read them—and the letter which Mr. Hoover wrote on January 25, 1923, when the matter was still very fresh in his mind, apparently, to Senator Hayden. You are familiar with that, are you not, in which he set out definitely in reply to Senator Hayden's questions, the understanding arrived at in conferences in connection with the compact?

Mr. CARSON. I am not prepared to answer now as to what Mr. Hoover said, whether there are any conflicts.

Mr. PHILLIPS. I am not sure that there are.

Mr. CARSON. I do not know; I am not familiar with all of the statements.

Chairman MURDOCK. Gentlemen of the committee, the House is now in session. Anxious as I am to continue the hearings and to conclude them as soon as possible, I am wondering about a session this afternoon.

Mr. WHITE. Mr. Chairman, the debates in the House this afternoon are of paramount importance to all the people of the United States.

Chairman MURDOCK. They certainly are.

Mr. WHITE. And I personally will not be able to be here.

Mr. PHILLIPS. It is my desire to be on the floor, Mr. Chairman. We have a conference report coming up this afternoon.

Chairman MURDOCK. Without objection, the committee will stand adjourned.

(At 12:10 p. m., the hearing was adjourned to meet at 7:30 o'clock the following evening, Tuesday, July 9, 1946.)

HOUSE OF REPRESENTATIVES,
COMMITTEE ON IRRIGATION AND RECLAMATION,
Washington, D. C., Tuesday, July 9, 1946.

The committee met at 7:30 p. m., Hon. John R. Murdock (chairman) presiding.

Chairman MURDOCK. The committee will come to order, please. This is a little unusual for this committee, to hold an evening session, but in view of the crowded legislative program we thought that it would be the best thing to do.

This hearing is a continuation of the hearings on H. R. 5434. Mr. Carson, of Arizona, was on the stand at the close of our last session.

Mr. Carson, you had not completed your statement?

FURTHER STATEMENT OF CHARLES A. CARSON

Mr. CARSON. No.

Chairman MURDOCK. Would you like to continue perhaps without interruption for a while?

Mr. CARSON. Yes. I would like to get my testimony as clear and concise in the record as I can, and then I will be glad to answer questions.

When the committee adjourned yesterday, I had just stated that the Arizona Legislature had ratified the contract and the Colorado River compact, and I would like to put into the record the reference to the act, chapter 4 of the session laws of the first special session of the 1944 legislature, printed in the 1945 Session Laws of Arizona, which ratified the contract between the United States and the State of Arizona and was approved by the Governor on February 24, 1944. That is the contract that is now in the record of this committee which was signed on February 9, 1944.

Chapter 5 of the same session laws of that special session ratified the Colorado River compact. That was likewise approved by the Governor on February 24, 1944.

Chapter 6 appropriated $200,000 for a cooperative survey with the Bureau of Reclamation, which survey has progressed rapidly but has not yet been completed. That act likewise was approved by the Governor on February 24, 1944.

So, with these acts, the Colorado River compact became fully effective between all the States of the Colorado River Basin and the contract between the United States and the State of Arizona became fully effective.

Now, I would like to correct myself in one particular. We have discussed this basin so many times and have always talked about the upper basin States being composed of Wyoming, Colorado, Utah, and New Mexico. Part of Arizona is also in the upper basin—this dotted line being the dividing point [indicating at map]. We have talked about the lower basin being California, Arizona, and Nevada, but a part of Utah, the southwest corner of Utah, is also a part of the lower basin, as is the western part and southwestern part of New Mexico, this [indicating at map] being the dividing line in New Mexico.

We have been talking also of the 2,800,000 acre-feet of water to be delivered to Arizona by this contract. That is not the exact amount; it is subject to reductions by virtue of the use in those portions of Utah and New Mexico which are in the lower basin, and by some other matters that will be discussed by Mr. Baker, our engineer, when he gives the figures on the water supply.

Then, I would like to go back a moment to the statement that California agencies were required to underwrite and guarantee the cost of Boulder Dam. That is not accurate in the ordinary acceptance of the term "underwrite and guarantee." Actually, the dam was built by appropriations by Congress, and the California agencies contracted to buy power at so much a kilowatt-hour, which in the judgment of the Secretary of the Interior was sufficient to assure repayment of the cost, but they never did underwrite or guarantee that cost in the ordinary acceptance of the term. They merely buy electrical energy at a very favorable rate and pay for whatever they receive.

There was at that time reserved for Arizona 18 percent of the power at Boulder Dam, which has now been reduced, which Arizona is trying to get at the same rate California gets and which California is fighting. So there never was any underwriting or guaranty. If Boulder Dam were destroyed tonight California would owe the United States nothing at all; it would be the United States loss.

That, in the main, is the sole source of revenue for the repayment of the dam's cost, except that the metropolitan water district and the city and county of San Diego agree to pay 25 cents per acre-foot in storage for the delivery of water to them for domestic purposes, and the State of Nevada agreed to pay 50 cents per acre-foot for the diversion directly from Lake Mead.

Now the present situation of the use of water in the basin.

The upper basin States are at this time using a little less than 2,500,000 acre-feet. California, under its priority system, is using——

Mr. PHILLIPS. What was that word that you used?

Mr. CARSON. Priority system—under its priority system.

Mr. WHITE. Does that mean superior water rights?

Mr. CARSON. I mean under their domestic priority, in California, the total delivered to California, as I understand it, is approximately 2,600,000 acre-feet, or perhaps 2,700,000 acre-feet now.

The metropolitan water district, under the California system of priorities, has

1,100,000 acre-feet ultimate, of which they had diverted up to last year not more than 60,000 acre-feet in any one year, according to my understanding.

Arizona, out of the main stream, used—including those on the Little Colorado system, which is entirely within Arizona—has been using, consumptively using, between 400,000 and 500,000 acre-feet, the exact figures as to which Mr. Baker will give you.

That is the draft in the United States on the river which has not yet reached any close approximation of the ultimate apportionment or rights to any of the States.

It was suggested here that Aridona needed an underground water code. We know that we need an underground water code. The legislature at a special session in September appropriated $40,000 for a cooperative survey with the United States Geological Survey of the underground water resources of Arizona upon which to base an intelligent and workable underground code. It is hoped that will be presented to, and result in a law at the next session of, the legislature. But that is not any of California's business as to whether or not we have an underground code. We need it for our own protection and the protection of existing developments, and that is the reason that we are adopting it.

It has also been suggested here that we should, prior to the diversion of any water into Arizona, establish, as California did, a schedule of priorities. Bear in mind, please, that of the 2,800,000 acre-feet of water we are now using between 400,000 and 500,000 acre-feet only.

The surveys of the Bureau of Reclamation, and the location for the use of the balance of our water are not yet determined. The central Arizona bill is not yet ready for hearing because the Bureau's reports are not ready or available. We will in all respects abide by, without question, our agreement with the United States that we agree that California can use water up to the limit available to it under its own Limitation Act, and we do not propose to infringe in any way whatsoever upon that. We do figure that out of the 2,800,000 acre-feet there is ample water for the irrigation of the Wellton-Mohawk area, that part of the Yuma Mesa which is to be reauthorized and the central Arizona diversion, and we intend to confine those diversions to the quantities of water which are good for all time and firm without any regard at this time to the use in Arizona of any of the surplus water of the river. That we propose to take up and work out at a later date.

Now it has also been suggested here that all developments in the basin should cease until water is allocated as between the States. I respectfully call the committee's attention to the Colorado River compact which makes a division of the water from the Colorado River between the upper basin and the lower basin which all of us are now parties to, including Arizona and California. I respectfully call the attention of the committee again to the California Limitation Act which, together with the Arizona contract, has by agreement of California and Arizona effected a division between them of the water allocated to the lower basin. It is true it is not a direct agreement between the two States, but if California lives up to her commitments and Arizona to her commitments, the commitments are made.

California agreed with the United States, for the benefit of Arizona, that the uses in California should never exceed 4,400,000 acre-feet of III (a) water plus not more than one-half of the surplus, or water unapportioned by the compact. They made that limitation agreement irrevocably and unconditionally and expressly for the benefit of Arizona. Arizona likewise made an agreement with the United States under which Arizona agreed that she recognizes the right of the United States to contract and deliver to California water, to the extent of the water available for use in California under its Limitation Act, and Arizona at any rate proposes to live up entirely to its agreement.

If California would live up to the letter and spirit of the agreement, this controversy would not have been raised here, as we see it.

California's position, as we understand it here, is: Of course, you will not interfere with us, our use of 4,400,000 acre-feet of water apportioned to the lower basin by article III (a) of our compact, or to our right to use one-half of the surplus, but we will see—and this, to me, seems to be California's position—as far as we are able that you are not able to use the 2,800,000 acre-feet which we have agreed we will never use, and which, if not used in Arizona, cannot lawfully be used anywhere else in the United States, including California.

So all that we ask of California is, if they cannot help us, to see that they maintain the position now and all the rest of the time that they will live up to the

agreements they have already made under the Colorado River compact and the California Limitation Act.

Mr. PHILLIPS. I have not understood that from the testimony so far, but I do not want to interrupt the witness.

Chairman MURDOCK. We will continue.

Mr. CARSON. May I continue and try to make that plain again, Mr. Phillips? California has ratified and is bound by the Colorado River compact, which divides the water between the upper and lower basin. California is bound by the Limitation Act of the California Legislature, which in express terms limits use in California to 4,400,000 acre-feet, plus not more than half of the surplus. The compact apportions the lower basin 8,500,000 acre-feet. Now, the 2,800,000 acre-feet which we are claiming in this hearing cannot lawfully be used in California under the California Limitation Act, and you have agreed for our benefit that it cannot; yet the apparent attempt here is to prevent its being used in Arizona. We can only come to one conclusion on that, that the spokesmen for California agencies are now trying to lay the groundwork to avoid the Colorado River compact and the California Limitation Act.

It seems to me that their attitude is this: Of course, we signed the Colorado River compact; we ratified it. Of course, we passed the California Limitation Act, but we got for those acts of ours the construction of Boulder Dam and our California contracts. We have received all of the considerations that would ever possibly come to us; therefore, those compacts and the Limitation Acts are of no further use to us, so we will seek some way to avoid them and stop Arizona from using the water which we have agreed that we cannot use and which cannot lawfully be used anywhere else in the United States.

Now that position, taken in conjunction with the question of the Pilot Knob power plant and the development of lands in Mexico, seems to us to indicate that there is still in the back of the minds of the California spokesmen the thought that some day somehow they either might avoid these limitations on California use or aid in the development of Mexico at the expense of the United States and Arizona.

There has been a lot of free advice given to Arizona. I would just like to give a little to California—that they recognize now the sanctity and the validity of the Colorado River compact and the California Limitation Act, and that the State of California in its sovereign capacity and the good people of California see that its spokesmen do not take any action which would involve the breach of either of them and involve the good faith and the integrity of the commitments of the sovereign State of California, made in the most solemn way known to man—by compact with the other States and by agreement with the Government of the United States.

Now, I have one further statement, that if this Pilot Knob question and the question of the Mexican lands could be eliminated from California's consideration, or ours, I think that it would be very helpful in creating better relationships between California and Arizona.

After all, we are a part of the same trade territory and economic section of the United States, and we should be helping one another; we should not always be fighting one another.

Mr. PHILLIPS. Of course, Mr. Chairman, that is the way that we felt when the Mexican Water Treaty was under consideration.

Mr. CARSON. Now, I will have to go into that again for a moment—the Mexican Water Treaty.

The Imperial irrigation district was delivering water to Mexico and being paid for the delivery of the water to Mexico and increasing the use of the water in Mexico to where in 1943 and 1944 Mexico had used 1,800,000 acre-feet of water, and that use was rapidly expanding. As we see it, as we saw it then, and we see it at present, it was necessary for the benefit of all the States of the Colorado River Basin, including California, insofar as she wanted to use water within the borders of California, that there be fixed on Mexico for all times an over-all all-time limit on its claim of right of water from the Colorado River and stop that development. That was our purpose, our sole purpose, in supporting the treaty.

Now, the treaty makes these provisions that are necessary, as we see it, in order that we, and all the States of the basin, can get credit for the return flow in the main stem of the river, limiting Mexico's claim for water through the All-American Canal and Pilot Knob power plant to 500,000 acre-feet a year to 1980, and thereafter to 375,000 acre-feet.

Our engineers have estimated that with the desilting water that is necessary

to flow through the Imperial Dam and the return flow, mainly from Arizona projects, there will be in the main stream of the river approximately 1,000,000 acre-feet.

Mr. PHILLIPS. From what source?

Mr. CARSON. From the return flow from the Arizona projects, and the desilting water that must pass through the Imperial Dam.

Mr. PHILLIPS. One million acre-feet?

Mr. CARSON. Approximately 1,000,000 acre-feet. That is the reason for the limitation through the All-American Canal to 500,000 acre-feet. The two together make the 1,500,000, and they played safe by cutting that down after 1980 to 375,000 acre-feet, figuring that by that time there might be 1,125,000 acre-feet of return flow available in the main stream of the river under the Mexican schedules set out.

Mr. PHILLIPS. May I ask you something there? Will you point out these other projects in Arizona that you have been talking about at various times? Will you point out the Salt River project? I thought that while you were at the map it might be a wise thing if you did that.

Mr. CARSON. That has not been worked out in detail, Mr. Phillips. The plan of the Bureau and of Arizona has not yet been worked out.

Mr. PHILLIPS. You have spoken of the San Carlos and Salt River as parts of the Gila system; is that right?

Mr. CARSON. Yes.

Mr. PHILLIPS. Could you just put your finger on it for me?

Mr. CARSON. Let me make a little more general statement.

The present plan is to build Bridge Canyon Dam on the main stream of the river, and from there divert through this tunnel and canal water to the Salt River above the Granite Reef Dam, and on over to the Gila River above the town of Florence.

Mr. PHILLIPS. That is what we call the central Arizona project?

Mr. CARSON. Yes.

Mr. PHILLIPS. What are the ones there now in the Gila system?

Mr. CARSON. The ones that are there now, the Yuma Mesa and the Wellton-Mohawk, all of which return flow enters the river below the Imperial Dam.

Mr. PHILLIPS. Where is San Carlos?

Mr. CARSON. Over here [indicating].

Mr. PHILLIPS. And where is Salt River?

Mr. CARSON. In the central part of the State.

Mr. WHITE. While the witness is at the map, I wish that he would indicate where the Central Valley is in Arizona. Is it north or south of the present Salt River project?

Mr. CARSON. It is the same thing. We just call it the Bridge Canyon central Arizona project. We hope to get a workable project to present to this committee for the bringing of the main stream water from Bridge Canyon Dam through a tunnel and canal to the Salt River, and to the Gila River, to furnish supplemental supplies for these presently irrigated lands in those valleys which are very short of water.

Mr. PHILLIPS. How would you bring it over?

Mr. CARSON. By aqueduct. It is indicated here on this map. We hope also, by an exchange of water, to these lower lands, to release Gila River water for use upstream in the Safford and Duncan Valleys and over into the Virden Valley of New Mexico, so that all those valleys will have an adequate supply of water that will be there in the late summer when they need it. The engineers are now investigating and making detailed surveys to report on the Hooker Dam site in New Mexico as a storage site for the benefit of the lands below it on the Gila in New Mexico, and in Arizona above the Coolidge Dam.

Chairman MURDOCK. Before you leave there, is that part of New Mexico considered within the lower basin, and does that share in the 2,800,000 acre-feet of water?

Mr. CARSON. Yes. Mr. Fernandez, you were not here a minute ago. I wanted to explain to you for just a moment that we have been using rather loosely here the term "upper basin" as referring to Wyoming, Utah, Colorado, and New Mexico. That, in the main, is correct, and through the course of years we have all been talking that way, but actually the upper basin also includes a part of Arizona above this dotted line [indicating]. That is in the upper basin under the definition of the compact. We have been talking about the lower basin as California, Nevada, and Arizona, but actually the lower basin includes the western part of

New Mexico from this line [indicating] down. Also, it includes the southwest corner of Utah from this line over to the Nevada line [indicating].

Our contract with the United States recognizes the rights of those portions of those States in the lower basin to an equitable share of the water apportioned to the lower basin, and we deduct that share as calculated by the Bureau of Reclamation's engineers from 2,800,000 that will otherwise be deliverable to us at Lake Mead. There are certain other deductions that show that the 2,800,000 is a rough figure, but Mr. Baker, when he comes to the stand, will have the figures to show the reduced amount that we think we are entitled to under that contract.

Mr. FERNANDEZ. You spoke about bringing the water down the Colorado River through a tunnel to the Gila River land. That appears to be hundreds of miles.

Mr. CARSON. It is.

Mr. FERNANDEZ. There is no land closer to the source of supply?

Mr. CARSON. There is, but the lands, in the lower Gila Valley, around Florence, Casa Grande, and Coolidge are very short of water and so are the lands in the Safford and Duncan Valleys, by reason of the vested rights in the Florence, Casa Grande, and Coolidge area.

This year, for instance, in the Casa Grande, Florence, and Coolidge area those lands, from surface flow and pumping, will have less than nine-tenths of 1 acre-foot of water per acre this year, and the shortage extends clear up into Safford, Duncan, and the Virden Valley of New Mexico.

Mr. FERNANDEZ. That diversion is not involved in this bill?

Mr. CARSON. It is involved in the central Arizona bill, which is not yet ready for report, but which has been discussed by California as one reason for opposing this bill. But then out of the 2,800,000 acre-feet there will be, according to our figures, ample water to supply the central Arizona project and the Wellton-Mohawk Yuma Mesa project out of firm water, good for all time, involving no part of the surplus, and part of that water we plan to give to the lower users on the Florence, Casa Grande, and Coolidge area, so they will exchange upstream Gila water for use in the Safford, Duncan, and Virden Valleys.

Mr. PHILLIPS. Where are those—farther east than where we are talking about now? I mean those valleys?

Mr. CARSON. Yes; one is in New Mexico.

Mr. PHILLIPS. Did I understand you to say that this dam in New Mexico is a part of the central Arizona project?

Mr. CARSON. Yes.

Mr. PHILLIPS. Is that New Mexico water III (a) water?

Mr. CARSON. Yes; and deductible from our 2,800,000 acre-feet.

Chairman MURDOCK. That is New Mexico water by virtue of the fact that part of New Mexico is in the lower basin; is that right?

Mr. CARSON. Yes.

Mr. PHILLIPS. If that is III (a) water, how about the uses on the Gila westward; is that also III (a)?

Mr. CARSON. I will come to our theory of that later.

Coming back, then, to this Pilot Knob Mexican land question, if the United States paid the Imperial irrigation district for a proportionate cost of the Imperial Dam and of the All-American Canal down to and including Pilot Knob and its power plant adequately and fairly, then it would seem to me that we might avoid this thought of the Imperial irrigation district persuading the other California agencies to fight other States in order to maintain that proposition. And it would be fair and the United States contemplated that in its treaty with Mexico.

I would like to read into the record in that connection a portion of article XIV of the treaty between the United States and Mexico on the water question:

"In consideration of the use of the All-American Canal for the delivery to Mexico in the manner provided in articles XI and XV of this treaty, of a part of its allotment of the waters of the Colorado River, Mexico shall pay to the United States (a) a portion of the cost actually incurred in the construction of the Imperial Dam and the Imperial Dam-Pilot Knob section of the All-American Canal; this proportion and the methods of terms of repayment to be determined by the two governments, which for this purpose shall take into consideration proportionate uses of these facilities by the two countries, these determinations to be made as soon as Davis Dam and Reservoir are placed in operation."

That was contemplated in the treaty, and if there was any aid that Arizona

could give to the Imperial irrigation district in getting adequate compensation for that, we would be glad to do that.

Mr. PHILLIPS. Getting money for water is not always the kind of exchange that you want. I thought that the principal discussion here was on the quantity of water and, under the compact, what part was being charged against III (a) and III (b).

Mr. CARSON. This would involve the Imperial irrigation district surrendering not one drop of water that can be utilized in the United States. This would be only surrendering its right, or claimed right, which it had before the treaty was signed, to permit water to run through the All-American Canal and Pilot Knob into Mexico, which it was then selling to Mexico for money.

Mr. PHILLIPS. I think perhaps we are at cross purposes. The argument that I have heard here, and have been hearing every day, is whether there is enough water. Now the unanswered question still is, "What is the usable quantity of the water," and it seems to me that we have been rather disregaring the quantity of the water available. It seems to me that the people of California have not been attempting to tell the people of Arizona what they can do, but are attempting to find out how much water there is to do it with; is that not right?

Chairman MURDOCK. You are right about quantity of water being involved, but the main question is how much water is lawfully available, both in California and Arizona, and the point I think the witness is now trying to make is that so long as the Imperial irrigation district has an oversized canal with a sufficiently large capacity there is a strong temptation to deliver water to Mexico, which it was doing before the treaty was made, but which the treaty now modifies.

Now, our point is that if the United States Government would pay the Imperial irrigation district a certain cost of that canal down to the Pilot Knob plant and remove the temptation to furnish an overdue amount of water to Mexico for pay, for consideraion, and with the same produce power at Pilot Knob, it would undoubtedly release more water in the basin within the United States for diversion.

Mr. CARSON. And I think that it would take away a lot of this fight.

Mr. DOWD. The Imperial irrigation district has received not one penny for any water that has been run through the All-American canal and delivered to Mexico. Those arrangements have been made directly between the State Department of the United States and the Ministry of Foreign Affairs of Mexico. The financial arrangements are made between the two countries, and the Imperial district has not received one penny from any water run through the All-American canal and delivered to Mexico.

Mr. PHILLIPS. I was just making a note to bring that up later so as to not interrupt the witness, because that was not a deal with the Imperial irrigation district; it was a deal with the State Department.

Mr. CARSON. I will answer that right now. It was brought out in the hearings on the Mexican water treaty before the Senate Foreign Relations Committee, and it is printed in the record, that the financial transactions were between the Imperial irrigation district and its wholly owned subsidiary in Mexico, which owns all of the Alamo canal that serves Mexican lands, and it is all a matter of record in the hearings of the Senate committee. I do not want to get into too much argument here about it.

Chairman MURDOCK. Will you give the exact Senate hearing so that we may have that for the record? This record should show those references to the Senate hearings.

Mr. DOWD. The Imperial irrigation district has been delivering water through the old head gate that has served Mexico and also used to serve the Imperial Valley for many years.

Mexico has been paying the district for the rental of those works, but I repeat and the record will show that the Imperial district has not received 1 cent from the delivery of water through the All-American Canal to Mexico. It has been completely under the control of the United States Government and would be under the control of the United States Government under the All-American Canal contract, when we take over the control of the canal.

Mr. CARSON. The hearings to which I referred are entitled "Water Treaty With Mexico, Hearings Before the Committee on Foreign Relations, United States Senate, Sixty-ninth Congress, First Session, on Treaty With Mexico Relating to the Utilization of Water of Certain Rivers."

Chairman MURDOCK. Will you supply the page reference also?

Mr. CARSON. I will be glad to do so.

(The information requested is as follows:)

"Pages 401, 402, 438, volume 2, testimony of Phil Swing, of California; page 713, volume 3, testimony of M. J. Dowd, of California; pages 1644 to 1652, volume 5, testimony of Evon T. Hewes, of California, president of Imperial irrigation district."

Mr. WHITE. From reading the testimony I got the impression that the Pilot Knob project has not yet been constructed, and I did not know that there was any water being delivered through that source.

Mr. DOWD. May I clear that up? When the United States built the All-American Canal a spillway was necessary at Pilot Knob, and according to the plans worked out with the district, that spillway was constructed from the All-American Canal to the old Alamo Canal which diverts from the river at Pilot Knob. The plan was that the district would install a power plant alongside the spillway, and the discharge from that power plant, as well as from the spillway, could either go into Mexico or back to the river and down the river into Mexico, depending upon the treaty, or whatever arrangements the United States wanted to make.

The Imperial irrigation district did not have, does not now have, and would not in the future have, the control of the water that goes to Mexico by means of the All-American Canal and the old Alamo Canal.

Mr. WHITE. You keep mentioning the Imperial irrigation district. It is clear from the testimony that some district has been selling water to Mexico. I do not know whether it is the Imperial district or some other district.

Mr. DOWD. The Imperial irrigation district has been diverting water at the old heading called the Rockwood Gate, which was the diversion point for Mexico and the Imperial Valley from 1900 to 1942. Since the latter date, the water for the Imperial Valley has come through the All-American Canal. The old heading, which is owned by the Imperial irrigation district, has continued to be used with the sanction and at the request of the State Department for the delivery of water to Mexico.

Mexico got into trouble because the river surface dropped. The river eroded its bottom, and the district could not divert the Mexican demands through the old heading from the river, and by arrangements made between the United States Government and the Mexican Government, the United States diverted water into the All-American Canal, carried it down the canal to Pilot Knob and there turned it back into the old Alamo Canal through the Pilot Knob wasteway.

Mr. WHITE. What does Mexico pay for the service?

Mr. DOWD. Mexico, as far as I know, may have made a payment, but whatever payment Mexico makes for the use of the All-American Canal will be paid directly to the United States Government.

Ask the represenative of the Bureau of Reclamation right now. The Bureau of Reclamation made the recommendation to the United States of the amount of money that Mexico should pay for the use of the All-American Canal and that money paid by Mexico will be paid to the United States Government; is that not right?

Essentially is that not right? Has not the Bureau of Reclamation made the recommendation to the United States as to what Mexico should pay for the use of the All-American Canal? You refused to take into account Imperial district's wishes.

Mr. EATON. I hesitate to answer that without examining Bureau files.

Chairman MURDOCK. We will ask you to supply that information from the Bureau for the record.

Mr. EATON. The chairman requested the Bureau to supply information concerning whatever arrangements have been made by the Bureau of Reclamation relative to payments by the Government of Mexico for water delivered to Mexico through the All-American Canal by means of releases into the Pilot Knob wasteway and those into the Alamo Canal.

Article 27 of the treaty of February 3, 1944, with Mexica provides that, pending regular scheduled deliveries to Mexico subsequent to completion of Davis Dam, the United States will cooperate with Mexico in measures for meeting certain Mexican irrigation requirements. By request of the State Department of the United States, the Bureau of Reclamation delivered in 1944 and 1945 and is delivering in 1946 water through the All-American Canal for release into the Alamo Canal. The Secretary of the Interior has recommended to the Secretary of State the amounts which the Mexican Government should be requested to pay for such deliveries of water and the formula on which those payments are calculated.

Correspondence relative to the initiation of deliveries in 1944 is set forth at

pages 1731–1736 of part 5 of the printed hearings before the Senate Committee on Foreign Relations on the treaty of February 3, 1944. Deliveries in 1945 and the current deliveries are being made on conditions in general similar to those set forth in the 1944 correspondence referred to, particularly in Secretary Ickes' letter of August 14, 1944, to Secretary of State Hull.

The amounts which the Department has recommended to the State Department as payment by Mexico for this service are based primarily on (1) a "capital charge," consisting of a payment, on the basis of the proportionate part of each year in which the canal was in part devoted to serving Mexican needs of the pro rata share of the annual amount necessary to amortize the construction cost of the works involved over a 40-year period with interest at 3 percent, the pro rata share being based on Mexico's portion of the total canal discharges during the period of use to serve her needs, and (2) on an "operation and maintenance charge," covering all costs of operation and maintenance properly allocable to the delivery of water for Mexican use. Whatever other costs and expenses that are entailed by the Bureau in connection with this special use of the canal have been included in the Department's recommended charges. For the year 1944, the Department recommended a payment by Mexico of $51,471.06, and for the year 1945 a payment of $106,885.92 was recommended. Determination of the amount to be recommended for 1946 awaits completion of deliveries.

Mr. PHILLIPS. I would like to support Mr. White's motion again, that this subcommittee go out and look at all of this. I am learning something every day, and I represent one of the areas involved.

Mr. WHITE. The present testimony is somewhat confused. I am under the impression that the All-American Canal was built for and financed by these California irrigation districts, and that the United States built it and they paid the costs, to be repaid by these California water users. Now they are talking about revenue to the United States from Mexico for the use of this All-American Canal. If these districts financed the construction of the canal, why do they not get the charges that are made against Mexico?

Mr. DOWD. The United States says that this money that it receives, if and when it receives any money from Mexico for this past service during 1944, 1945, and this year, some part of it will be credited against the All-American Canal. But you make the very point that we have made.

This canal was built under a contract between the United States and the Imperial district and the Coachella district, whereby those districts guaranteed the repayment of every dime of cost to the United States, but when it came to utilizing that canal that those districts were obligated to pay for, for the benefit of Mexico, the Imperial district and the Coachella district were given no consideration whatsoever.

Mr. CARSON. The point that I am trying to make here, that by that statement it seems to me that if the United States pays the Imperial district a proportionate part of the cost of the Imperial Dam and the All-American Canal to Pilot Knob; and for the power privilege at Pilot Knob if necessary, then this question of the Imperial irrigation district getting California to fight the other States will be largely eliminated. It seems to me it would be further eliminated if the Imperial irrigation district, which now owns all of the stock, as I understand it, of a Mexican subsidiary corporation incorporated under the laws of Mexico, which owns and operates the Alamo Canal that comes off of here [indicating] and irrigates the Mexican lands, could, with the help of the State Department, get paid for that Alamo Canal out of Mexico and entirely divorce itself from any financial interest in transporting water across the border into Mexico. If that were done, I believe that a great deal of this controversy would be eliminated and that the Imperial irrigation district would be in no manner financially hurt.

I do think when the United States takes over the delivery of water through the All-American Canal to Pilot Knob for the benefit of Mexico, limited as it is to 500,000 acre-feet a year by this treaty, that the United States should pay the Imperial irrigation district for a proportionate part of the cost of the Imperial Dam and the canal down to a point including perhaps the power privilege at Pilot Knob itself, and if that were done and the Imperial irrigation district completely divorced itself from the ownership of the canal system in Mexico for which its subsidiary has always been paid—and the stock of which is owned by the Imperial irrigation district—and get away from the idea of having to salvage or save any part of its investment in old Mexico by the sale of water to Mexico, or the delivery of water to Mexican lands, that a great deal of this controversy could be avoided without any financial injury to the Imperial irrigation district.

The United States could well afford to do that. All it would have to do would be to give the Imperial district credit upon the amount which it otherwise would owe, which has not yet been paid.

Chairman MURDOCK. You said a moment ago that that was contemplated, and you were reading from the treaty.

Mr. CARSON. From the treaty itself.

Chairman MURDOCK. What do you mean by "contemplated"? Is it not in the treaty?

Mr. CARSON. Yes; it is in the treaty that Mexico should pay the United States. Let me read it again, article XIV, to make it clear:

"In consideration of the use of the All-American Canal for the delivery to Mexico in the manner provided in articles XI and XV of this treaty, of a part of its allotment of the water of the Colorado River, Mexico shall pay to the United States, (*a*) a portion of the cost actually incurred in the construction of the Imperial Dam and the Imperial Dam Pilot Knob section of the All-American Canal; this proportion and the methods of terms of repayment to be determined by the two Governments, which for this purpose shall take into consideration proportionate uses of these facilities by the two countries, these determinations to be made as soon as Davis Dam and reservoir are placed in operation."

Mr. PHILLIPS. It does not say how much should be paid.

Mr. CARSON. No, but I should think certainly that the Imperial irrigation district, if it made up its mind to comply with the terms of this treaty, could work that out with the United States Government and that the United States would be amply fair to the Imperial irrigation district.

Mr. PHILLIPS. It seems to me that might have been settled before the treaty was signed, do you not think so?

Mr. CARSON. It could not have been settled before the treaty was signed.

Mr. DOWD. I do not want to take the committee's time right now, but I do believe, regarding the unfair accusations against the Imperial irrigation district that Mr. Carson has made, I should be given the time and opportunity to answer them. Moreover, may I say just one thing? He has talked about the sanctity of contracts and how they should be observed. The farmers of the Imperial Valley think the same thing; that their contracts with the United States should be sanctified; should be observed by the United States and should not be considered a scrap of paper to be torn and tossed to one side as it sees fit.

Chairman MURDOCK. What the committee wants to find out are the facts in the case, and I think all of us agree that contracts are sacred and should be so regarded.

Mr. HOWARD. May I say a word in behalf of the Metropolitan water district? The Metropolitan water district has no interest whatever, direct or indirect, in the Pilot Knob power plant, or in the deliveries of water to Mexico, except that we think the Mexican water treaty was unduly liberal.

The elimination of the Pilot Knob power plant from consideration would in no wise affect the attitude of the metropolitan water district to overappropriation or to the overselling of the Colorado River. I just want the record to show that the statement that the elimination of the Pilot Knob plant would go toward solving the problem, so far as the Metropolitan water district is concerned, is without foundation.

Mr. WHITE. Since the old Alamo Canal has been mentioned, is water being delivered to Mexico through that canal?

Mr. DOWD. Not at the present time, because the river has scoured down to where water cannot be diverted from the river at the old Alamo Canal. It has been delivered by the United States through the All-American Canal and then back into the Alamo Canal into Mexico.

Mr. WHITE. Then it gets into the Alamo Canal at some point at the present time.

Mr. DOWD. It comes back into the Alamo Canal just inside the United States and then goes into Mexico.

Mr. WHITE. In what volume?

Mr. DOWD. As much as about 4,000 second-feet has been delivered through the All-American Canal and into the Alamo Canal into Mexico.

Mr. WHITE. Translate that into acre-feet.

Mr. DOWD. 4,000 second-feet running continuously would be somewhere around 3,000,000 acre-feet a year—if you run that amount continuously—but, of course, in the wintertime Mexico uses practically no water at all. They reach a peak for a few weeks in the summertime.

Mr. WHITE. If Pilot Knob comes into use, that same water could be delivered through Pilot Knob?

Mr. DOWD. That is correct, through the Pilot Knob power plant.

Mr. WHITE. And incidentally make power?

Mr. DOWD. Absolutely. It would help the farmers of the Imperial Valley to repay the cost of the canal to the United States.

Mr. WHITE. Who would get the power?

Mr. DOWD. The power could go to the Imperial irrigation district's power system to be sold to the people of the Imperial and Coachella Valleys.

Mr. WHITE. And the Imperial irrigation system would get the revenue?

Mr. DOWD. Yes. The net proceeds come back to the United States to help pay the cost of the All-American Canal.

Mr. WHITE. Do you mean that with the application of the power revenue it would pay out that much sooner and it would really be for the benefit of that irrigation district?

Mr. DOWD. For the benefit of the people who have guaranteed to repay the cost of the canal to the United States.

Mr. WHITE. When the United States is paid off they will get the benefit of the revenue?

Mr. DOWD. Yes.

Mr. WHITE. I understand from the previous testimony, and I think this is very important, that any water that went through Pilot Knob would be that much taken away from the water users in California.

Chairman MURDOCK. Not from water users in California.

Mr. DOWD. No, sir; there would not be 1 acre-foot taken away from any water user in the United States because it is water, up until the time that the surplus is used up, that would not be used in the United States.

Mr. WHITE. The Imperial irrigation district has quite a profit to make there by the power revenue as between the two plans of getting the water to Mexico, or against the three plans of getting the water to Mexico. There is the plan for the return flow from the Wellton-Mohawk to go into Mexico as a credit; the water going down the main river as a credit, or that the water that goes through the Pilot Knob power plant as a credit, and Pilot Knob would be a winner for the California district in a big way in power revenues. Is that not one of the issues?

Mr. DOWD. No, sir. All the water that the lower basin has a right to would be utilized. Our point is that there is not enough water to go around. It is not a question of having a surplus to put through Pilot Knob. The tabulation that I gave the committee the other day shows that; that under final development there is not one drop to go through Pilot Knob except perhaps water which the treaty requires to go to Mexico.

Mr. WHITE. It is a very simple equation, as I see it. If the water goes to Wellton-Mohawk and the return flow goes down the Gila and into Mexico, then the other irrigation districts over in California are that much the losers by failing to get the water to go through and generate power at Pilot Knob. That is one of the main issues here.

Mr. DOWD. That is not the point at all.

Chairman MURDOCK. I feel that is an important point.

Mr. CARSON. That enters into it. I do not know whether or not that is the basis for their objection. If the Imperial irrigation district could be made whole on account of that proportionate investment in the Imperial Dam and the All-American Canal from Imperial to Pilot Knob, and the Pilot Knob power plant, made clear to them, they would have no further question or attack upon this treaty, provided they could further be divorced from their ownership of the canal system, or property in Mexico. If that were done, it seems to me that it would be fairer to the people of the Imperial Valley and they would not in the long run lose anything.

Chairman MURDOCK. Are there not other drops on the All-American Canal beyond Pilot Knob which would permit this irrigation company to produce power and pay for the canal while using their own irrigation water?

Mr. CARSON. It is my understanding there are six other drops on the canal; two of them have been partially developed and four have not been developed at all, although when they built the canal they built in the necessary foundations. But no plants have been installed, and they would have those drops upon which they could make power with water going into the Imperial Valley and into the Coachella Valley in California, to which none of us would have any objection.

Mr. PHILLIPS. It seems to me that every time we have a hearing about water the first thing we know we are talking about power. I still think that we should be talking about water. I think that a great deal of this about the production of power is interesting, but it is not what we are talking about in connection with our bill. I think that we are talking about how much water there is.

Mr. CARSON. You brought it up.

Chairman MURDOCK. That is only part of it. Yes; we must know how much water there is. Then how best to use it. Power is involved secondarily.

Mr. PHILLIPS. I did not bring up the question of power. I think yesterday Mr. Dowd introduced into the record a list—you have it before you—which is headed "Annual water supply in critical periods and demands of existing projects in lower basin."

Now, I think this is about the most important thing that is under discussion right here, and I would like to make this formal request through you, Mr. Chairman, that the Bureau of Reclamation give us a statement as to whether or not they agree with that analysis of water and requirements against the water under the various demands; in other words, take this list and say whether or not the Bureau of Reclamation agrees with it; and if they do not agree with it, have them give us a complete statement of why they do not. It seems to me that we could save a lot of days of hearings if we could get material like that into the record instead of a discussion as to whether there is going to be power made at Pilot Knob or somewhere else.

Chairman MURDOCK. No; Congressman Phillips, the matter of having more than 500,000 acre-feet of water pass through a power plant at Pilot Knob to produce power has a very definite connection with the quantity of water which may be used for irrigation in the United States.

I have that compilation mentioned, and I have one here from an engineer from Arizona, and I notice some difference. I would like to have engineers take the two statements and give us the facts.

Mr. PHILLIPS. That would be fine.

Chairman MURDOCK. I agree with you, Mr. Phillips, that water is the subject here, and I have no reason for mentioning power unless it be that the production of power at some place takes away some of the water from the United States of America, and that is the thing that we must get very clearly in our minds.

Mr. PHILLIPS. It was brought out in the previous hearings, and I think that you should read them—I have read them all—that there would not be any water that would even reach Pilot Knob, if that is what you have in mind, unless it is water that is not used in the United States. If it is taken up and used in the United States it will never get to Pilot Knob and there would not be any power made. The control of the amount of water that gets to Pilot Knob does not rest with the Imperial District nor any other district, but with the United States.

Mr. WHITE. Does the gentleman from California overlook the fact that 1,500,000 acre-feet has to go to Mexico through some channel?

Mr. PHILLIPS. I do not overlook it, and I have been trying to impress that upon other States for the past year.

Mr. WHITE. Do you recognize the fact that in falling water power is inherent and if you utilize that power you can have the power and the water at the same time? I think that is one of the motivating influences in the whole reclamation program.

Mr. PHILLIPS. And I want to know, if we are going to give that much water to Mexico, exactly where we are going to get it and who is going to give it up.

Mr. WHITE. It will come out of the Colorado River, and in the second place, we are going to deliver them 1,500,000 acre-feet. Whether it goes down the main Colorado River and makes no power, or whether it goes over and is used by the Wellton-Mohawk and the return flow goes in as a credit, or whether it goes down the All-American Canal and through the Pilot Knob and generates an income for the California irrigation district, is a matter definitely before this committee.

Chairman MURDOCK. Here is a pertinent fact that I would like to establish. Did the witness say that in 1943 and again in 1944 that 1,800,000 acre-feet of Colorado River water were used to irrigate land in Mexico?

Mr. CARSON. Yes; that was the report by the International Boundary Commission and the Bureau of Reclamation.

Chairman MURDOCK. Well, then, only two things would prevent that happening—or even more being used—in the following years, as I see it. One is a

treaty that will prevent it, and another is that there just is not water in the river. Am I right or wrong about that?

Mr. CARSON. If it had not been for the treaty, we fear that Mexican use would rapidly increase to where eventually it might be as much as 5 or 6 million acre-feet a year, because there is 1,000,000 acres of land immediately below the border in Mexico, so we are informed, irrigable from the Colorado River, and they were rapidly increasing their rights.

Since Boulder Dam has filled, there has been up until 1944 not less than 10,000,000 acre-feet going across the border into Mexico. That would have continued for many years with a great deal of water going across the border into Mexico, because, as I have tried to point out, the States of the Colorado River Basin now are using out of the Colorado River nothing like their ultimate consumptive use that will be made in the basin. I suppose that the total consumptive use now—and I do not have the figures clearly in mind—would be somewhere around 7,000,000 acre-feet in the whole basin.

Until the upper basin, and we in Arizona and California likewise, can make use of the proportions of the water to which they are entitled, the excess will of necessity go across the border into Mexico.

Mr. FERNANDEZ. Regardless of the treaty?

Mr. CARSON. Regardless of the treaty, but without the treaty Mexico could have built up a claim of right. Now, we have with Mexico an inter-American treaty of arbitration signed in 1929 and ratified in 1935 under which we would have been required to arbitrate at Mexico's request a division of the water of the Colorado River which, in our judgment, Mexico could have invoked 50 or 100 years from now and then be awarded whatever water she was at that time using, so it was essential to the benefit of us all, including those that want to use water in California, that an over-all time limit be placed upon Mexico at the lowest possible quantity just as soon as possible, and that was the effect of the treaty.

There has been so much discussion about the treaty by California witnesses here as if that imparted some new consideration into this matter, that I would like to file with the committee—and I know that you can get it—a copy of the treaty.

Now, the question was asked as to where the water is coming from.

Mr. PHILLIPS. I do not object at all to rehearing the treaty because I have been trying to get some of you gentlemen to listen to the conditions involved in that treaty for a long time, and if the chairman will permit me, you asked if 1,800,000 acre-feet of United States water was being credited to Mexico, or could be credited to Mexico.

Chairman MURDOCK. Had been used in Mexico.

Mr. PHILLIPS. I want to say that as a good illustration of what I am talking about, the chairman will remember those were the figures given in the hearing before our Senate committee. They were not the figures given before the Mexican Senate, and in the data furnished the Mexican Senate by its representatives, that data did not show that much water will be used. The only way that amount of water could be built up, for the Senate hearings in the United States, was by including every bit of water that flowed into Mexico, including the water which, at the request of the State Department, was put through the canal and into Mexico to save the Mexican crops, and which at the time the State Department said would not be credited as Mexican use.

Now, I mean to say it is a very complicated matter and I do not want to retry the hearings, but I want to point out there are details in the Mexican treaty which are going to require considerable argument between the United States and Mexico from now on. I would like to say to my friend from Idaho, Mr. White, that I really do not agree with you entirely that the matter before this committee is the amount of water that goes through and makes power. I understand what you mean and agree with part of it, but I think what this committee is discussing, under the bill, is the amount of water in the Colorado River available for all the projects which are being proposed for the use of Colorado River water.

Now, does not the gentleman from Idaho think that is really the issue before us; that the Colorado River is not a miraculous pitcher that you can keep pouring water out of, as you could from the pitcher in the old fable?

Mr. WHITE. The main issue that has been raised before the committee is the division of the water between the three lower-basin States.

Mr. PHILLIPS. That is right.

Mr. WHITE. Incidental to that there comes along with it the problem that we

have to take into consideration that Mexico has a draft on the water to the extent of 1,500,000 acre-feet. You said that they had been delivered 1,800,000 acre-feet.

Mr. CARSON. In '43 and '44.

Mr. WHITE. They have been delivered more than under the treaty.

Mr. CARSON. That was before the treaty was signed.

Mr. WHITE. If they are already limited to 1,500,000 acre-feet they do not have any chance to expand. They are using up the full limit of that water right now.

Mr. CARSON. In that connection I would like to call the committee's attention to H. R. 5944, which was a bill introduced by Mr. Hinshaw, of California, which in my judgment would have the effect of conflicting with the treaty to such a degree that there might be a danger of an abrogation of the treaty by legislative action, so if that ever comes up we certainly would want to be heard upon it, and it certainly is designed to permit the continued flow of water through the Pilot Knob power plant, which I tried to explain, and I am not sure that I made it clear.

It was necessary in the treaty to limit strictly the quantity of water that could go to Mexico through the Pilot Knob power plant to 500,000 acre-feet until 1980, and thereafter to 375,000 acre-feet, and it was necessary to do that in order that the United States, for the benefit of all the States in the basin, could get the benefit of the return flow which enters the Colorado River below the Imperial Dam, which is the take-out point for the All-American-Pilot Knob route of delivery, and this treaty provides that for the return flow entering the river below Imperial Dam the United States gets credit on the total obligation of 1,500,000 acre-feet which would have been lost if the continued flow through Pilot Knob had been permitted, or if the treaty permitted any greater draft through the Pilot Knob power plant.

So I came back to the same proposition, that if the United States compensates the Imperial irrigation district for a proportionate share of the cost of the Imperial Dam and All-American Canal down to Pilot Knob, and the prospective Pilot Knob power production, if necessary, the Imperial irrigation district would be in no sense hurt, and we would have avoided a lot of this questioning and argument.

The treaty provides further, in article XIV of the treaty that Mexico should pay to the United States those same amounts. While I am certain that the United States will reduce the debt of the Imperial irrigation district by a proper and reasonable amount, then the treaty goes ahead and requires that Mexico pay a proportionate part of the operation of the All-American Canal down to Pilot Knob.

Mr. PHILLIPS. Since Mr. Carson has brought that bill in as an issue, I think—while I have not talked to Mr. Hinshaw—that I will now formally request that he be permitted to appear as a witness and say what the points at issue really were in that bill. I am quite sure that the chairman agrees with me that that is a wrong impression of the bill. I will make that as a formal request on behalf of the California delegation for whom Mr. Hinshaw was speaking when he introduced that bill.

Mr. CARSON. I just pointed that out now because it is not up for hearing, and I call attention to the fact that if it does come to a hearing Arizona wants to be heard in opposition.

Mr. PHILLIPS. You made a statement, Mr. Carson, that it would cause conflict between the two nations.

Mr. CARSON. I did not say that, Mr. Phillips. What I meant to imply was that in my judgment it conflicts with the terms of the treaty, and you can, by a legislative act of Congress, as I understand it, nullify and abrogate a treaty. I think this bill goes that far, and we want an opportunity to be heard in opposition to it if it ever comes up for hearing.

Mr. PHILLIPS. The point that I am making now is that the bill was introduced by Mr. Hinshaw at the request of the California delegation, and he was acting for the California delegation. The intent was to prevent further conflict with Mexico, because we are fully convinced that there are unsettled details of the treaty which will eventually provide a very serious argument between the United States and Mexico. Therefore, I would like to make a formal request that Mr. Hinshaw be permitted to come before the committee. He may not want to come.

Chairman MURDOCK. The bill has been referred to this committee, has it not?

Mr. CARSON. I do not know.

Mr. DOWD. Yes.

Chairman MURDOCK. In that case, both parties here have given formal notice that they want to be heard on the bill, one maintaining that it might disrupt

the treaty and the other maintaining that it was intended to lead to better cooperation between the two countries. Both parties should be heard at the proper time. We shall be glad to hear Congressman Hinshaw on this bill.

Mr. WHITE. The provision of that bill is in no way binding upon this committee. It has simply been introduced, and it is within the discretion of the chairman whether to take it up or not.

Chairman MURDOCK. That is right.

Mr. CARSON. Proceeding then, we figure that out of our share of the main stream water there is ample water for this Wellton-Mohawk and Yuma Mesa division and also for the central Arizona project within the firm water, good for all time, without any draft, as contemplated in these bills, upon the surplus, one-half of the surplus to which Arizona is entitled.

If these projects are found feasible and the bills are passed and authorized—and I have no doubt of the feasibility of the Mohawk and the Yuma Mesa division, nor of the central Arizona project, although the reports on the central Arizona project are not yet ready—and we begin to approach the limit of 2,800,000, with the deductions that are made, after these projects are constructed and it appears there is still surplus available for use in the lower basin under these agreements that are now effective, but which later may be withdrawn by the upper basin States, we might at that time consider whether or not we could, on less expensive projects, use that water under some system of priority. But until 2,800,000 is used, we have no necessity for any system of priority on this water in Arizona.

Chairman MURDOCK. Mr. Carson, I want to ask you a few questions. We are approaching the hour for closing. You can be here tomorrow morning at 10 o'clock?

Mr. CARSON. Yes.

Chairman MURDOCK. It has been suggested by witnesses, and it is a suggestion within the recent report of the Bureau of Reclamation on the Colorado River development, that there ought to be an apportionment of water to each State which the Santa Fe compact did not make.

Mr. CARSON. Yes.

Chairman MURDOCK. Especially is that desirable among the lower basin States, I believe.

Mr. CARSON. Yes.

Chairman MURDOCK. It has been suggested here that there ought to be steps immediately taken to authorize a tri-State compact. How do you feel about that?

Mr. CARSON. There is plenty of authority in the Boulder Canyon project act for a tri-State compact. We have tried to make it. Failing to get an agreement with California, we have now arrived at the point where we have agreed with California, according to the terms of the Colorado River compact, and California has agreed with the United States expressly for the benefit of the State of Arizona, as to its limit of use, and we, for Arizona, have agreed for the benefit of California with the United States that we concede California's right to use water up to the extent of her limitation, so the division has been made in the lower basin States just as effectively as though we had been able to make a compact straight across the table between us. It is now made in the lower basin. If California will live up to the Colorado River compact and the California Limitation Act, and we live up too, as we will, in Arizona, to our commitments, then an interstate agreement between California and Arizona is not necessary to a division of the water in the lower basin because we in Arizona recognize that the right of Utah and New Mexico, who are in the lower basin, to come out of our share, and we both recognize the right of Nevada.

Mr. WHITE. What is Nevada's tentative share?

Mr. CARSON. 300,000 acre-feet. She has a contract for that with the Secretary of the Interior to which we have all agreed, and we expressly in our contract agree to that for Nevada.

Chairman MURDOCK. We might as well dispose of this one idea, that it is not necessary for the Congress now to pass a law to permit the lower basin States to enter into compacts. It is constitutionally necessary for Congress to pass such a law for State compacts, but in this case that was authorized by the act of 1928; was it not?

Mr. CARSON. Under the act of 1928. Under that act the upper basin States are going to have a meeting on the 22d to work out another compact.

Mr. WHITE. What is the amount covered by the California limitation?

Mr. CARSON. 4,400,000 acre-feet of III (a) water, plus a part of the surplus or water unapportioned by the compact.

Mr. WHITE. Then under the terms of the contract how much for Arizona?

Mr. CARSON. 2,800,000.

Mr. WHITE. Did you say 300,000 for Nevada?

Mr. CARSON. Yes; the total would be 7,500,000.

Mr. WHITE. Where is this 1,000,000 extra?

Mr. CARSON. It was apportioned to the lower basin. We figure that we are using it in Arizona on the Gila River.

Mr. WHITE. I understand that half of the water that is coming into the lower basin is 7,500,000 acre-feet.

Chairman MURDOCK. Half of the apportioned water at Lee Ferry by article IIIa of the compact.

Mr. WHITE. I am talking now about the original compact.

Mr. CARSON. That is right.

Mr. WHITE. That is divided, in turn, into 4,400,000 feet. That is the limitation California sets for itself.

Mr. CARSON. Yes.

Mr. WHITE. Then by contract between Arizona and the Secretary of the Interior, 2,800,000 feet go to Arizona?

Mr. CARSON. Yes.

Mr. WHITE. And 300,000 feet to Nevada?

Mr. CARSON. Yes; or a total of 7,500,000 feet.

Mr. PHILLIPS. I am not so sure but what I could not clear up this argument by continuing your question right there, Mr. Chairman. May I ask the witness something?

Now, Mr. Carson, do you consider the Gila and the tributaries to the Gila as part of the Colorado River system?

Mr. CARSON. Yes; they are in the definition of the compact.

Mr. PHILLIPS. I would like for you to classify these things for me. Perhaps it will help me. Do you classify, under the Colorado River compact, the perfected rights on the Gila River system—the Salt River that I asked about and the San Carlos and other projects—do you classify those as part of the 7,500,000 acre-feet of III (a) water?

Mr. CARSON. No, sir; because you are overlooking entirely III (b) water, an additional 1,000,000 acre-feet. The apportionment to the lower basin made by the compact is not 7,500,000 acre-feet; it is 8,500,000 acre-feet. III (a) water is 7,500,000 acre-feet, and III (b) water is 1,000,00 acre-feet, so we have a total apportionment of 8,500,000 acre-feet.

California has limited itself to 4,400,000 acre-feet of III (a) water and one-half the surplus, and has excluded herself from III (b) water.

Mr. PHILLIPS. Then, if you do not classify that as III (a) water, you are classifying it as III (b) water. If it is not III (a) water, how do you classify it? You said that you did not classify it III (a).

Mr. CARSON. III (b).

Mr. PHILLIPS. All right, now. Arizona claims 2,800,000 acre-feet. How much of that do you claim from the main stream?

Mr. CARSON. 2,800,000 acre-feet.

Chairman MURDOCK. Some of that goes to Utah and some to New Mexico.

Mr. CARSON. With the deductions that we will show by the engineers.

Mr. PHILLIPS. How much do you claim? You spoke of a court case that you had. How much of the use of the water from the Gila River did Arizona claim in the litigation against California?

Mr. CARSON. I do not know which case you are talking about, Mr. Phillips.

Mr. PHILLIPS. The only one I know about is the first case, the one you spoke about.

Mr. CARSON. That is not the first case. I am glad that you brought that up. Let me explain that to you.

According to my view of the flow of the Gila River under natural virgin conditions, it is reported by all the engineers to be 1,270,000 acre-feet. Part of that water is used over here in New Mexico, part in Arizona.

At the time that the compact was written the consumptive uses on the Gila River in Arizona were figured to be 1,000,000 acre-feet. Now then we have increased our use in Arizona, the last reports indicate, to where we have a use of 1,135,000 acre-feet.

Mr. PHILLIPS. How do you classify the uses on the Gila in excess of 1,000,000?

Mr. CARSON. we deduct them from the 2,800,000 of the main stream, as the engineer will show you. We are dealing now with firm water. We are excluding surplus.

Mr. PHILLIPS. Well, now, this 75,000,000 acre-feet that I think Mr. Dowd spoke about that accumulates every 10 years, is that not all III (a) water?

Mr. CARSON. We think it is III (a) water. California says it is not. Under III (d), the upper basin States are required to deliver 75,000,000 acre-feet each 10 years at Lee Ferry.

Mr. PHILLIPS. You call it III (a) water?

Mr. CARSON. We do not classify it in our contract with the Secretary, but the California contract and our contract are exactly on the same basis, made by the same authority and with the same source of water supply—Lake Mead.

Now, it so happens that Lake Mead's supply of water comes from this delivery at Lee Ferry, with the addition of some water by tributaries between Lee Ferry and Boulder Dam, so that in practical effect the water stored at Lake Mead is the 75,000,000 acre-feet delivered every 10 years at Lee Ferry.

Then the 1,000,000 acre-feet of III (b) water was never in Lake Mead; it was always utilized in Arizona and New Mexico through the Gila River.

Mr. PHILLIPS. If that is so, why would not the upper basin States then have to contribute half of the 1,500,000 acre-feet to Mexico, if you have it all accounted for?

Mr. CARSON. Because the contract between the States, the compact by which California is bound and by which Arizona is bound, all of these contracts were made in expectation of the treaty, and the contracts went so far as to provide how that supply to Mexico would come, first, out of the surplus, and if there was a deficiency in the surplus, then half out of the upper basin and half out of the lower basin.

Mr. WHITE. Is the upper basin ever mentioned in any of the treaties or compacts?

Mr. CARSON. Yes; they agree to the same thing. That is article III (c) of the Colorado River compact.

Mr. WHITE. I would like to get the water straight now in the State of Arizona. You said 1,135,000 acre-feet down there in the Gila River.

Mr. CARSON. Yes.

Mr. WHITE. That is the Salt River Valley.

Mr. CARSON. That is included.

Mr. WHITE. That is 1,135,000?

Mr. CARSON. Yes; 1,135,000 acre-feet.

Mr. WHITE. How much is proposed to be taken on the Wellton-Mohawk under this bill?

Mr. CARSON. 600,000 acre-feet, consumptive use. That is all consumptive use.

Mr. WHITE. Anything that you do not consume goes back to Mexico?

Mr. CARSON. Yes.

Mr. WHITE. Now then, you have a siphon that is bringing some water into the State of Arizona. How much water comes in there?

Mr. CARSON. Mr. Baker will have all those figures accurately. My figures are from recollection, but I think 204,000 acre-feet.

Mr. WHITE. How much is proposed to be diverted for Central Valley by that long canal?

Mr. CARSON. Consumptive use, 1,065,000 acre-feet, which will mean a larger diversion than that.

Mr. WHITE. The only thing that counts in the Gila River is an excess over 1,000,000 feet, which would be 135,000 feet.

Mr. CARSON. That is right.

Mr. WHITE. That is charged against the 2,800,000 feet. Now, you have shown where 4,400,000 acre-feet goes to California, 2,800,000 to Arizona, and 300,000 feet to Nevada, which makes the even half of the river, but Mexico comes in with a draft of 1,500,000 feet of the Colorado River. How are you going to fill that?

Mr. CARSON. Out of the surplus water that is in the river.

Mr. WHITE. Surplus. I thought that the upper and lower basins took all the water.

Mr. CARSON. No, sir; that was not all the water. There is still, according to the reports of the engineers, the 7,500,000 acre-feet for use in the lower basin and in the upper basin. There comes to Lee Ferry approximately 1,500,000 feet extra, surplus, that is apportioned neither to the lower basin nor to the upper basin.

Mr. WHITE. Then the Colorado compact did not take into consideration all the water and you find just about enough to satisfy Mexico's demand?

Mr. CARSON. Yes.

Chairman MURDOCK. Section 3 (c) in the compact covers that. The historical flow of the Colorado River is much greater than the computed average of 15,000,000 acre-feet divided half and half between the two basins.

Mr. WHITE. I am just trying to get this thing straightened out.

Mr. CARSON. That is right.

Mr. PHILLIPS. According to some of the water engineers out there, there is not that surplus.

Mr. CARSON. If there is not, why, we have already agreed where we will get the water. Article III (c)—I am reading now from the Colorado River compact: "If as a matter of international comity, the United States of America shall hereafter recognize in the United States of Mexico any right to the use of any waters of the Colorado River system, such waters shall be supplied first from the waters which are surplus over and above the aggregate of the quantities specified in paragraphs (a) and (b)"—that is the 16,000,000 acre-feet—"7,500,000 to the upper basin and 7,500,000 to the lower basin, with an additional 1,000,000 acre-feet to the lower basin, and if such surplus shall prove insufficient for this purpose, then the burden of such deficiency shall be equally borne by the upper basin and the lower basin, and whenever necessary the States of the upper division shall deliver at Lee Ferry water to supply one-half of the deficiency so recognized in addition to that provided in paragraph (d)."

Mr. PHILLIPS. How much would California get under your computation?

Mr. CARSON. 4,400,000 acre-feet, and half of the surplus, whatever the surplus was.

Now, Mr. Phillips, the surplus cannot now be accurately measured. It will be variable from year to year, and there will be available to California and to Arizona whatever surplus is available in the lower basin with deductions from our share for that part that can be utilized in Nevada, Utah, and New Mexico. Now, for instance, at the present time, of the upper-basin apportionment there is still coming down the river 5,000,000 acre-feet approximately annually.

Mr. PHILLIPS. I was just going to ask you about that.

Mr. CARSON. Of which you could use half and we could use half.

Mr. PHILLIPS. But right now the upper basin is not using the full allotment.

Mr. CARSON. No. That is surplus so far as we in the lower basin are concerned, and we could annually use it with this reserved right to withdraw it.

Mr. PHILLIPS. And they are fixing to use it with some rather large projects. Right now I do not think that the lower basin is using all its water. I think they are going to use it up with these things that we are talking about now. Suppose the upper basin had all of these projects developed for the past 15 or 16 years and that the lower basin had been using up the water with the projects that we are talking about, would there have been any water to give to Mexico?

Mr. CARSON. I think so. I think so, because we do not utilize all of the water of the river.

Mr. PHILLIPS. We do not now.

Mr. CARSON. I mean we would not. When the upper basin reaches its utilization of the apportionment, and we in the lower basin fully utilize ours, there will still be in the river—figured upon the dependable long-time mean average flow, more than enough water to supply Mexico, and the answer is—storage. We will need more storage on the upper basin than in the lower basin to take us over low flow.

Mr. PHILLIPS. I think the chairman said that Mr. Baker was coming in. I will not take your time to ask questions. I will just point out that from the questions that were asked of Mr. Dowd and others it was then shown that there would be a deficit.

Mr. CARSON. Mr. Baker will handle that.

Mr. PHILLIPS. You spoke several times about Arizona being willing to sign a compact and so forth and California not being willing to sign a compact.

Will Arizona right now sign a tri-State compact in the words of section 4 (a) of the Boulder Canyon Project Act, the second paragraph?

Mr. CARSON. I do not think that California will.

Mr. PHILLIPS. I asked you if you will.

Mr. CARSON. Well——.

Mr. PHILLIPS. Will you sign a three-State compact? You have said before this committee that Arizona has sort of wanted to sign a compact but California would not. Will Arizona sign a compact in the exact words of the second paragraph of section 4 (a) of the Boulder Canyon Act?

Mr. CARSON. We cannot sign it in the exact words because we have to have some definitions.

Mr. PHILLIPS. Is not that the whole kernel in the nutshell? In other words, you want to change the Boulder Canyon Act before you sign a compact?

Chairman MURDOCK. It is now 9:15.

Mr. CARSON. No; I do not think that I do.

Chairman MURDOCK. Mr. Carson will be our first witness, and we will continue our questioning at 10 o'clock in the morning.

The committee will stand adjourned until 10 o'clock in the morning.

(The statement of Salt River Valley Water Users' Association expressing its attitude toward the Mexican-Colorado River Treaty referred to earlier, is as follows:)

"RESOLUTION

"Whereas this board of governors of Salt River Valley Water Users' Association authorized the following of its members:

"V. I. Corbell, J. A. Sinnott, H. C. Dobson, and J. H. Evans to represent the said association at the meeting held in Las Vegas, Nev., on January 12 and 13, 1945, in opposition to the proposed treaty with Mexico relating to the allocation of the waters of the Colorado River: and

"Whereas there was adopted at said Las Vegas meeting a resolution in opposition to the proposed treaty with Mexico, which said resolution was supported by the aforesaid members of this board of governors: Therefore, be it

"*Resolved*, That the action of the aforesaid members of this board of governors in voting at the Las Vegas meeting for the adoption of the resolution in opposition to the proposed treaty with Mexico be and it hereby is declared ratified.

"CERTIFICATE

"I, F. C. Henshaw, the duly appointed and acting secretary of Salt River Valley Water Users' Association, hereby certify that the above and foregoing is a true, correct, and complete copy of a resolution duly adopted at a meeting of the board of governors of said association duly and regularly held on the 5th day of February 1945 at which said meeting a quorum was present.

"[SEAL] F. C. HENSHAW, *Secretary*."

(Whereupon, at 9:15 p. m., the committee adjourned to reconvene the next day, Wednesday, July 10, 1946, at 10 a. m.)

HOUSE OF REPRESENTATIVES,
COMMITTEE ON IRRIGATION AND RECLAMATION,
Washington, D. C., July 10, 1946.

The committee met at 10 a. m., Hon. John R. Murdock (chairman), presiding.

Chairman MURDOCK. The committee will come to order, please. We find it necessary to use all the time that we can use because of the early meeting of the House these days, and I have just been informed the House will meet at 10 o'clock tomorrow morning, which will mean we will have to forego a committee meeting at that hour tomorrow.

Mr. Carson was on the stand at the close of our last session. This meeting is a continuation of the hearings on H. R. 5434 and, Mr. Carson, we would like to have you take the stand again. I think you had completed your statement, but there were questions reserved.

FURTHER STATEMENT OF CHARLES A. CARSON—Resumed

Chairman MURDOCK. I should like to lead off with a few questions which I have been holding in reserve, Mr. Carson. It was suggested at one time in the hearings that there ought to be a tri-State agreement among the States of the lower basin. It was suggested that we might authorize by act of Congress such an agreement. Do I understand you to contend there has already been such an authorization and, hence, there is no need for a further authorization?

Mr. CARSON. Yes, sir; under the Boulder Canyon Project Act.

Mr. WHITE. Let me ask a question at that point. Is it inferred from the terms of the Colorado River compact that these States have authority under the provi-

sions of that compact to enter into an arrangement for the distribution and division of that water in the lower basin States; is that the idea?

Mr. CARSON. Yes.

Mr. WHITE. But, in this case, the Congress has specifically authorized by legislation compacts of certain States, authorized the entering into compacts, for the division of water.

Mr. CARSON. Yes; and that authorization here is contained in the Boulder Canyon Project Act that was passed in 1928.

Mr. WHITE. Would a bill authorizing a compact now strengthen the program and call attention of the States, at least call the attention of the people in the States, to the fact they should enter into such a compact if the Congress proceeded to pass a bill specifically authorizing such negotiations or arrangements commonly called a "compact" between the three lower basin States? Would it not be a step for the division of the Colorado River water in advance in getting these States together and getting them to agree?

Mr. CARSON. Not in my judgment.

Mr. WHITE. You are speaking now of the sentiment, or position, or attitude of the several States?

Mr. CARSON. No.

Mr. WHITE. Of those three States; that is the officials' position; but now the people themselves ought to exert some influence to get a compact.

Mr. CARSON. No; it would not, in my judgment, Mr. White. Efforts have been made for many, many years. In 1939 the Arizona Legislature passed a bill authorizing the execution of the tri-State agreement under the terms of the Boulder Canyon Project Act.

Mr. WHITE. Do you have the exact text of the authorization that is contained in this bill, can you put that in the record at this point?

Mr. CARSON. Section 19 of the Boulder Canyon Project Act reads:

"That the consent of Congress is hereby given to the States of Arizona, California, Nevada, New Mexico, Utah, and Wyoming to negotiate and enter into compacts or agreements supplemental to and in conformity with the Colorado River Compact and consistent with this act for a comprehensive plan of development * * *."

And again——

Mr. PHILLIPS. Do you want him to read the whole article?

Mr. WHITE. I just want the citation of the authorization. I think that language he has just read certainly answers the question.

Mr. CARSON. Yes. And there is another provision also in this act. In section 4 of the act it specifically authorized a compact between Arizona, California, and Nevada in this language:

"The States of Arizona, California, and Nevada are authorized to enter into an agreement which shall provide—

"(1) That of the 7,500,000 acre-feet annually apportioned to the lower basin by paragraph (a) of article III of the Colorado River compact, there shall be apportioned to the State of Nevada 300,000 acre-feet, and to the State of Arizona 2,800,000 acre-feet for exclusive beneficial consumptive use in perpetuity; and

(2) That the State of Arizona may annually use one-half of the excess or surplus waters unapportioned by the Colorado River compact; and

"(3) That the State of Arizona shall have the exclusive beneficial consumptive use of the Gila River and its tributaries within the boundaries of said State; and

"(4) That the waters of the Gila River and its tributaries except the return flow after the same enters the Colorado River shall never be subject to any diminution whatever by any allowance of water which may be made by treaty or otherwise to the United States of Mexico but if, as provided in paragraph (c) of article III of the Colorado River compact, it shall become necessary to supply water to the United States of Mexico from waters over and above quantities which are surplus as defined by said compact, then the State of California shall and will mutually agree with the State of Arizona to supply, out of the main stream of the Colorado River, one-half of any deficiency which must be supplied to Mexico by the lower basin; and

"(5) That the State of California shall and will further mutually agree with the States of Arizona and Nevada that none of said three States shall withhold water and none shall require the delivery of water, which cannot be reasonably applied to domestic and agricultural uses and (6) that all of the provisions of said tri-State agreement shall be subject in all particulars to the provisions of the Colorado River compact; and

"(7) Said agreement to take effect upon ratification of the Colorado River compact by Arizona, California, and Nevada."

Mr. WHITE. That is the master agreement made in Santa Fe?

Mr. CARSON. No; this that I just read is the authorization of Congress for the States of Arizona, California, and Nevada to enter into a three-State compact, or tri-State compact, between themselves, subject to the Colorado River compact, which is a different instrument and which was signed at Santa Fe, N. Mex., on November 24, 1922.

Mr. WHITE. Well, that language is in the bill passed by Congress?

Mr. CARSON. Yes, sir.

Mr. WHITE. And pursuant to that authorization California, Arizona, and Nevada have never signed?

Mr. CARSON. Have never signed.

Mr. WHITE. Have never entered into or signed such a compact?

Mr. CARSON. That is right. Now, the Arizona Legislature in 1939——

Mr. WHITE. What is the date of that instrument you read?

Mr. CARSON. That is the Boulder Canyon Project Act, approved December 21, 1928. In 1939 the Arizona Legislature enacted chapter 33 of the 1939 session laws of Arizona which I referred to previously, offering to enter into the compact as set out here. That was a complete failure. I was told here that California considered we had made a change in the language set out in the Boulder Canyon Project Act; but, as I understand it, that was not their reason given for refusal to sign. But I did not participate in those negotiations after the passage of this act. They would strike out the word "and" after the third clause of the Boulder Canyon Project Act where it provides "and (3) That the State of Arizona shall have the exclusive beneficial consumptive use of the Gila River and its tributaries within the boundaries of said State."

Mr. PHILLIPS. Who would strike that out?

Mr. CARSON. The California contention, as I understand it, and their argument would be that this amount from the Gila River must come out of the 2,800 acre-feet.

Mr. PHILLIPS. Mr. Chairman, I do not think that is quite clear in the record. It sounded as if Mr. Carson was saying that California would strike that out. Arizona would strike that out and insert in place of it the words "In addition to."

Mr. CARSON. Yes.

Mr. PHILLIPS. That is the interpretation which Arizona wants to make in the compact?

Mr. CARSON. And which, we submit, the Congress made. And you do not have to go anywhere but to this act to see that that was the intent—that the Gila River should be used exclusively in Arizona and it should be in addition to the 2,800,000 acre-feet of main-stream water; because Congress required that the State of California agree irrevocably and unconditionally for the benefit of Arizona that its total consumptive use should not exceed 4,400,000 acre-feet of III (a) water, plus not more than one-half of the surplus. That completely estops California from claiming any part of the Gila River water, either out of the Gila River or out of the main stream of the Colorado, and says that the Gila must be deducted. I want to say, then, further, that this compact was refused by California. Now, our position is that the intent of this compact is now binding upon California by virtue of its Limitation Act, passed by the California Legislature in 1929, and by virtue of its ratification of the Colorado River compact. So that our contention, as we view it, is that it has already been agreed to by California and is now binding upon California. We just have not got a contract signed between us right across the table on this particular phase. We have on the compact phase; and on this phase California has agreed with the United States irrevocably and unconditionally and for the benefit of Arizona to this construction of this agreement.

Chairman MURDOCK. Mr. Carson, you as an attorney have done the proper thing by reading from those basic laws. I am not an attorney, so I just wanted to get the thing down in plain, simple language so that I can be sure to understand it.

Mr. CARSON. Yes.

Chairman MURDOCK. You have read appropriately almost the entire Santa Fe compact, at least the pertinent parts, and you have read most of the Boulder Dam Project Act and quoted from it quite liberally.

Mr. CARSON. Yes.

Chairman MURDOCK. Do you regard the Santa Fe compact as a binding treaty between the basin States?

Mr. CARSON. Yes, sir.

Chairman MURDOCK. You regard the Boulder Canyon Project Act, an act of Congress, as the law of the river?

Mr. CARSON. As one of the instruments which together make the law of the river; yes.

Chairman MURDOCK. You regard the California statute of limitation passed in 1929 as a condition leading up to the enactment of the Boulder Canyon Project Act as more than a statute; that it is a solemn pledge of a sovereign State in regard to this whole transaction?

Mr. CARSON. Yes, sir.

Mr. FERNANDEZ. Mr. Chairman, nobody contends otherwise.

Chairman MURDOCK. But they might contend otherwise, and I see a possibility of such contention looming on the horizon. Is it not true that an act of the legislature can be superseded and repealed by a subsequent act?

Mr. CARSON. Not in this particular instance; I think not in this instance, because by its terms it was made irrevocable and unconditional with the United States, for the benefit of the State of Arizona and the other basin States in consideration of the passage of the Boulder Canyon Project Act, which was passed. California has already received the consideration and I think can never avoid its limitation act.

Chairman MURDOCK. Now, to go a little further, you spoke of apportioned water under the Santa Fe compact and surplus water.

Mr. CARSON. Yes, sir.

Chairman MURDOCK. What sections of the compact apportions water?

Mr. CARSON. Articles III (a), III (b), and III (c).

Chairman MURDOCK. III (a) making an apportionment between the upper and lower basins?

Mr. CARSON. Yes.

Chairman MURDOCK. III (b) adding an extra million to the lower basin?

Mr. CARSON. Yes.

Chairman MURDOCK. And III (c) having reference to Mexico?

Mr. CARSON. Making apportionment to Mexico in an amount to be determined by treaty.

Chairman MURDOCK. You maintain, then, that III (b) water is apportioned water to the lower basin?

Mr. CARSON. Yes, sir.

Chairman MURDOCK. And can never be regarded as surplus; therefore, it cannot be divided under the terms of the compact and the California Limitation Act?

Mr. CARSON. Yes, sir. You have stated it as I see it.

Chairman MURDOCK. Your contention is, then, that there are 8,500,000 acre-feet of water annually apportioned to the lower basin?

Mr. CARSON. Yes, sir.

Chairman MURDOCK. And California has limited her use of that apportioned water by a statute which cannot be revoked?

Mr. CARSON. Yes.

Chairman MURDOCK. To 4,400,000 acre-feet annually?

Mr. CARSON. Yes, sir.

Chairman MURDOCK. And that that precludes California from asking for or having any part of the apportioned water apportioned to the lower basin other than within her limitation?

Mr. CARSON. Other than that that is within her limitation.

Chairman MURDOCK. Of course, she has one-half of any surplus water.

Mr. CARSON. Yes. And that surplus water is by the compact defined and by the California Limitation Act defined as water which was unapportioned by the Colorado River compact.

Chairman MURDOCK. If there is any shortage of water, then, it must be due to the fact that the original computations were not quite accurate and the water simply is not there.

Mr. CARSON. That is right.

Chairman MURDOCK. I think that suffices for my purpose just now.

Mr. PHILLIPS. Mr. Chairman, you are not suggesting that was a one-sided contract, are you?

Mr. CARSON. No; but——

Mr. PHILLIPS. The answer apparently is "No; but."

Chairman MURDOCK. The "but" means that California got something for her act of limitation. Let us have the other side brought out. I am interested in knowing what Arizona can expect to get out of the 8,500,000 acre-feet allotted to the lower basin.

Mr. PHILLIPS. I think that is what the whole committee is interested in. Last night, just before we adjourned, I had asked Mr. Carson if Arizona would sign a three-State compact in the exact words of that part of the Boulder Canyon Project Act which he this morning read, and I take it the answer is "Yes, but," just as his reply to my question regarding a "one-sided contract" was "No, but." In other words, Arizona does not want to sign it in the terms of that paragraph, but wants to change several words in the paragraph which is already signed, sealed, and delivered.

Mr. CARSON. Only by virtue of this fact——

Mr. PHILLIPS. In other words, it is a matter of interpretation between the two parties to the contract.

Mr. CARSON. No.

Mr. PHILLIPS. And I do not know who can settle that controversy, except a court or a board of arbitration.

Mr. CARSON. No.

Chairman MURDOCK. As I understand Mr. Carson's earlier testimony, he indicated that the Santa Fe compact, as first approved, was unsatisfactory to the Arizona delegation. Gov. Tom Campbell and Mr. Norviel were there, and some others, but the Arizona delegates refused to sign the compact until something was done about the Gila River.

Now, the compact, in its text, does not say that that 1,000,000 acre-feet was in lieu of the Gila River. I think it is unnecessary to prove that such in real truth was the case; it is unnecessary to do that; but I think certainly we have plenty of evidence to show from the letter from Secretary Hoover to Mr. Norviel, together with the picture of Mr. Hoover with his notation on it, and from the testimony of Governor Campbell and others, what the intent was in adding (b) to article III of the compact. Now, whether that would hold up in a court of law and be admitted as evidence is beside the question. The point I am trying to clinch here is this: There is not any doubt about the lower basin having apportioned to it 8½ million acre-feet of water annually, if it is in the river.

All right. Now, California has limited herself to 4,400,000 acre-feet of that water. California passed her Limitation Act to get the Boulder Canyon Project Act from Congress with all its benefits. Now, I cannot see how anybody has any claim to any other part of that water apportioned to the lower basin except Arizona and Nevada. So that it does not make any difference whether that million acre-feet pertained to the Gila River or not.

Mr. PHILLIPS. The other day, before we recessed, I think Mr. Carson had read from a letter from Mr. Hoover, and I would like, in order to complete the record, whenever the chairman will let me have the time, to read from Mr. Hoover's letter, which was dated January 21, 1923, when the matter was still very fresh in his mind, addressed to Senator Hayden, then Congressman Hayden, questions 6, 7, and 8, which were the ones I had in mind. I do not know whether we should put the entire letter in, but question 6 is this, quoting from the letter from Mr. Herbert Hoover to Mr. Carl Hayden of January 21, 1923, which appears in this little book [exhibiting], entitled "Colorado River and the Boulder Canyon Project":

"Question 6. Are the 1,000,000 additional acre-feet of water apportioned to the lower basin in paragraph (b) of article III"—which is III (b) water—"supposed to be obtained from the Colorado River or solely from the tributaries of that stream within the State of Arizona?"

Mr. Hoover's answer was:

"The use of the words 'such waters' in this paragraph clearly refers to waters from the Colorado River system, and the extra 1,000,000 acre-feet provided for can therefore be taken from the main river or from any of its tributaries."

That did not seem to be quite in accord with what has been said.

"Question 7. If more than 1,000,000 acre-feet of water are beneficially used and consumed annually on the tributaries of the Colorado River in Arizona, will the excess above that amount be charged against the 75,000,000 acre-feet of water to be delivered at Lee Ferry during any 10-year period, as provided in paragraph (d) of article III? In other words, will the use of any amount of water from the tributaries of the Colorado below Lee Ferry in any way relieve the States of the

upper division from their obligation not to cause the flow of the river to be depleted below 75,000,000 acre-feet in any period of 10 consecutive years?"

Mr. Hoover replied:

"I can see no connection between the use of waters in Arizona from Colorado River tributaries and the obligation of the upper States to deliver the 75,000,000 acre-feet each 10 years at Lee Ferry. Their undertaking in this respect is separate and independent and without reference to place of use or quantity of water obtained from any other source. On the face of this paragraph this amount of water must be delivered even though not used at all. The obligation certainly cannot be diminished by the fact that Arizona obtains other water from another source. The contract is to deliver a definite amount of water at a definite point above the inflow of various important tributaries—and so forth."

Then the third question:

"Question 8. As a matter of fact, more than 1,000,000 acre-feet of water from the tributaries of the Colorado below Lee Ferry are now being beneficially used and consumed within the State of Arizona. Will the excess above that amount be accounted for as a part of the 7,500,000 acre-feet first apportioned to the lower basin from the waters of the 'Colorado River system' as provided in paragraph (a) of article III?"

And Mr. Hoover said:

"By the provisions of paragraphs (a) and (b), article III, the lower basin is entitled to the use of a total of 8,500,000 acre-feet per annum from the entire Colorado River system, the main river and its tributaries. All use of water in that basin, including the waters of tributaries entering the river below Lee Ferry, must be included within this quantity. The relation is reciprocal. Water used from these tributaries falls within the 8,500,000 acre-feet quota. Water obtained from them does not come within the 75,000,000 acre-feet 10-year period flow delivered at Lee Ferry, but remains available for use over and above that amount."

It seems to me we have this question you have just raised a moment ago and our problem is how much water there is and whether it is III (a) or III (b). And I want to say to Mr. Carson, if I can continue at this point, that I am not wholly clear on what he said last night, because I do not see how water developed in one State can be III (a) water.

Chairman MURDOCK. Before we go to that, may I interrupt for just a moment? We can weigh the testimony of Mr. Hoover in the two letters referred to but I think it is immaterial right now as to whether III (b) water actually was supposed to be Gila water or not, as I said before. The only material thing is that it is allocated to the lower basin States.

One reason I want to bring that out here at all is to show the intent of the Arizona delegates at the Santa Fe meeting. They were doing their best to safeguard the Gila River system, because it had already been put to beneficial use. But it is immaterial whether that III (b) means Gila River water or means Colorado River system water.

Mr. PHILLIPS. Well, the question of whether there is or is not available to California half of the surplus depends on whether or not the Gila users are charged as consumptive users in Arizona.

Chairman MURDOCK. I cannot see how either III (b) water or Gila River water could possibly be surplus water under the terms of the compact.

Mr. PHILLIPS. Now, coming back to this question I asked Mr. Carson last night: As I get it, Mr. Carson, you say that the users of Gila water in New Mexico are using III (a) water, and the users of Gila water in Arizona are using III (b) water. Is that right?

Mr. CARSON. They are using apportioned water in Arizona, New Mexico, Utah, and I think Nevada—they use very little water—and California, out of the 8,500,000 acre-feet. In Arizona we are using a little in excess of the 1,000,000 acre-feet apportioned to the lower basin by article III (b) of the Colorado River compact. That means, then, as I see it—and this is the only place this has any application, as I say again—of the over-all basin use in the entire lower basin, we are limited by the compact to 8,500,000 acre-feet. We having used 1,000,000 acre-feet of III (b) water, or any other water of this apportioned water out of the Gila in Arizona, then it must follow, it seems to me, that the uses in the other States are part of the apportioned water; whether you call it III (a) water or III (b) water, it limits the use in the lower basin of the apportioned water. Therefore, as Mr. Baker will show you, when we are figuring our water supply in Arizona, we deduct from that which is deliverable to us as a firm right at Boulder or Lake Mead any excess over 1,000,000 acre-feet that we ourselves

use of the Gila, that which is used in Utah and New Mexico, and our 2,800,000 acre-feet is reduced to that extent.

What that means in that reduction is that the water is delivered at Lee Ferry and Lake Mead, which we have said is our firm commitment is reduced and the amount of water deducted then becomes part of the surplus, part of which could be utilized in California and part in Arizona, and the only bearing it has on this question, as I understand it——

Mr. PHILLIPS. May I ask one of those "true and false" questions like school teachers like to ask in high-school examinations?

Chairman MURDOCK. And which are rather tricky.

Mr. PHILLIPS. Mr. Carson, is this true, and I quote:

"Said compact, referred to as the Colorado River compact, defines the term 'Colorado River system' so as to include therein the Gila River and its tributaries, of which the total flow, aggregating 3,000,000 acre-feet of water annually, was apportioned and put to beneficial use prior to June 25, 1929, in Arizona and New Mexico."

Mr. CARSON. No, sir; that is not true.

Mr. PHILLIPS. That is not true?

Mr. CARSON. Let me axplain that again, if I may. I want to explain the point on that as I see it. The virgin flow of the Gila River at its mouth is 1,271,000 acre-feet. We divert in New Mexico and Arizona water of the Gila, and redivert, redivert, and redivert to where now we have reduced the flow of the Gila by use in Arizona by the amount of 1,135,000 acre-feet. Our consumptive use of the water of the Gila, therefore, is the amount by which the virgin flow is reduced at the mouth. The term "consumptive use" is not defined in the Colorado River compact; however, it is defined in the Boulder Canyon Project Act, and applies to California as well, I take it, the same rule that would apply to us here. In the California Limitation Act and in the Boulder Canyon Project Act it is defined in this way:

"That the aggregate annual consumptive use (diversions less returns to the river) of water by and from the Colorado River for the use of the State of California" in other words, that means the net river depletion; so when we reduce the flow of the Gila at its mouth it is our net consumptive use.

To illustrate, suppose in the upper basin we will just assume the Fraser River, for instance, up in Colorado, and assume it would in its natural state flow into the Colorado River 100,000 acre-feet, but the people along that stream, we will assume, divert, divert, and divert, and use up that 100,000 acre-feet that would otherwise have reached the main stream of the Colorado River; their consumptive use would be 100,000 acre-feet. You would not go and add up all of the diversions and reuses, which might bring you up to 300,000 or 400,000 or 500,000 acre-feet—probably not that much, but 200,000 or 300,000 acre-feet—by reuse and rediversion. And that is what has happened on the Gila River; we have rediverted.

Mr. PHILLIPS. You mean you take water out of here and measure it down there [indicating], and the difference between the two is the consumptive water?

Mr. CARSON. In reaching the main stream of the Colorado River; you cannot consume more water of the tributaries of the Colorado River than there is there.

Mr. PHILLIPS. Let me ask this other question; this is another "true or false" question. Is this true, and I quote:

"Of the appropriated water"—that is, the Colorado River and its tributaries—"diverted below Lee Ferry, 3½ million acre-feet are annually diverted, used, and consumed in Arizona; 2,900,000 acre-feet are diverted from the Gila and its tributaries. All of the water of the Gila River and its tributaries was apportioned to and for the beneficial use of Arizona and New Mexico prior to June 25, 1929, and there was not on said date, nor has there been since, nor are there now, any unappropriated waters of the Gila River or its tributaries."

Mr. CARSON. No; that is not exactly true. There is some water that now reaches the main stream of the Colorado River from the Gila River. It is not a dependable supply, but comes from flash floods and otherwise. The total quantities there, if you are trying to apply them to the beneficial consumptive use and stream depletion, are greatly in excess of what is actually used, as I have tried to explain.

Mr. PHILLIPS. I rather had in mind the question of contractive use, and so forth, Mr. Carson, in the contracts.

Mr. FERNANDEZ. What are you quoting from?

Mr. PHILLIPS. These are quotations from Arizona's bill of complaint of October 1930, in the case against California.

Mr. FERNANDEZ. How much water is in the Gila River?

Mr. CARSON. There are 1,271,000 acre-feet at its mouth where it flows into the Colorado River, under virgin conditions; that is, before any at all is used in upstream areas.

Mr. FERNANDEZ. How much has been appropriated and put to beneficial use?

Mr. CARSON. Mr. Baker would have those exact figures, but it is 1,135,000 acre-feet reduction by use in Arizona, and I think now 16,000 acre-feet in New Mexico, and provision is made for some expansion in New Mexico.

Mr. PHILLIPS. This is what I had in mind. Mr. Carson read this compact which became binding on Arizona in 1944. Now, at that time the users from the Gila—and that is the only thing I referred to yesterday—the Salt River Valley and the San Carlos had developed to their present extent, had they not?

Mr. CARSON. Yes.

Mr. PHILLIPS. All right; their water rights were then perfected.

Mr. CARSON. On what date?

Mr. PHILLIPS. 1944.

Mr. CARSON. Yes; pretty well perfected.

Mr. PHILLIPS. Now, this act you read—I do not know whether you read this one this morning, but this is the compact, and I quote:

"There is hereby apportioned from the Colorado River system"—which you have already said, Mr. Carson, includes the Gila—"in perpetuity to the upper basin and to the lower basin, respectively, the exclusive beneficial consumptive use of 7,500,000 acre-feet of water per annum, which shall include all water necessary for the supply of any rights which may now exist."

Now, water rights on the Gila being in existence at the time of which the compact speaks, how can that water be charged to anything but III (a) water?

Mr. CARSON. Under (b):

"In addition to the apportionment made in paragraph (a), the lower basin is hereby given the right to increase its beneficial consumptive use of such waters by 1,000,000 acre-feet per annum."

You have to read the whole thing together.

Mr. PHILLIPS. I do not know whether we do. Did not you say something about an increase there?

Mr. CARSON. Yes.

Mr. PHILLIPS. Well, "increase" does not include present use of water contracted for, or water contracted for as of that date.

Mr. CARSON. Yes.

Mr. FERNANDEZ. Does not the word "increase" refer to the quantity apportioned?

Mr. CARSON. Yes.

Mr. FERNANDEZ. They may increase the quantity apportioned, where it is appropriated or put to beneficial use?

Mr. PHILLIPS. Read that again.

Mr. CARSON (reading):

"In addition to the apportionment in paragraph (a), the lower basin is hereby given the right to increase its beneficial consumptive use of such waters by 1,000,000 acre-feet per annum."

Mr. PHILLIPS. Here is what the compact says—I am trying to get it in my mind, and here is what the compact says:

"There is hereby apportioned from the Colorado River system"—that includes the Gila—"in perpetuity to the upper basin and to the lower basin, respectively, the exclusive beneficial consumptive use of 7,500,000 acre-feet of water per annum, which shall include all water necessary for the supply of any rights which may now exist."

Mr. CARSON. Yes.

Mr. PHILLIPS. Then how can you apply the language in (b)?

Mr. CARSON. Yes; it is just a permissive increase of the apportionment from 7,500,000 to 8,500,000 acre-feet—all of the 8,500,000 acre-feet would include all of the water necessary for the supply of any rights which may now exist.

Mr. PHILLIPS. Over and above that already used.

Mr. CARSON. No; not necessarily. This refers to the quantity of the water. In other words, these two together, Mr. Phillips, make 8,500,000 acre-feet apportioned to the lower basin, which must then include the then existing rights.

Mr. PHILLIPS. Mr. Chairman, is that clear to you?

Chairman MURDOCK. One reason why I wanted to get it down in black and white was so that I can read it 10 times and make sure I understand it.

Mr. WHITE. I think I see where the confusion is. If you will read the language, I will point out the confusion to you. Read that statement again.

Mr. CARSON (reading): "There is hereby apportioned from the Colorado River system in perpetuity to the upper basin and to the lower basin, respectively, the exclusive beneficial consumptive use of 7,500,000 acre-feet of water per annum, which shall include all water necessary for the supply of any rights which may now exist. (b) In addition to the apportionment in paragraph (a), the lower basin is hereby given the right to increase its beneficial consumptive use of such water by 1,000,000 acre-feet per annum."

Mr. WHITE. In that language it means "all of the water of the Colorado River system"?

Mr. CARSON. Yes.

Mr. WHITE. And that includes the Gila River?

Mr. CARSON. That includes the Gila River.

Mr. WHITE. And that extra 1,000,000 acre-feet that is in excess of the 7,500,000 acre-feet of the main Colorado is proposed to include the Gila River?

Mr. CARSON. Yes. I cannot quite see the force of Mr. Phillips' argument; because actually California could use none of it under either construction of it. If you assumed that this must include the Gila River in the first 7,500,000 acre-feet, then there is apportioned to the lower basin an additional 1,000,000 acre-feet which cannot be used in California under its limitation act. So it is just a matter of a play on words here. You are already excluded from III (b) water.

Mr. PHILLIPS. I answered that a moment ago by saying I think it does affect California through the availability of a surplus.

Mr. CARSON. That would not help you either; because either way you put it there can be no more surplus in the lower basin until the consumptive use of the lower basin has reached 8,500,000 acre-feet. So whether you figure it one way or the other, you come out at the same end, that the surplus is over and above the quantity of water apportioned to the lower basin by article III (a) and III (b).

Mr. WHITE. There is one question that arises in my mind as to States' rights governing water rights filed by applicants in the several States on the Colorado River system. I am wondering how many valid and existing water rights have been filed by these lower basin States for the use of water of the Colorado River in Nevada, Arizona, and California. California had established certain priority water rights which were recognized, and so had Arizona. What part of the waters of the Colorado River are not covered? What portion of the water allocated by the compact to the Colorado, which is 7,500,000 acre-feet, are not covered by State water rights?

Mr. CARSON. You have to distinguish there between filings, and rights put to use.

Mr. WHITE. Appropriation is what governs, is it not?

Mr. CARSON. Yes.

Mr. WHITE. You can file all the notices you want to; but, if you do not appropriate the water your filings lapse.

Mr. CARSON. That is right. Now, then, as I understand this present situation—and I am speaking without very accurate knowledge—the total present uses of Colorado River water in California which are actually in use approximate 2,700,000 acre-feet.

Mr. WHITE. That does not reach the thing I want to know. I want to know what valid water rights are in existence in the three States to the waters of the Colorado River.

Mr. CARSON. I cannot tell you that accurately.

Chairman MURDOCK. We have an engineer here who will tell us something about the water actually used in Arizona.

Mr. WHITE. It is not the water actually used; it is the water they have a right to use by reason of existing valid water rights.

Mr. CARSON. Mr. White, no matter how many filings were made in any State or how much water was actually put to use, the right in that State is limited by the limitations on that State that are effective here—in California, by the California limitation act, to 4,400,000 acre-feet plus one-half of the surplus. I have no doubt there are in the proper water authority offices in California filings for many times that amount of water, but that limitation is what governs. In

Arizona there are filings for a lot more water than we can take under our limitation, and it is the limitation that should govern in the applications for water rights.

Mr. FERNANDEZ. Mr. Chairman, I think that question is very important in this way: I agree that what Mr. Carson says is true; but in the consideration of this bill it seems to me the important question is whether or not Arizona is about to reach the limit of its 2,800,000 acre-feet. If it has not reached that, then California cannot complain, because they both agree they are entitled to 2,800,000 acre-feet. Now, if they have reached 2,800,000 acre-feet or are about to reach that with this project, then the question of whether or not they are entitled to an additional 1,000,000 acre-feet is important. Therefore, that question, I think, is very important here, and I have been wanting to ask that when Mr. Baker is on the stand.

Mr. CARSON. Yes.

Mr. PHILLIPS. Should not we say, when you say "water," that you mean main-stream water?

Mr. FERNANDEZ. That is what we are dealing with here, is it not?

Mr. PHILLIPS. No; system water.

Mr. FERNANDEZ. System water. Now, you are both agreed, I think, that system includes the Gila River, except Arizona claims they have 1,000,000 acre-feet in the Gila River over and above the 2,800,000 acre-feet.

Mr. PHILLIPS. When you speak about the 2,800,000 acre-feet, you are talking about system water.

Mr. FERNANDEZ. System water. You are both agreed they are entitled to 2,800,000 acre-feet of system water, and until that point is reached California cannot complain.

Mr. CARSON. If you apply system water and try to include it all in one, they have apportioned to the lower basin 8,500,000 acre-feet, not 7,500,000 acre-feet.

Mr. FERNANDEZ. That is true; that is what you contend, but they do not agree to that, but do agree that there is 7,500,000 acre-feet.

Mr. CARSON. Then their limitation is 4,400,000 acre-feet and Nevada's is 300,000 acre-feet. So if you include them all in the same system and use the same measuring stick, Arizona is entitled to 3,800,000 acre-feet, less these small quantities which are used in New Mexico and Utah.

Mr. PHILLIPS. Then if it is not established that the actual beneficial use of the Gila amounts to 2,000,000 acre-feet, the claim of Arizona in the main-stream water would be reduced to 1,800,000 acre-feet; is that right?

Mr. ROCKWELL. I would like to ask a question at that point. Maybe I will get off the track on this, but I would like to ask this question of Mr. Carson and the others. Up in my State I haev heard this water question discussed for a good many years. In fact, I was president of the Colorado Senate when this compact was signed at Santa Fe, and we have always contended that each State had the right to its own water while within the boundaries of that State. I think the Supreme Court so held up until a decision was handed down by that body by a vote of 5 to 4, I believe it was, which changed their policy to first in time, first in right.

Mr. CARSON. That is right.

Mr. ROCKWELL. Went into effect regardless of State boundaries.

Mr. CARSON. That is right.

Mr. ROCKWELL. Now, in our State we still think that some other Supreme Court will decide the way it was originally decided and, if that should happen, what would be the situation here? I do not want to get off on another track, but that may happen at some time and might change this thing upside down.

Mr. CARSON. It would not affect this.

Mr. ROCKWELL. It would the Gila, would it not?

Mr. CARSON. No. I think it would not affect the Gila or the Colorado River compact; because, as I see it now, we have agreed to our limit in each State; not in the upper basin as between States, but between the upper basin and the lower basin where we have agreed. In the lower basin we have agreed, although not directly across the table, through a compact and the California limitation act that our total water, whatever could be used, no matter what the final court decision on that would be, would be out of firm water—ignoring for the moment surplus—3,800,000 acre-feet, and in California 4,400,000 acre-feet. Then the State law in Arizona comes into play as to where it would be used and who would have a prior right within the State, and the California law in California. So, when the State's division is once made, then it is a matter for the State jurisdiction to determine the priorities of its own users within the State. That is

under the jurisdiction of the State and not under the United States. So, I think one of the cases you refer to is that of *Kansas* v. *Colorado* and *Colorado* v. *Wyoming* in which the Supreme Court added up the users in both States and in effect did apply the right of prior appropriation regardless of State lines in determining the quantity each State should have. But here we have done that by agreement.

Mr. ROCKWELL. In other words, that will not affect this question; the upper States, as I understand it, have to turn 7½ million acre-feet down.

Mr. CARSON. Yes.

Mr. ROCKWELL. Then the lower States have 8,500,000 additional between them.

Mr. CARSON. That is right.

Mr. ROCKWELL. So any decision changing that would not affect this particular controversy.

Mr. CARSON. That is right.

Mr. ROCKWELL. It struck me it might only in the case of the Gila River, where Arizona might divide with respect to that water that they had priority over any other State.

Mr. CARSON. It would under the State law in Arizona say that the Gila River and any other appropriations would have priority in the order in which they were made; so that out of our 3,800,000 acre-feet apportioned the first rights would be along the Gila River where it was first put to use, so that they can never be disturbed by anything that any of us can do, nor would any of us want to disturb those rights. So that they are all secure.

You were not here last night, Mr. Rockwell. The total water that Arizona is now using out of the main stream of the Colorado River—Mr. Baker will go into the figures, but it is somewhere in the neighborhood of a little over 400,000 acre-feet. So that under our construction we have 2,800,000 acre-feet less some deduction for the water used in Utah and New Mexico and in addition to the use of over 1,000,000 acre-feet that we use of the Gila, still in the main stream subject to our right to use, and then when that is put to use by this Wellton-Mohawk and Yuma projects and the central Arizona project, the State laws apply in the determination of priority rights, depending upon the priority of appropriation.

Mr. FERNENDEZ. You read from the Boulder Dam Act one provision authorizing the entering into of a compact between the three lower States; then you also read from section 4 another provision which, as I understand, undertakes to interpret the various compacts and transactions that had theretofore taken place, and to place them in a provision for a contract. If that compact, as provided by section 4, is entered into, then that becomes a compact without necessity of ratification by the Congress, because it has already authorized it in specific language?

Mr. CARSON. Yes.

Mr. FERNANDEZ. That is correct; is it not?

Mr. CARSON. Yes.

Mr. FERNANDEZ. Now, if that kind of a compact is entered into, that ends the matter.

Mr. CARSON. I do not think that necessary.

Mr. FERNANDEZ. Why not?

Mr. CARSON. Because California is now bound, as I see it, Mr. Fernandez, by its limitation act to the construction that we place upon this compact.

Mr. FERNANDEZ. Yes; but that limitation act is included in the compact which the Congress has authorized to be entered into?

Mr. CARSON. No; the limitation is effective whether or not this compact is entered into.

Mr. FERNANDEZ. That is true; but if the compact is entered into, then there is no question left?

Mr. CARSON. Yes; I think we would still have the same question.

Mr. FERNANDEZ. The difficulty is that the interpretation which the Congress tried to put into the various transactions your two States interpret differently; therefore, neither Arizona nor California want to enter into that particular compact because you do not understand it alike?

Mr. CARSON. Well, California has raised this one question and that was not raised in the course of the negotiations, so far as I know. I did not hear that until this hearing began, that the Arizona Legislature changed the meaning of this permissive compact as set out in the act.

Mr. FERNANDEZ. That is correct.

Mr. CARSON. And I submit we did not. But since they have raised that question and since in my judgment they are already bound by the limitation act which is effective whether or not the compact is made, then before we enter into any compact with them we should make it absolutely clear. I do not like to enter into compacts in behalf of a State in which there is a disagreement or failure of a meeting of minds upon the meaning of clear language.

Mr. FERNANDEZ. Well, the Arizona Legislature did change the language.

Mr. CARSON. Yes.

Mr. FERNANDEZ. And changed it so as to conform with its interpretation of the proposed compact.

Mr. CARSON. And with the provisions of the California limitation act, also.

Mr. FERNANDEZ. Well, I do not see where the California limitation act has anything to do with that particular section. The main objection of both of you is whether or not you are entitled to 2,800,000 acre-feet of water or 3,800,000 acre-feet of water.

Mr. CARSON. That is right.

Mr. FERNANDEZ. And your legislature did change the language so as to make it clear that you were entitled to 3,800,000 acre-feet.

Mr. CARSON. Yes, sir.

Mr. FERNANDEZ. And California says that is not what is meant by the language which Congress proposed.

Mr. CARSON. I think we are talking about something that would not happen.

Mr. FERNANDEZ. Anyway, that is a fact; is it not?

Mr. CARSON. Yes.

Mr. FERNANDEZ. Now, going back to the other provision, if California and Arizona would sit down together now and enter into a compact which would be in conformity with the compact dividing waters between the two basins, the upper States and the lower States, whether they use this language or other language, if they could agree between them and Nevada, then that compact could be entered into and submitted for ratification to the Congress.

Mr. CARSON. Yes.

Mr. FERNANDEZ. The point I am trying to make is that we do not have to do anything now about reauthorizing any such compact. The three lower-basin States already have ample authority to work out a compact and submit it to Congress for approval.

Mr. CARSON. That is right; that is just exactly correct.

Mr. WHITE. The only thing that appears to me is that in this authorization for a compact that has been read here the whole program was set out in the nature of a limitation; there was not much left for these States to agree upon. They had to take the authorization as it was stated, with that limitation, and the fact is I do not see much use of having a compact except to ratify what the Congress has already outlined in the authorization for a compact.

Mr. CARSON. I don't either, Mr. White, and I don't think we could ever make a compact.

Mr. WHITE. Doesn't that infringe the rights of the three States to the water of the Colorado River having a right to agree on the use of water? Didn't Congress infringe that by setting up the limitations in the authorization of the compact?

Mr. CARSON. No. Congress, at the time this Boulder Canyon Act was passed, put in this permissive clause for a tri-State compact in the lower basin and, for fear California would not enter into that compact, which was the fact, inserted this limitation to California's use, to which California, by act of its legislature, has agreed "* * * and, further, until the State of California, by act of its legislature, shall agree irrevocably and unconditionally with the United States and for the benefit of the States of Arizona, Colorado, Nevada, New Mexico, Utah, and Wyoming, as an express covenant and in consideration of the passage of this Act, that the aggregate annual consumptive use (diversions less returns to the river) of water of and from the Colorado River for use in the State of California, including all uses under contracts made under the provisions of this Act and all water necessary for the supply of any rights which may now exist, shall not exceed four million four hundred thousand acre-feet of the waters apportioned to the lower basin States by paragraph (a) of Article III of the Colorado River compact, plus not more than one-half of any excess or surplus waters unapportioned by said compact, such uses always to be subject to the terms of said compact."

Mr. FERNANDEZ. May I pursue that a little?

Chairman MURDOCK. Yes.

Mr. FERNANDEZ. Will you yield?

Mr. WHITE. Yes.

Mr. FERNANDEZ. You say that because of that, California being assured 4,400,000 acre-feet of water plus one-half of the surplus, that California has no right to come in here and question whether or not Arizona is entitled to 2,800,000 or 3,800,000 acre-feet, so long as they get their water.

Mr. CARSON. That is exactly right—until there is some surplus.

Mr. FERNANDEZ. If you are correct that you are entitled to 3,800,000 acre-feet, then the surplus must be over and above that.

Mr. CARSON. That is right.

Mr. FERNANDEZ. And if they are correct that it is 2,800,000 acre-feet, then the surplus begins when that is used, and there would be 1,000,000 acre-feet of surplus water.

Mr. CARSON. If they could be correct on that.

Mr. FERNANDEZ. To which they would be entitled to one-half.

Mr. CARSON. That is right.

Mr. FERNANDEZ. Or half a million acre-feet.

Mr. CARSON. That is right.

Mr. FERNANDEZ. Then they do have a right to come in and question that provision now, do they not?

Mr. CARSON. No. The point here, Mr. Fernandez, if you take the over-all apportionment of the basin, there is 8½ million feet of water to the lower basin. California is limited to 4,400,000 acre-feet. That leaves Arizona 3,800,000 acre-feet of apportioned water, which California has agreed she can never use.

Mr. FERNANDEZ. But they say it is not 8½ million acre-feet of water, but 7½ million acre-feet. Therefore, they would be entitled to one-half a million of the surplus.

Mr. WHITE. I think that the gentleman from New Mexico is confusing the water in the main Colorado River and the tributary, the Gila River.

Mr. FERNANDEZ. I am not confusing it for this reason, that if the Gila water of 1,000,000 acre-feet that they claim from that stream is credited against what they are supposed to get from the main stream, that leaves them with a claim for much less water than they say they are entitled to, and with that much more surplus to be divided.

Mr. WHITE. The legislative limitation imposed on itself by the State of California, does that conform exactly to the limitation set up in the authorization bill?

Mr. CARSON. Yes, sir.

Mr. WHITE. It conforms exactly?

Mr. CARSON. Yes; it conforms exactly, irrevocably, and unconditionally.

Now, Mr. Fernandez, on that question of what is apportioned to the lower basin, I think that California would agree that 8½ million feet are apportioned to the lower basin. Whether they would agree or not, it is clear from this Colorado compact.

Mr. FERNANDEZ. As Congress interpreted the transactions leading up to the compact and as you interpret the interpretation made by Congress.

Mr. CARSON. No; as the compact shows in its express terms.

Mr. FERNANDEZ. Will you read those express terms?

Mr. CARSON (reading):

"(a) There is hereby apportioned from the Colorado River system in perpetuity to the upper basin and to the lower basin, respectively, the exclusive beneficial consumptive use of 7,500,000 acre-feet of water per annum, which shall include all water necessary for the supply of any rights which may now exist.

"(b) In addition to the apportionment in paragraph (a), the lower basin is hereby given the right to increase its beneficial consumptive use of such waters by 1,000,000 acre-feet per annum.

"(c) If, as a matter of international comity, the United States of America shall hereafter recognize in the United States of Mexico any right to the use of any waters of the Colorado River system, such waters shall be supplied first from the waters which are surplus over and above the aggregate of the quantities specified in paragraphs (a) and (b); and if such surplus shall prove insufficient for this purpose, then the burden of such deficiency shall be equally borne by the upper basin and the lower basin, and whenever necessary the States of the upper division shall deliver at Lee Ferry water to supply one-half of the deficiency so recognized in addition to that provided in paragraph (d)."

Now, I jump down to (f). These others do not affect this particular question.

"(f) Further equitable apportionment of the beneficial uses of the waters of the Colorado River system unapportioned by paragraphs (a), (b), and (c) may be made in the manner provided in paragraph (g) at any time after October 1, 1963, if and when either basin shall have reached its total beneficial consumptive use as set out in paragraphs (a) and (b)."

So there is no question that it is apportioned water, and the Supreme Court of the United States has, it seems to me, in clear and unmistakable language, held that it was apportioned water. So then, if it is apportioned water—and I am clear that it is—then California has precluded herself from ever claiming any part of it because she has limited herself to 4,400,000 acre-feet plus half of the surplus. And, therefore, whether or not you figure it as an over-all apportionment of 8½ million feet to the lower basin, which it clearly is by this language, it leaves 3,800,000 acre-feet for use in Ariozna.

The difficulty and the confusion, it seems to me, comes in this fact, that the Secretary of the Interior by this act was authorized to make contracts for the delivery of water from Lake Mead and everybody was precluded from claiming water except by contract with the Secretary. Well, now, of the 8½ million feet apportioned to the lower basin, 7½ million feet of that comes down from the upper basin and is called III (a) water, but, actually, when you get down to figure the ultimate right to water here, it does not make any difference whether you specify that that is III (a) to the exclusion of III (b); the result is the same. The water coming down from Lake Mead is the only place where the Secretary has authority to deliver water, except by act of Congress. All of these contracts relate to water in Lake Mead, where the supply is limited by the Colorado compact to 7½ million feet. Therefore, in the Airzona contract, that is why we say the Secretary agrees to deliver and we to take 2,800,000 feet. The Secretary has not any jurisdiction over the Gila River.

Mr. FERNANDEZ. Then I am wrong in my assumption and interpretation of the compact that it would result in more water?

Mr. CARSON. I think you are right in your assumption, if there should be any more than 1,000,000 acre-feet of the Gila River depletion; that might reduce our right from the main stream and the difference would be a surplus from which they could take a part.

Mr. FERNANDEZ. That is their interpretation.

Mr. CARSON. Yes. But in doing that, they run into two difficulties. They add up diversions and call them consumptive use, contrary to the language of Congress when it says "diversion less returns to the river." When we use the virgin flow of the river, if we use it entirely in the Gila River, all consumption would be 1,271,000 acre-feet because we would have prevented any return from the Gila River to the main stream. They want to apply one definition of consumptive use to us and another to themselves.

If we are correct on that, they cannot transfer, by any stretch of the imagination, any quantities of water from the Gila River by any mathematical computation to the main stream of the river, which they would attempt to do.

Mr. FERNANDEZ. Now, if no compact is entered into and no judicial determination is made which would determine who is correct, then Congress will do that as it goes along in authorizing new projects.

Mr. CARSON. I do not think so on this.

Mr. FERNANDEZ. Who is going to do it, then?

Mr. CARSON. Let me tell you my theory on this particular bill, which we have largely overlooked in this discussion. But if you could figure, under any stretch of the imagination, that California's position as to the total consumptive use in the lower basin was in any way correct, still, as you have well stated, the only effect of it would be to give them a right to half of whatever mathematical quantity they could figure from the Gila that should be deducted in order to make the consumptive use of 8½ million feet of the lower basin, so that they could claim half.

Mr. FERNANDEZ. Therefore, in doing that, we actually determine this question for ourselves.

Mr. CARSON. No. On this bill, even if——

Mr. FERNANDEZ (interposing). Not necessarily on this bill, but as we go along.

Mr. CARSON. On future projects?

Mr. FERNANDEZ. Yes. When we approach the limit, the Congress will have to decide that for itself.

Mr. CARSON. Yes; but not on this bill, because even under their method of figuring there would be a lot more water in the river than this project would consume—in addition to all uses in Arizona would consume.

My point again is that the Congress has already determined this, Mr. Fernandez, by this limitation act, which California has accepted. California has excluded themselves from any part of apportioned water except 4,400,000 acre-feet, and that leaves 300,000 feet in Nevada and 3,800,000 feet in Arizona.

Mr. WHITE. You mean in the water system—not in the river.

Mr. CARSON. In the water system.

Mr. PHILLIPS. What are the present uses in Arizona?

Chairman MURDOCK. We shall come to that later when we hear the engineer.

Now, Mr. Howard tells me that he is leaving and wanted a few minutes today, and it is pretty near 12 o'clock. I did want to hear from Mr. Baker, the engineer, in answer to some of the questions put by some of the members.

We have with us this morning, Mr. Hinshaw, and I am glad to welcome him to our hearings.

I wish that every member of this committee, in addition to the subcommittee, might sit in on these hearings because it is very important.

Mr. PHILLIPS. When we go into the full committee we will have to go over all this material again.

Chairman MURDOCK. We will have it before us. As one of the members said to me the other day, "I can get this a lot better if I can see it."

Mr. Hinshaw, we will be glad to have you. Did you want to make some statement with reference to the bill?

FURTHER STATEMENT OF CHARLES A. CARSON, SPECIAL ATTORNEY FOR THE STATE OF ARIZONA ON COLORADO RIVER MATTERS

Mr. PHILLIPS. You are Mr. Charles A. Carson?

Mr. CARSON. That is correct.

Mr. PHILLIPS. I told you I had a question to ask you that was more or less serious.

Mr. CARSON. Yes, sir.

Mr. PHILLIPS. You said the other day in your testimony that the water that was being delivered into the Salt River Valley was III (b) water. I wondered whether you do believe that is an accurate statement of that situation?

Mr. CARSON. That is more or less rhetorical, Mr. Phillips. I tried to make that clear for Mr. Rockwell's benefit, as well. The situation is something like this—and I would like to go again to the point where this division was made.

Mr. PHILLIPS. I was just asking the question if you felt that the Gila water used in New Mexico and the Gila water used in Arizona would come into that, and, if so, just how?

Mr. CARSON. I am going back to this proposal, if I may, for a moment, with Mr. Rockwell's statement in mind.

Mr. Rockwell, no matter whether you consider this III (b) water, to be Gila water, or part of this 8½ million acre-feet in the lower basin, it is very clear in my mind that the III (b) water is apportioned to the lower basin, and was water bearing that identical relationship to the Gila River water that I mentioned before, and to which you have addressed your question. I think that is clear, now. It is apportioned to the lower basin, as is likewise the 7½ million acre-feet of III (a) water, so it makes the apportionment to the lower basin 8½ million acre-feet.

Now, California, by her limitation act, has agreed that her use can never exceed 4,400,000 acre-feet of this 8½ million acre-feet, plus one-half of whatever surplus or excess is in the river over and above the 8½ million feet apportionment to the lower basin. So, taking that view of the thing, then, Arizona is entitled to 3,800,000 acre-feet without in any way infringing upon the California limitation. That still leaves 300,000 feet for Nevada.

Of this 3,800,000 acre-feet, we take—and this is the source of the supply likewise—apply that to the Gila River 1,000,000 acre-feet which leaves us out of the main stream 2,800,000 acre-feet. But by those two quantities, 2,800,000 acre-feet, and the million acre-feet, Arizona has reached her limit of consumptive use of apportioned water under the compact, and under the California Limitation Act, California cannot be heard to complain because she agreed with the United States by a solemn, statutory agreement made, as I say, in the most solemn way an agreement could be made involving assurances of one State to the United States, and to her sister States. That agreement was made in terms irrevocably and unconditionally for the benefit of the State of Arizona, as well as other basin States. And it is on that limitation or solemn agreement

that California can never use more than 4,400,000 acre-feet of the water apportioned to the lower basin, plus not more than one-half of the surplus, that we rely, I believe.

Moreover, I think we should apprehend that it is a pure question of mathematics; 8½ million acre-feet as your total: 4,400,000 acre-feet to California: less 300,000 acre-feet for Nevada; leaves 3,800,000 acre-feet for Arizona. If you take those three figures away from 8½ million feet, you should come down to zero.

Then, Mr. Baker has told you that under any of these figures of flow there is ample storage in Boulder Dam to regulate the river and provide a steady flow of water to the projects that are described in this bill; that is the Gila-Wellton project, and the Yuma Mesa-Wellton-Mohawk.

I can illustrate this very clearly. Even if Mr. Dowd should prevail and say we are using 2,000,000 acre-feet on Gila—which we do not admit for a moment—why, we would have to deduct a million acre-feet out of our otherwise main stream apportionment, which would still leave 1,600,000 acre-feet for us in the main stream. This project takes 600,000 acre-feet, which still leaves us with a million acre-feet, with the use on the Indian reservations, and the water required for this project, if we utilized all of that, we would not even then have reached our limitation even under that construction on this project.

Of course, we have gone into a lot of argument about ultimate conditions that may happen in the upper basin and the lower basin, as may now or in the future take effect, but even with those ultimate conditions as projected they would not be jeopardized as to these water rights.

Again, if Mr. Dowd's theory should prevail on the consumptive use on the Gila River—which to my mind it cannot, and is not capable of being done—but even if it should prevail, if they could show that the salvage water on the Gila River—that is, if they can, by salvaging the water, and the salvage I am satisfied would be less than 500,000 acre-feet, and might be as low as 400,000 acre-feet, but even if they should prevail on that, what would happen? That would merely add up on their consumptive use in the basin, and reduce our firm supply and leave a surplus in the main stream to which they would be entitled to one-half. The water would be in the main stream because we are only figuring on the water at Lee Ferry. So if we deduct that from our firm water it is still bound to be in the main stream of the river at Lake Mead, and they could use half of that, so the most we could ever lose is 200,000 acre-feet, or 300,000 acre-feet, or thereabouts.

Therefore, in this question that they are raising here about delaying until an agreement can be made, or until all of these water questions can be settled, it seems to me that they are without any merit at all. I say that because if they are bound, and they are admitting that they are bound by the California Limitation Act, they cannot in any way be heard to complain.

On the question of the arbitration we will not, so far as I am ever authorized to speak for Arizona, ever concede that they are entitled in any way to avoid or evade their limitation act or the Colorado River compact, or the Boulder Canyon Project Act, and unless and until they can do that, then they have already now agreed, and there is no use of our trying to make any further agreement with them. They have agreed now, and they are bound.

Then as to the question of the arbitration, as I said before they are out, because this was an informal arbitration, true, but it was an arbitration, and the recommendation was made, and when it came to Congress, Congress accepted it with but a slight change, and wrote it into the Boulder Canyon Project Act.

I want to say that Congress and California obviously accepted that division, because they wrote in their own requirements in the California Limitation Act, which California adopted. So the agreement is made. The only difference is that instead of California and Arizona signing the same piece of paper, why, they signed with the United States for our benefit; we signed with the United States for their benefit, but the division is made just as squarely and as fully as if there were a different manner of doing it, and if they had gone about it the other way and signed on the same paper, that would not strengthen it in the slightest.

It is not necessary for Congress to undertake to adjudicate water rights to determine between conflicting interest for water. If Congress will read its own act, the Boulder Canyon Project Act, the California Limitation Act, and the Colorado River Compact, it will see that all of these matters here in controversy have already been definitely settled, as definitely as they could be in any agreement or in any court decree. It is settled. It is settled now.

I do not appreciate the fact that they come in and ask this committee to postpone consideration pending the making of an agreement, an agreement by which they are already bound, or to arbitrate again, when they have already arbitrated, and they are now refusing apparently to accept it, or delay until a court can determine it, when they say that they have no way to get into a court. When, as a matter of fact, Arizona filed a suit in 1935 for an equitable apportionment of the water, the California people objected to the jurisdiction of the court, and the court dismissed it partially on the grounds that the United States was not a party to the suit; and also on the grounds that, as the attorneys say, the United States will not take jurisdiction in cases requiring declaratory relief solely. In other words, there must be a valid right, which it is alleged may be endangered, and by the very fact that they say that they are advised by their attorneys that the court will have no jurisdiction is a prime admission that they know that they will not be damaged by this project.

If they thought that this project would be a danger to them, they would say, "Yes, the Supreme Court would have jurisdiction." They say it has no jurisdiction, and the reason they say that is because they cannot make an allegation that they are damaged, before the Court.

Now, Mr. Phillips, it does not make any difference here whether you classify the Gila water as III (a) water or as III (b) water, if you keep in your mind the fact that the entire 8½ million acre-feet of III (a) and III (b) water is apportioned water to the lower basin and California has, by the California Limitation Act, limited herself to a certain amount, and as required by the Boulder Canyon Project Act has made certain commitments. That is all there is to it, as I see it.

All these other questions about these matters brought up in these arguments are, to my mind, to a very large degree, is much to do about nothing, because they fall, when you carefully consider them, of their own weight. After we have settled those, and I do believe I have covered them completely in my statement I just made, the sole question left from these arguments that we have here is what is the total consumptive beneficial use of the Gila River.

I have tried to cover, and I took some little time to do that, the points which are involved in that matter. I believe we will be consistent with the total consumptive use, as measured exactly the same in Arizona as it is in California, diversions less returns to the river, in the language of the Boulder Canyon Project Act. If that be true, then we are using now on the Gila River 1,135,000 acre-feet, and we have Mr. Baker's charts charging against ourselves on the main stream 135,000 acre-feet, which is the amount over and above the 1,000,000 acre-feet of III (b), but is part of the 1,135,000 acre-feet total figure that I gave. We have utilized the III (b) provision merely because it makes a division between the sources of supply.

In the beginning it was agreed that such a provision would be written into the tri-State contract. That was not done, it was not binding, but California, being bound by her limitation act, and excluded from the million acre-feet of III (b), it makes no difference whether you consider it in III (a) or III (b), because whatever it is, III (a) or III (b), we come to this situation: If it is III (b), and it is separated, then it means that California can claim no part of the Gila River; but if it is III (a), then you say there is an additional million acre-feet in the main stream, which California has agreed by her limitation act she cannot take.

In other words, I think the source of the water in each case is clear, and I think that the implications as to what can be done as to that particular water, whatever its source may be, are equally clear.

Mr. PHILLIPS. I should like to read a part of the act into the record; I think it can be found somewhere in here. I think in effect what we have this afternoon is that Mr. Carson is attempting by his testimony to change this statement.

Mr. CARSON. Whose statement?

Mr. PHILLIPS. Your own statement.

Mr. CARSON. I have not changed my statement, I submit.

Mr. PHILLIPS. I think the record will show it. Yesterday you did make a rather definite division between class A and class B waters.

Mr. CARSON. No, sir; I told you yesterday it made no difference which way you figured out, you came out to the same place in the end, that you cannot claim any part of it in California under the limitation act, because this is a portion of the lower basin.

Mr. PHILLIPS. Mr. Carson, you said a minute ago that this has been arbitrated, and you also said that California had refused to arbitrate.

Mr. CARSON. I said "agreed informally to arbitrate," not binding or anything like that. I made that clear, in my opinion.

Mr. PHILLIPS Also, I do not think you meant to emphasize the fact that California was claiming to be injured now. I do not think that is the claim, and that is the first time it has been set up, the presumption that we should not figure now on the conditions in the river at future times. It seems to me that that is exceedingly important, if the upper basin is going to be exhausted of its water rights, and the lower basin is going to be exhausted of its water rights, every State in the basin is interested in the future water supply, and particularly southern California, where all of this water has been presumbly contracted for.

Now, I just would like to ask Mr. Carson in very simple language: Do I understand now that Arizona refuses to arbitrate?

Mr. CARSON. Yes, sir; you can understand that.

Mr. PHILLIPS. And yet the record will show the other day that Mr. Carson said that California refused to arbitrate.

Mr. CARSON. Yes, you did; because we tried it.

Chairman MURDOCK. I cannot see any inconsistency there.

Mr. CARSON. It was an informal matter.

Chairman MURDOCK. To my personal knowledge, there has been effort made to get Arizona and California to get together for a quarter of a century, ever since 1923, certainly since 1927, and more certainly since the Boulder Canyon Project Act was passed. Somebody, some place, has held up the agreement.

I want to make this point clear: As I understand, Mr. Carson, in order to bring an action before the Supreme Court you have to show that you are being injured?

Mr. CARSON. That is true.

Chairman MURDOCK. It is useless for us to talk about litigation to settle this thing until one or the other is placed at a disadvantage, and one or the other of the contestants can show that he is being injured. If this question cannot be brought into court, if it cannot be effectively arbitrated, and if, as some contend, it cannot and should not be determined by an act of Congress, then it cannot be settled, therefore nothing will be done. The status quo should be highly satisfactory to interest and agencies in California now getting practically all the benefits from the river.

Mr. PHILLIPS. I do not think anybody claims he is injured now. I think Mr. Dowd said there is today an excess of water, but I asked you the other day, to be consistent, if you would recommend the building of water projects anywhere which subsequently might be found not to have enough water available to them.

I will say this for the record, and I will say it categorically, that California supports and will continue to support and stand behind the compact, stand behind the California Limitation Act, and the Boulder Canyon Act, and we will arbitrate. Let Mr. Carson say what he may.

Mr. WHITE. What about the contract between the Department of the Interior and Arizona, do you accept that?

Mr. PHILLIPS. I do not know the wording of it. I would have to look into it more.

Mr. DOWD. We will accept it on the basis that the then Secretary of the Interior Ickes said he signed it. We intend to put into testimony certain parts of this contract between Mr. Ickes and the State of Arizona; we agree that there was such a contract.

Mr. WHITE. Do you not think that the contract between California and Arizona is still material and binding as to the limitation act?

Mr. DOWD. No, sir; because under the Boulder Canyon Act, Congress set up certain limitations. It said, "If you will accept these limitations, we will do so-and-so." The Secretary was under a mandate to make contracts, under that act, with California, and California, within the limits of the limitation act, was in a position to make contracts with the Secretary of the Interior.

Mr. WHITE. That is undoubtedly so.

Mr. DOWD. Well, we will stand back of it.

Mr. WHITE. I believe you are qualified as a lawyer?

Mr. CARSON. Yes, sir.

Mr. WHITE. I believe you are familiar with water-right laws?

Mr. CARSON. Quite a few. I am quite familiar with them.

Mr. WHITE. State laws concerning them?

Mr. CARSON. Yes.

Mr. WHITE. Before any negotiations were undertaken by the States of Cali-

fornia, Arizona, and Nevada; in fact, before there were any negotiations undertaken between the States of the upper basin and the lower basin with the Federal Government, the States had certain rights to the water of the Colorado River; is that a fact?

Mr. CARSON. Yes, sir.

Mr. WHITE. By authorization of Congress, the several States entered into an agreement or so-called compact with the Federal Government for certain use of the waters of the Colorado River?

Mr. CARSON. That is correct, sir.

Mr. WHITE. In making that agreement and compact, did that convert and convey certain rights to the Federal Government to the control of waters in the Colorado River?

Mr. CARSON. No; generally speaking, I think, Mr. White, that it made the agreement between the States that a portion of the water in the upper and lower basin would be apportioned. Then Congress, by the Boulder Canyon project, gave rights to the United States, and nobody claimed otherwise, so far as I know, under the United States, save that it should be controlled by the compact.

In other words, I think that that is all embodied in the compact and does not go beyond it in any case.

Mr. WHITE. Let us discuss the compact. Do the provisions of the compact convert and convey rights to the Federal Government to go in and exercise some control over the waters of the Colorado River by regulating its flow?

Mr. CARSON. I see what you mean. No, sir; but it is provided in the Boulder Canyon Act that the Secretary of the Interior was authorized to make contracts for the storage and delivery of the water in what is now known as Lake Mead, and that nobody could acquire or claim such rights except by such contract with the Secretary of the Interior, and it is under that provision that these California contracts are executed. These contracts are on that same basis, both as to the authority of the Secretary of the Interior to make them and as to the water in storage behind Boulder Dam in Lake Mead, are subject to availability to California and Arizona in exactly the same way, by virtue of the contracts in connection with the water of the Colorado River stored at Lake Mead and the Boulder Canyon Project Act, Colorado River compact, and California Limitation Act.

Mr. WHITE. Under the provisions of this compact, the Santa Fe compact, it continued to recognize the existing water rights and the existing appropriations of water?

Mr. CARSON. That is correct.

Mr. WHITE. And that was all taken care of in the provisions of the compact?

Mr. CARSON. That is correct.

Mr. WHITE. Then the Government proceeded to enter into contracts for the diversion of water to California communities, and the California so-called contractors?

Mr. CARSON. That is correct.

Mr. WHITE. To that extent that is the situation?

Mr. CARSON. I think that would be so. Of course, there are certain provisions in there.

Mr. WHITE. To that extent, the Federal Government enters into the situation?

Mr. CARSON. That is correct.

Mr. WHITE. To that extent, there was also authorization to the Federal Government to enter into an agreement with the States and the States themselves, and at the time by themselves, and with the Federal Government agreed to devote their energies and their will to the diversion of water from the Colorado River, and the States, by that agreement, surrendered to and conferred upon the Federal Government certain rights to the control of the waters of the Colorado River?

Mr. CARSON. That is the way that this thing was carried out, so far as water stored in Lake Mead is concerned.

Mr. ROCKWELL. Is that the actual fact? I do not understand it to be quite that way. We do not confer upon the United States Government; we agree that an agency by which these compacts are carried into effect could do certain things; we had to have some agency.

Mr. CARSON. Maybe I do not understand correctly.

Mr. WHITE. But did the water users or contractors contract with the Secretary of the Interior for the use of the water?

Mr. CARSON. From Lake Mead, the United States, acting under and by virtue of that act.

Mr. WHITE. The Lake Mead water, but that is simply an enlarged place in the Colorado River.

Mr. CARSON. It is a place where water is stored in the Colorado River.

Mr. WHITE. Is it an enlarged place where all the water that comes down the Colorado River flows, all of it flows ultimately through Lake Mead?

Mr. CARSON. That is correct.

Mr. WHITE. All in the world that Lake Mead is, is a plan to regulate the flow of the Colorado River?

Mr. CARSON. Yes; it stores it and holds it.

Mr. WHITE. It stores it in high-water periods and by that means regulates the flow of the Colorado River?

Mr. CARSON. That is correct.

Mr. WHITE. Laying aside the fact that there is a generation of power there, it is still the purpose of Lake Mead or Boulder Dam, as I have inicated?

Mr. CARSON. That is correct.

Mr. WHITE. To regulate the flow of the Colorado River?

Mr. CARSON. That is correct.

Mr. WHITE. By the terms of this compact with both the upper basin and the lower basin States, they transferred certain of their rights to the United States Government.

Mr. CARSON. By the Boulder Canyon Project Act and these water contracts. They surrendered their rights to control the storage of water in Lake Mead, and beyond that it would be my construction that we did not surrender any rights on the Colorado River, as a whole. You cannot get water out of Lake Mead stored there except by contract with the Secretary of the Interior, then Mr. Ickes. When we do get it in our various States then the State law governing prior appropriations enters into the picture for the first time for a determination of relative priority rights in the respective States.

Mr. WHITE. I have not made a detailed study of the language of the Colorado compact, or the contracts entered into under the terms of that compact, but it is my understanding that the Federal Government, acting under the authority conferred upon it by the Colorado compact, which was made at Santa Fe, N. Mex., and supporting legislation, entered into a contract with the States, and with the city of Los Angeles, and with the metropolitan water users district to divert and deliver to these two contractors a certain portion of the waters of the Colorado River. Is that right?

Mr. CARSON. That is a correct statement.

Mr. WHITE. They did that under some authority.

Mr. CARSON. So they did.

Mr. WHITE. And the Federal Government, until the compact was entered into, had no authority.

Mr. CARSON. I am not so sure that it necessarily arises in the compact.

Mr. WHITE. Did not the States enter into this contract thereby conveying certain rights to the Federal Government?

Mr. CARSON. That is hard to answer that directly. I think the Secretary of the Interior evidently has the right to contract for the storage and delivery of water at Lake Mead, and that nobody can get that water except by contract with the Secretary of the Interior once it is stored in Lake Mead.

Mr. WHITE. How did the Secretary of the Interior obtain that right?

Mr. CARSON. By the provisions of the Boulder Canyon Project Act, which authorized the construction of the dam.

Mr. ROCKWELL. At this point, I should like to read an excerpt from the act; I will just paraphrase it slightly, in which it says: Nothing herein shall be considered as interfering with State rights as the States now have either of the waters within their borders or to adopt such policies and enact such laws as they may deem necessary with respect to the appropriation, control, and use of waters within their boundaries, except as modified by the Colorado River compact, or other interstate agreements.

Does that in general state what you think to be the situation in that regard?

Mr. CARSON. That is true.

Mr. WHITE. That is right in harmony with what I have just said. The State did transfer certain rights to the waters of the Colorado River to the United States Government. Maybe I did not state it just that way, but it seems to me that it follows right along that very same line.

Mr. ROCKWELL. It goes on to discuss the matter of agreements or contracts in connection with the construction of the dam, and the headwaters which would be before the dam, and the necessary flood-control regulations, and so forth, and their authorizations there. I can read that, if necessary.

Mr. WHITE. Who has the authority and who does it authorize? It seems to me that would be the point in question.

Mr. ROCKWELL. Section 19, I think you might turn to. There is a reference there to negotiate and to enter into compacts or agreements supplemental to and in conformity with Colorado River compact, and consistent with this act for the comprehensive plan for the development of the Colorado River, and provide for the storage, diversion, and use of waters of the Colorado River.

Mr. WHITE. Diversion of the waters?

Mr. CARSON. I do not want to be understood here in any way as saying that the States have surrendered the control of the waters within their boundaries to the Federal Government. As I take it, authority of the Secretary of the Interior in regard to the river is limited to the waters stored in Lake Mead behind Boulder Dam, and the Secretary has authority under section 5 of the Boulder Canyon Project Act to do certain things, which I think you have reference to there.

Mr. WHITE. What did the compact say? That is what the States entered into. Congress, in the Boulder Canyon Project Act—that is the only case where the Federal Government had rights and authorities conferred on the Federal Government in that manner.

Speaking generally, the Federal Government has rights and authority conferred on it by the Constitution of the United States. Now, then, the States have granted certain rights to the Federal Government, and retained all their other rights to themselves.

Mr. CARSON. That is correct, sir.

Mr. WHITE. For that reason, the State constitution is a limitation and the Federal Constitution is a grant of power.

Mr. CARSON. Speaking broadly, that is correct.

Mr. WHITE. Coming down to what happened here, the States entered into a compact with the utilization—or for the utilization of the waters of the Colorado River, and made some obligation or entered into some obligations with the Federal Government. My questions are directed to ascertaining, if possible, just what happened.

If the States in this particular instance conferred certain rights, or relinquished certain rights, to the apportionment of the water of the Colorado River, I think we should know that.

Mr. CARSON. No; not at all, in my judgment, except to the water stored in Lake Mead behind Boulder Dam.

Mr. WHITE. Then the normal flow of the Colorado River, aside from storage of water, the normal flow would still be under complete control of the States?

Mr. CARSON. In each State as effected by the Colorado River compact.

Mr. WHITE. We had this same issue on Lake Pend Oreille. The Pend Orielle River runs into Canada, and due to the international situation we could not disturb the normal flow of the river, but there was nothing to prevent us from storing back the surplus water in the lake that would otherwise run off, and utilize that for our own discretion and advantage.

Mr. CARSON. That is what the Government did, you see. They authorized the Secretary of the Interior to make contracts and to prevent individuals from getting water except by contract.

Mr. WHITE. That still leaves the question open as to the division of the waters of the Colorado River as between the three States of California, Arizona, and Nevada, unless you can convince the committee that the contracts entered into between the State of Arizona and the Federal Government, through its Department of the Interior, Secretary Ickes, and the limitation that California placed on the use of the water and the contract entered into with the State of Nevada, did not, in effect, divide and appropriate the water of the Colorado River.

Mr. CARSON. In the lower basin, that is my position. I think that has already been done, by the agreement made by California with the United States for our benefit—benefit of Arizona.

Mr. WHITE. You do not seem to take a consistent position. In one place you say that the States have not surrendered any rights, and in another place you say that by reason of some agreement with the Secretary of the Interior representing the United States, that he has the controlling and paramount power over this water. You seem to be in an opposite direction in those two cases.

Mr. CARSON. I think not. Let me explain it to you.

The compact is between the States and the water division made by the compact is between the upper basin and the lower basin; in the lower basin the

division is made between the States by virtue of the California Limitation Act; the California contracts and the Nevada contract and the Arizona contract. They are just as effective in my judgment as if they were a tri-State contract, and do affect the division in the lower basin. That is what I am getting at there.

The over-all supply in the lower basin is 8½ million acre-feet, and California has, by agreement with the United States, made an irrevocable and unconditional contract for the benefit of Arizona, according to the way I interpret that, that they will take 4,400,000 acre-feet, and no more, except one-half of the surplus or excess water that may accrue.

Mr. WHITE. You are not bringing in something new for the benefit of Arizona?

Mr. CARSON. No, sir. I emphasized that the very first time.

Mr. WHITE. That is, bringing anything in the record to help Arizona.

Mr. CARSON. Yes; the State of California by act of its legislature agreed irrevocably and unconditionally with the United States of America, and for the benefit of the State of Arizona, as well as Nevada, California, New Mexico, Utah, and Wyoming, as an express covenant, and in consideration of the passage of this that the aggregate annual consumptive use (diversion less return to the river) of water of and from the Colorado River for use in the State of California including the use of water necessary for the supply of any rights which may now exist, shall not exceed 4,400,000 acre-feet of the waters apportioned to the lower basin, as set forth by paragraph (a) of article 3 of the Colorado River compact plus not more than one-half of any excess or surplus waters unapportioned by said compact, such use to be subject to the terms of said compact.

That is practically, although not completely, a quotation from the act itself. You see, I know these things pretty well. I simply live with them.

Mr. WHITE. Was that prior to or subsequent to the entering into of the California Limitation Act?

Mr. CARSON. This act was passed in December 1928.

Mr. WHITE. I understand this is a Federal act.

Mr. CARSON. This is a Federal act; yes, sir.

Mr. WHITE. It was passed before or after the California Limitation Act?

Mr. CARSON. Before the other was passed.

Mr. WHITE. California, in response to that act, proceeded to comply with requirements of the Federal Government, and passed the limitation act by its legislature?

Mr. CARSON. I will have to refer to the first part of this section, because I think that will make it rather clear. I am talking now about the Boulder Canyon Project Act. [Reading:]

"This Act shall not take effect, and no authority shall be exercised hereunder and no work shall be begun and no moneys expended on or in connection with the works or structures provided for in this Act, * * * until the State of California, by act of its legislature, shall agree irrevocably and unconditionally with the United States, and for the benefit of the State of Arizona—"

And so on. They passed it in order to get this act effective. They adopted the act of the California Legislature in 1929—I think it was in March 1929; was it not, Mr. Dowd?

Mr. DOWD. I think so. Then the States ratified the compact, and the compact became effective with the proclamation of the President of the United States.

Mr. CARSON. That is true. After the States ratified the compact, the compact became effective by the proclamation of the President of the United States on June 25, 1929, in which he recited these particular points, and I wish to refer to one in particular, to the effect that the State of California has in all instances met the requirements set out in the first paragraph of section 4 (a) of said act of December 31, 1928, necessary to render said act effective, and so on, and so forth. That is the limitation act. So California is limited, therefore, to 4,400,000 acre-feet of the 8½ million acre-feet apportioned to the lower basin, and Nevada received 300,000 acre-feet, which left 3,800,000 acre-feet of the 8½ million acre-feet for use in Arizona and parts of Utah and New Mexico, which are in the lower basin.

Mr. WHITE. What happens if the water is deficient and does not flow?

Mr. CARSON. What is that, sir?

Mr. WHITE. Suppose there is not that much water.

Mr. CARSON. I think we will never have that situation, sir, and if it did happen, then, under this plan they would cut down in proportion, under my construction of it. However, I do not think it will ever do that, because it is far in excess of that amount.

Mr. WHITE. Mr. Chairman, I think it is very essential that someone place in this record, so that we will have at some place in this record, a record of the full and complete rights on the Colorado River as determined by the several States.

Chairman MURDOCK. That has already been inserted.

Mr. WHITE. We do have in the record now also the flow of the Colorado River as determined by the appropriate Federal bureau?

Chairman MURDOCK. That has also been inserted in the record.

Mr. WHITE. Do you have the flow by years?

Chairman MURDOCK. That has been put in.

Mr. WHITE. I want the minimum flow, where the water is so measured, and the maximum flow for the last 10 years, and I would like to know if that is available in this record.

Chairman MURDOCK. Those are already inserted, or, if not, I will direct that they be inserted for we must have those physical facts.

Mr. WHITE. What is the maximum annual flow?

Mr. CARSON. I do not know that it has been worked out yet in this record.

Mr. Baker called attention to the table in the report of the Bureau of Reclamation.

Mr. ROCKWELL. Mr. Baker's figure was 16,271,000 acre-feet.

Mr. WHITE. I want the minimum and the maximum flow.

Mr. BAKER. I will work that out for you.

Mr. CARSON. I think we can get that worked out.

Mr. WHITE. Can you put that in, Mr. Baker? I think it would be very essential to have that as a part of this testimony.

Mr. BAKER. I will do so.

Mr. ROCKWELL. For the last 15 years I think it has been running about 4,000,000 feet less than that. The only question is that we may not be able to do as much in the upper basin as we planned.

In other words, the upper basin people probably cannot use these 7½ million acre-feet that they thought they were reserving for themselves.

Mr. WHITE. Let us suppose we come down to 7,500,000 acre-feet per year.

Mr. ROCKWELL. Yes. What would happen, then?

Mr. WHITE. You have given us the figure, I believe, of 16,271,000 acre-feet.

Mr. ROCKWELL. 16,271,000 acre-feet has been the average for the last 46 years, which is twice as much as is needed.

Mr. WHITE. Certainly that is twice as much as is needed. On the other hand, in the last 15 years has there been a change in the situation?

Mr. ROCKWELL. Would it be possible, because of Colorado and other upper basin States, not availing themselves of the full amount?

Mr. WHITE. I think it is a good question as to whether they are, myself. I will put the question: Would it be possible, because Colorado, New Mexico, and other upper basin States are not availing themselves of the full flow to which they are entitled? Is it possible for them to use all of it that they are not now utilizing?

Mr. Baker, can you answer that?

Mr. ROCKWELL. I think that was the basis of Mr. Dowd's statement; to show that if we had been using 7½ million acre-feet for the last 15 years, there would be about 1½ million more acre-feet per year shortage. And we would have to restrict ourselves that much per year. On the other hand, we are only using 2½ million acre-feet in the four upper-basin States at the present time, which would have us available for some development in the four upper-basin States but not enough.

Mr. WHITE. Under the terms of the contract, half of the deficiency will fall on California and half of it on Arizona?

Mr. CARSON. So far as the Mexican treaty is concerned—and we have to take that into consideration, also—let me develop that a little bit. Under the compact, article 3 (d), the upper States agree to deliver to Lee Ferry 75,000,000 acre-feet over each 10-year period reckoned in consecutive series so that the lower basin is under all conceivable circumstances entitled to count on 7½ million acre-feet average, which will be 7½ million acre-feet per year for use in the lower basin. These figures that Mr. Baker has put in, and those that Mr. Rockwell has put in, are based upon the flow at Lee Ferry. Assuming that the upper basin used 7½ million feet this would show there is no additional storage needed, so far as this project is concerned. There is ample storage available at Boulder Dam to take care of this flow, and of this additional 600,000 acre-feet, and leave a considerable amount due to Arizona still in the river under

any possible theory of the construction of this California contention, in Lake Mead created by the Boulder Dam itself.

So that under any construction of it, or under no consideration, could this amount of water added to what other water now is used in Arizona, could there in any way be any infringement upon the 4,400,000 acre-feet California is entitled to receive. The total we are now using on all projects—you mentioned priorities; I do not have the relative priorities between these projects that Mr. Baker spoke of, but all the projects and priorities in Arizona now utilizing Colorado River water out of the main stream, total only 407,000 acre-feet. This project for 600,000 acre-feet, and if California could by any way try to increase the normal consumptive use in the lower basin under their figures, it would be not more than 1,000,000 acre-feet consumptive use, and there would still be plenty of water.

In other words, it boils down to this, no matter how California goes about this thing, so long as they stay within the most outermost regions of the California Limitation Act, there will be plenty of water, and there would be a surplus even beyond that.

Mr. WHITE. The test would be if every State used their full portion, California to use its full portion under its limitation, there would be a comparable situation on which we might consider the issue. There is probably another contention here. As to the residue, which would include Arizona along with the rest.

Mr. CARSON. Yes; on the over-all plan, but I have not heard any statement about that, and California has not made any claim that this 600,000 acre-feet for the Wellton-Mohawk-Mesa project could interfere with their use.

Mr. WHITE. There is another element, the 1,500,000 acre-feet that is being delivered to Mexico?

Mr. CARSON. That is correct.

Mr. WHITE. A reduction of the waters available for use in the United States by that amount, so if there is a deficiency in the upper basin or lower basin, then you would have to prorate their share of such a shortage?

Mr. CARSON. Yes. We have taken care of that, and still there is no possibility of this project interfering with California, under her limitation act.

Mr. WHITE. I think that is a very definite statement you have made there, sir.

Chairman MURDOCK. Mr. Rockwell, do you have anything to add to that?

Mr. ROCKWELL. I just want to say, Mr. Chairman, that I think you told a very good story. We had a lawyer at home who only wanted to hear one side of the case, because when he heard both sides it confused him. When Mr. Carson gets on the stand he convinces me, and when Mr. Dowd gets on the stand I am on the other side. Mr. Carson, I would like to go over these figures and see where I am wrong.

There are 8,500,000 acre-feet of water in the lower basin.

Mr. CARSON. That is correct, sir.

Mr. ROCKWELL. There are 4,400,000 acre-feet that go to California?

Mr. CARSON. That is correct.

Mr. ROCKWELL. Four hundred thousand feet go to Nevada, Utah, and New Mexico?

Mr. CARSON. That is correct.

Mr. ROCKWELL. Three million seven hundred thousand acre-feet are available for Arizona. What happens to the surplus?

Mr. CARSON. I can tell you, and then I think I can tell you where the difficulty arises.

We took the other figures. You took the surplus figures of Mr. Dowd. We took the other figure, 3,800,000 acre-feet for Arizona, and from that figure we deducted for use in those portions of Utah and New Mexico, parts of which are in the lower basin, 131,000 acre-feet for their use and prospective use in Utah and New Mexico. They are in the lower basin, within that definition.

Mr. ROCKWELL. You get the same result?

Mr. CARSON. We get the same result, but we figure it a little bit differently.

Mr. ROCKWELL. From Mr. Baker's statement the other day I take it these figures show that there was no use or prospective use of the 1,500,000 acre-feet for your Central Valley project.

Mr. CARSON. Just how is that, sir?

Mr. ROCKWELL. Let me get those figures again before me.

From Mr. Baker's statement I take it that these figures show that there was in use, or in prospective use, 1,500,000 acre-feet for the Central Valley; 1,000,000 acre-feet for the Gila project; 407,000 acre-feet for the five little projects down

here; 600,000 acre-feet for this project we are talking about, namely, the Yuma Mesa-Wellton-Mohawk; then we add in there 317,000 acre-feet losses from reservoirs; and that makes a total of 3,569,000 acre-feet of water, not accounting for the probability of having to get 750,000 acre-feet to Mexico which breaks the thing up again.

What is wrong with my figures? Where have I missed a point? This is apparently a little more than 3,700,000 acre-feet, and I think I got those figures from Mr. Baker.

Mr. CARSON. I think I had better let the answer come from Mr. Baker, then. If you got them from him, perhaps he would be a better man to explain them to you than I.

Mr. BAKER. I could not follow you there, sir, I am afraid. Perhaps if I could discuss with you off the record, I could show you what figures I have, and you can show me the figures you have, and we could work the thing out.

Chairman MURDOCK. While you are doing that, I do want to go into a few matters here.

If I understand the philosophy that appears from the West in Congress, and those interested in reclamation, it is this: That we out West, where reclamation prevails, are very jealous of State rights and control of water by the States; that we have given up a portion of that right in developing the Colorado River in this case going to the United States Government, the control of water stored in Lake Mead, but otherwise we are virtually maintaining our State control over the use of waters; "yes" or "no" on that?

Mr. CARSON. Yes, sir. May I add a little to that, if I may, Mr. Chairman?

Chairman MURDOCK. Certainly, you may do so.

Mr. CARSON. As to this water stored in Lake Mead, we cannot get at it except by contract with the Secretary of the Interior, then Mr. Ickes, but once we do get it out then the State laws relative to priority of use within the State again take hold.

Chairman MURDOCK. Now, one more statement: I want to say this for the benefit of my friend here from Idaho, Mr. White, who led me to believe that he does think under the right of State control of waters it would be possible to take water out of the rivers to use in some place in Arizona. Now, I want to remind my friend from Idaho that there are seven States in the Colorado River Basin, six of them being full-grown States prior to 1910, and no doubt were diverting water along the river, but when Arizona became a State, as a condition of statehood, she was required to pinch herself off from the Colorado River by a border of public lands.

Mr. WHITE. It related to water rights.

Chairman MURDOCK. Yes. To have irrigation in Arizona we have to get at the water, but we have to have the authority to do so from the Federal Government. This is a legal fact of paramount importance.

Mr. WHITE. As a practical matter, the water of a State belongs to every citizen of that State until it is appropriated, and the States themselves composed of the citizens of the State devise and pass certain laws that confer the right of the citizen to avail themselves of the water rights and proceed to appropriate it. Then the right of that water user becomes superior to the right of the other inhabitants.

Mr. CARSON. That is correct.

Chairman MURDOCK. Yes.

Mr. WHITE. That is the reason I am asking here that the secretaries of the three States furnish us a list of the existing water rights; that is, those recognized, the ones that are presently valid. Any excess of water covered by these water rights stored in Lake Mead, the Government has the authority to contract, or was given the authority to deliver to these contractors in consideration of their contribution to repay the cost of the Boulder Dam project, and have the water diverted to them. Let us stop a moment at that point.

Where is that authority to be found?

Mr. CARSON. That is section 5 of the act. But we have listed here in this table 3 of Mr. Baker's all of the use in Arizona—existing and planned—at this time of water of the main stream of the Colorado River.

Mr. WHITE. Does that include State water rights?

Mr. CARSON. Yes; it has come out of our share of the main stream water to supply the existing rights.

Mr. WHITE. It has cost this individual Member of Congress $3,000 to find out something about water rights in a law-suit, and that has made me sensitive to the matter.

Mr. CARSON. Our contract with the Secretary provides for the delivery to persons in Arizona, including all existing rights of 2,800,000 acre-feet, less these minor deductions, and then the State law steps in and protects the private users in the order of their priority.

Mr. WHITE. How do you propose to appropriate water from the Colorado River without covering it by a filing with the Secretary for the use of the Colorado River water?

Mr. CARSON. We will have to get a contract with the Secretary of the Interior after this act is passed. Then, after we have made arrangements with the Secretary for the irrigation of the Yuma Mesa-Wellton-Mohawk project, whenever the limits of the land to be irrigated are determined, the irrigation district will then file with the State orders and applications for that water.

Mr. WHITE. You are just anticipating a little? You are going to anticipate making a contract with the Secretary for the utilization of this water, the appropriation of water of the Colorado River? You are anticipating the right you will obtain by the State filings?

Mr. CARSON. Yes; and they will be filed in ample time. We cannot, as I understand it, by acts of the legislature or otherwise, set up these things other than in that way, without upsetting our water code. In other words, that will be the odrerly course of procedure, as I understand it.

Mr. WHITE. Other than the authority of the law to make filings on the Colorado River?

Mr. CARSON. To make filings on the Colorado River; yes.

Mr. WHITE. But you have to have some intent to make the filing, and that has to be evidenced?

Mr. CARSON. Yes; and you have to show the source of the water, and you can show the source of the water at Lake Mead and not until you can get arrangements worked out with the Secretary. In other words, you cannot show the source of the water of Lake Mead until you have an arrangement worked out with the Secretary that you can get that water. I think that, of course, is obvious.

Chairman MURDOCK. I want to point out again that the State of Arizona differs from the other basin States: it is the only State out of these seven Colorado Basin States that has this condition in its water supply from the river because of our not having free access to the Colorado River. I am not going to let that fact be overlooked on such bills as this.

Mr. Rockwell, do you have some comment to make on that now?

Mr. ROCKWELL. I might say that Mr. Baker had a table that he had apparently used before I came which gives the same results that I have worked out. In others words, if and when the three projects were all built, all the water that Mr. Baker feels Arizona is entitled to will be used.

Mr. CARSON. I think that is satisfactory, sir.

Mr. FARMER. I would like to make a statement here.

I might state another angle of this matter, because I am the sponsor of this particular bill; I am responsible for this particular Wellton-Yuma Mesa-Mohawk bill.

Mr. WHITE. And you are from the great State of Arizona?

Mr. FARMER. I certainly am.

Chairman MURDOCK. Should this come in here or should it come at the opening of our session tomorrow?

BRIEF OF THE COLORADO RIVER BASIN STATES COMMITTEE REPRESENTING THE STATES OF WYOMING, COLORADO, NEW MEXICO, ARIZONA, AND UTAH IN OPPOSITION TO S. J. RES. 145, NOW PENDING IN THE SENATE, AND TO H. J. RES. 225, 226, 227, AND 236 AND H. R. 4097, NOW PENDING IN THE HOUSE OF REPRESENTATIVES OF THE 80TH CONGRESS

The Colorado River Basin States Committee:
State of Colorado: Clifford H. Stone, Chairman; Frank Delaney.
State of Wyoming: L. C. Bishop, H. Melvin Rollins.
State of Utah: W. R. Wallace, Grover A. Giles.
State of New Mexico: Fred E. Wilson, John H. Bliss.
State of Arizona: Nellie T. Bush, Charles A. Carson.

I

INTRODUCTORY STATEMENT OF FACTS

On July 3, 1947, there was introduced in the Senate of the 80th Congress by Senator McCarran, for himself and the other Senator from Nevada and the Senators from California, S. J. Res. 145, which reads as follows:

[S. J. Res 145—80th Cong., 1st sess.]

"IN THE SENATE OF THE UNITED STATES

"July 3 (legislative day, April 21), 1947.

"Mr. McCarran (for himself, Mr. Downey, Mr. Knowland, and Mr. Malone) introduced the following joint resolution; which was read twice

"July 8 (legislative day, July 7), 1947

"Referred to the Committee on Public Lands

"JOINT RESOLUTION TO AUTHORIZE COMMENCEMENT OF AN ACTION BY THE UNITED STATES TO DETERMINE INTERSTATE WATER RIGHTS IN THE COLORADO RIVER

"Whereas the development of projects for the use of water in the Lower Colorado River Basin is being hampered by reason of long-standing controversies among the States in said basin as to the meaning and effect of the Colorado River compact, the Boulder Canyon Project Act, the Boulder Canyon Adjustment Act, the California Limitation Act (Stats. Cal. 1929, ch. 16), various contracts executed by the Secretary of the Interior with States, public agencies, and others in the Lower Basin of the Colorado River, and other documents and as to various engineering, economic, and other facts: Now, therefore, be it:

"*Resolved by the Senate and House of Representatives of the United States of America in Congress assembled*, That for the purpose of avoiding a multiplicity of actions and expediting the development of the Colorado River Basin, the Attorney General is hereby directed to commence in the Supreme Court of the United States of America, against the States of Arizona, California, Nevada, New Mexico, and Utah, and such other parties as may be necessary or proper to a determination, a suit or action in the nature of interpleader, and therein require the parties to assert and have determined their claims and rights to the use of water of the Colorado River system available for use in the Lower Colorado River Basin."

Similar proposals were made in the House of Representatives.

It will be observed that although the Resolution purports at the beginning thereof only to "*authorize*" the commencement of the action, it winds up by "directing" the commencement of the action. In other words, the proponents of the Resolution realized that a mere authorization would not suffice, because if the Attorney General is convinced that the rights of the United States in the Colorado River are being jeopardized by the lower basin States of the Colorado basin, or any of the States of the Basin, the Attorney General is not only authorized to bring such an action, but it is his duty to do so, which duty it is presumed he will perform, and consequently there would be no necessity for a mere authorization. The effect of the Resolution then is to direct the Attorney General to bring the action irrespective of whether he determines there is any legal basis for it or not. This poses the question as to whether the legislative branch of the Government should substitute its judgment as to the necessity for legal action, for that of the executive officer charged with the responsibility of determining such matters.

It will also be observed that the recitals of the Resolution, the basis of fact for it, state that the reason for the bringing of the suit or action is not that there is any long standing, or any controversy between the United States and the States of the lower basin States, or any of the States of the Basin, but that there are long standing controversies only among the States in the lower Colorado River Basin as to the meaning and effect of the Colorado River Compact, the Boulder Canyon project Act, the Boulder Canyon Adjustment Act, the California Limitation Act, various contracts executed by the Secretary of the Interior with States, public

agencies and others in the lower Basin of the Colorado River, and other documents, and as to various engineering, economic and other facts. What would be the conclusion from this statement of facts, assuming them all to be true? Obviously no other than that the meaning and effect of these documents should be judicially determined.

But those responsible for this Resolution were well aware of the fact that the Supreme Court of the United States, in the exercise of its original jurisdiction, will not render declaratory judgments, and, accordingly, the Resolution goes beyond the Recitals upon which it is based and directs that the Attorney General shall bring an action against the States of "Arizona, California, Nevada, New Mexico, and Utah, and such other parties as may be necessary or proper," which would include, though not specifically named, the other States of the Basin, namely, Colorado and Wyoming, not that the meaning and effect of the recited documents and other "facts" be determined, but that the rights to the use of water of the Colorado River system available for the lower Colorado River Basin be determined.

In order to make that determination, it would, of course, be necessary to determine the rights of all of the Basin States to the use of the water of the Colorado River, and so the necessary effect of the Resolution and the contemplated suit or action would be to throw the entire river into litigation before the Supreme Court and, as specifically stated in the Resolution, to "require" all of the Basin States named in the Resolution, as well as those included without being named to "assert" and have determined their rights to the use of the water of the River.

It will further be observed that not only does the Resolution direct that a suit or action be brought against the States named and those necessarily included, but it directs the form of action that the Attorney General shall bring. It is not an interpleader action, because those responsible for the Resolution were aware that such a suit or action could not be brought. They knew full well that in such an action the moving party, that is, the United States, would have to allege that it has no interest in the fund in its possession, in this case the River, and the United States could not allege that it has no interest in the River, and so it is to be, not a real interpleader action, but a suit or action "in the nature of an interpleader action." This raises the question as to why all this circumlocution. Is it because California and Nevada realize they have no real genuine present controversy between themselves, or either of them, against the other Basin States, or any of them, which would enable them to bring a suit or action in the Supreme Court of the United States, in the exercise of its original jurisdiction, as they have a constitutional right to do if they, or either of them, have such a controversy, and seek by means of "a suit or action by the United States against the States named or contemplated in the nature of an interpleader action" to give color to jurisdiction by the Court, which it would otherwise not have? In other words, if California or Nevada has a real genuine presently existing controversy with any of the Colorado River Basin States, why does not that State, or the two jointly, bring a suit or action in the Supreme Court of the United States to determine such controversy? Why do they or either of them, request that the United States be required to bring suit or action against them and the other States?

Finally, it will be observed that the Resolution is "for the purpose of avoiding a multiplicity of suits and expediting the development of the Colorado River Basin." Why its adoption and the bringing of the action or suit contemplated will avoid a multiplicity of suits and how such action will expedite the development of the Colorado River Basin (by which it must be assumed is meant the entire Basin, not merely the lower Colorado River Basin) is not stated. The assertion that a multiplicity of suits will be avoided is undoubtedly made because those who are responsible for the Resolution have in mind that some equitable ground must be stated to give color to the claim that the Court would have jurisdiction of the suit or action "in the nature of an interpleader" since they concede that a real interpleader action cannot be brought. This poses the question, what are the multiple suits that are to be avoided? And the statement that the action proposed "will expedite the development of the Colorado River Basin" raises the question as to whether in fact it will have that effect.

After this Resolution had been introduced and similar proposals made in the House of Representatives, the Colorado River Basin States Committee, an organization composed of official representatives of all the Colorado River Basin States, but from which California and Nevada had previously withdrawn, at a meeting held at Salt Lake City adopted the following Resolution:

"RESOLUTION RE M'CARRAN BILL ADOPTED BY COLORADO RIVER BASIN STATES COMMITTEE AT SALT LAKE CITY, UTAH, OCTOBER 1, 1947

"Be it resolved by the Colorado River Basin States Commitee representing the States of Arizona, Colorado, New Mexico, Utah, and Wyoming, and open to the States of California and Nevada, in meeting assembled in Salt Lake City, Utah, this first day of October 1947:

"That, Whereas, after thorough discussion, this Committee is of the opinion that the Resolution introduced in the Senate of the United States by Senator McCarran, Downey, Malone, and Knowland, S. J. Res. 145, which purports to be intended to authorize litigation over Colorado River Waters is unwise, in that no litigation is necessary for the reason that California's rights to water of the Colorado River are clearly defined and forever limited by the California Limitation Act (Chapter 16, California Statutes, 1929) to 4,400,000 acre-feet of apportioned water, plus not more than one-half of the surplus: No, therefore, be it

"*Resolved*, That this Committee opposes S. J. Res. 145 and urges its defeat; and be it further

"*Resolved*, That the Chairman and Secretary of this Committee are requested to send copies of this Resolution to the Chairman of the Subcommittee on Irrigation and Reclamation of the Public Lands Committee of the Senate of the United States, and also to send copies of this Resolution to the Chairman of the Judiciary Committee of the House of Representatives of the United States, to the Secretary of the Interior, to the Commissioner of the Bureau of Reclamation, and to our Congressional delegations, and to take any and all means necessary or advisable to bring to the attention of any Committees which may consider said S. J. Res. 145, or any similar resolution, the action taken by this Committee."

Subsequently at a meeting of the Committee held at Denver, Colorado, a subcommittee of representatives of the five states was appointed to take such measures as are proper to carry out the purpose and intent of the foregoing Resolution of the Committee. This Brief, then, in opposition to the adoption of Joint Resolution 145 (and similar proposals in the House of Representatives) is written in behalf of the States of Colorado, Wyoming, New Mexico, Arizona, and Utah, pursuant to the foregoing action taken by the Colorado River Basin States Committee, and to answer the questions developed by the foregoing analysis of the Resolution and in answer to the Brief of the States of California and Nevada in support of the Resolution heretofore filed in the Department of Justice, hereinafter referred to as the "California-Nevada Brief."

Before proceeding further with argument with respect to these matters, for the sake of clarity, we deem it proper to state certain physical facts connected with the Colorado River, and briefly to state the contents of certain of those documents recited in the Resolution, and commonly spoken of as the law of the river.

The Colorado River rises in the State of Colorado, flows through the northwestern portion of that State into the Southeastern part of Utah, where it is joined by the Green River, one of its principal tributaries, which rises in the State of Wyoming, and by the San Juan River, another of its principal tributaries, which rises in Colorado and flows through the Northwestern part of New Mexico. The Colorado River then flows into the Northern part of the State of Arizona, thence in a westerly direction until it reaches and forms the boundary between the States of Arizona and Nevada, continues in a southerly direction, still forming the boundary between these two states, thence still in a southern direction, forming the boundary between the States of Arizon and California, where it is joined by the Gila River, another of its principal tributaries, then in a southerly direction into Mexico and there empties into the Gulf of California. The River has many other tributaries which it is not deemed necessary to mention here.

Althought the documents, which it is commonly said constitute the law of the Colorado River, are named in the Resolution, there contents are not disclosed so as to make evident what controversies, of long standing, or otherwise, it could be claimed exist as to their meaning and effect. For that reason, and the reason that their summarization will go far, as we conceive, to determine whether there is or can be any dobut as to their meaning, we deem it proper briefly to state their contents.

The Colorado River Compact is, of course, the fundamental document, because all subsequent legislation, compacts, and contracts relating to the River are necessarily limited by its provisions, whether therein expressly so stated or not and generally they expressly so state. It had three prime purposes, (1)

to make an equitable division and apportionment of the use of the water of the Colorado River System, defined in the Compact to be that portion of the River and its tributaries within the United States of America, so as "to remove causes of present and future controversies" (2) "to establish the relative importance of different beneficial uses of water," and (3) to protect the rights of the United States as to the River. It defines the term "Colorado River Basin" as "all of the drainage area of the Colorado River System, and all other territory within the United States of America to which the waters of the Colorado River System shall be beneficially applied." It divides the States of the Basin into two Divisions, the States of the "Upper Division," namely, Colorado, New Mexico, Utah, and Wyoming, and the States of the "Lower Division," namely, Arizona, Nevada, and California, and the States of the Basin are divided in another way as between the "Upper Basin" which includes "those parts of the States of Arizona, Colorado, New Mexico, Utah, and Wyoming within and from which waters naturally drain into the Colorado River System above Lee Ferry, and also all States located without the drainage area of the Colorado River System which are now or shall hereafter be beneficially served by waters diverted from the system above Lee Ferry." (The crossing of the Colorado River known as Lee Ferry is in Arizona and is defined in the compact as "a point in the main stream * * * one mile below the mouth of the Paria River," one of the tributaries of the Colorado River, and the "Lower Basin" which includes "those parts of the States of Arizona, California, Nevada, New Mexico, and Utah within and from which waters naturally drain into the Colorado River System below Lee Ferry, and also all parts of said states located without the drainage area of the Colorado River System which are now or shall hereafter be beneficially served by waters diverted from the system below Lee Ferry.")

It is further provided that the term "domestic use" shall include the use of water for household, stock, municipal, mining, milling, industrial, and other like purposes, but shall exclude the generation of electrical power.

The Compact then proceeds in Article III to divide the water and is quoted in full, except subparagraph (g), which merely provides the method for the further apportionment provided in subparagraph (f), and it is not deemed necessary to state its contents herein, as follows:

"ARTICLE III. (a) There is hereby apportioned from the Colorado River system in perpetuity to the Upper Basin and to the Lower Basin, respectively, the exclusive beneficial consumptive use of 7,500,000 acre-feet of water per annum, which shall include all water necessary for the supply of any rights which may now exist.

"(b) In addition to the apportionment in paragraph (a), the Lower Basin is hereby given the right to increase its beneficial consumptive use of such waters by one million acre-feet per annum.

"(c) If, as a matter of international comity, the United States of America shall hereafter recognize in the United States of Mexico any right to the use of any waters of the Colorado River System, such waters shall be supplied first from the waters which are surplus over and above the aggregate of the quantities specified in paragraphs (a) and (b); and if such surplus shall prove insufficient for this purpose, then the burden of such deficiency shall be equally borne by the Upper Basin and the Lower Basin, and whenever necessary the States of the Upper Division shall deliver at Lee Ferry water to supply one-half of the deficiency so recognized in addition to that provided in paragraph (d).

"(d) The States of the Upper Division will not cause the flow of the river at Lee Ferry to be depleted below an aggregate of 75,000,000 acre-feet for any period of ten consecutive years reckoned in continuing progressive series beginning with the first day of October next succeeding the ratification of this compact.

"(e) The States of the Upper Division shall not withhold water, and the States of the Lower Division shall not require the delivery of water which cannot reasonably be applied to domestic and agricultural uses.

"(f) Further equitable apportionment of the beneficial uses of the waters of the Colorado River System unapportioned by paragraphs (a), (b), and (c) may be made in the manner provided in paragraph (g) at any time after October first, 1963, if and when either Basin shall have reached its total beneficial consumptive use as set out in paragraphs (a) and (b)."

It is not deemed essential for the purposes of this Brief to quote any of the other provisions of the Compact, except to say that Subparagraph (a) of Article IV recites that the Colorado River has ceased to be navigable for commerce, and the reservation of its water for navigation would seriously limit the development of its basin, the use of its waters for purposes of navigation shall be subservient

to the uses of such waters for domestic, agricultural, and power purposes, and Subparagraph (b) of that Article, which reads as follows:

"Subject to the provisions of this compact, water of the Colorado River System may be impounded and used for the generation of electrical power, but such impounding and use shall be subservient to the use and consumption of such water for agricultural and domestic purposes and shall not interfere with or prevent use for such dominant purposes."

Article VII, which reads as follows:

"Nothing in this compact shall be construed as affecting the obligations of the United States of America to Indian tribes."

and Article VIII, which reads as follows:

"Present perfected rights to the beneficial use of waters of the Colorado River System are unimpaired by this compact. Whenever storage capacity of 5,000,000 acre-feet shall have been provided on the main Colorado River within or for the benefit of the Lower Basin, then claims of such rights, if any, by appropriators or users of water in the Lower Basin against appropriators or users of water in the Upper Basin shall attach to and be satisfied from water that may be stored not in conflict with Article III.

"All other rights to beneficial use of waters of the Colorado River System shall be satisfied solely from the water apportioned to that basin in which they are situate."

It is important to note that because of the topographical situation and because of the obligations of delivery of the water at Lee Ferry, a distinction is drawn between the "Upper Division" and the "Lower Division" of States, and between the "Upper" and "Lower" Basin States, with the result that a part of Arizona is in the Lower Basin and a part thereof in the Upper Basin, and a part of New Mexico is in the Upper Basin and a part in the Lower Basin, and a part of Utah is in the Upper Basin and a part in the Lower Basin.

The Colorado River Compact has now been ratified by the Congress and by all of the Basin States, and is binding alike upon the United States and each and all of said States. Indeed, so far as the United States is concerned, the Congress, before it was approved, was fully cognizant of all its interests involved. Herbert Hoover (who represented the United States on the Compact Commission, and who was its Chairman), in his letter of transmittal of the Compact to the Speaker of the House of Representatives, fully set forth the interests of the United States in the River as follows:

"(1) Its interest in the Colorado River as a navigable stream.
"(2) Its relation with the Republic of Mexico.
"(3) Its interest as proprietor of public lands and as owner of irrigation works.
"(4) Its duties in relation to Indian tribes.
"(5) Its interest under the Federal water power act."

and discussed them at length, concluding with his opinion that the Compact does not adversely affect any interest of the United States. When Congress ratified the Compact, then, with full knowledge of its interests involved, it must be presumed to have determined that all of its interests were amply protected by the Compact.

Recently, and postdating all the documents referred to in the Resolution, the Mexican Treaty which the Compact contemplated would be entered into, as above set out, has been entered into.

It is not necessary to set out all the terms thereof, because in the California and Nevada Brief, those States explicitly make no claim that the whole or any part thereof affects their rights in the River; it is only necessary to state the amount of water to which Mexico is entitled to receive from the Colorado River. In that regard the Treaty in Article 10 allots to Mexico—

"(*a*) A guaranteed annual quantity of 1,500,000 acre-feet (to be delivered in accordance with certain conditions and specifications as to point and rate).

"(*b*) Any other quantities arriving at the Mexican points of diversion, with the understanding that in any year in which, as determined by the United States section, there exists a surplus of waters of the Colorado River in excess of the amount necessary to supply users in the United States and the guaranteed quantity of 1,500,000 acre-feet annually to Mexico, the United States undertakes to deliver to Mexico * * * additional waters of the Colorado River system to provide a total quantity not to exceed 1,700,000 acre-feet a year. Mexico shall

acquire no right * * * by use of the waters of the Colorado River System for any purpose whatsoever, in excess of 1,500,000 acre-feet annually.

"In the event of extraordinary drought or serious accident to the irrigation system in the United States, thereby making it difficult for the United States to deliver the guaranteed quantity of 1,500,000 acre-feet a year, the water allotted to Mexico under subparagraph (a) of this article will be reduced in the same proportion as consumptive uses in the United States are reduced."

The Boulder Canyon Project Act is the next document referred to in the Resolution (Act of December 21, 1928, c 42, 45 Stat. 1057, U. S. C. A. 43, Paragraph 617 and succeeding subdivisions thereof). That Act authorizes the construction of the dam now called the Hoover Dam (Act of April 30, 1947, c. 46, 61 Stat. 561, See note, U. S. C. A. 43, Paragraph 617) and the reservoir created thereby, since known as Lake Mead, and a main canal located entirely in the United States, connecting the Laguna Dam, or other suitable diversion dam, which diversion dam is now known as Imperial Dam, and which canal is now known as the Imperial Canal, with Imperial and Coachella Valleys. In addition to providing for the dam's construction and the reservoir created thereby, so far as is material here, it provided that the Act should not take effect until the State of California by act of its legislature, "shall agree irrevocably and unconditionally with the United States and for the benefit of the States of Arizona, Colorado, Nevada, New Mexico, Utah, and Wyoming, as an express covenant and in consideration of the passage of the Act, that the aggregate annual consumptive use (diversions less returns to the river) of water of and from the Colorado River for use in the State of California, including all uses under contracts made under the provisions of the Act, and all water necessary for the supply of any rights which may now exist (December 21, 1928) shall not exceed four million four hundred thousand acre-feet of the waters apportioned to the lower-basin States by paragraph (a) of Article III of the Colorado River Compact, plus not more than one-half of any excess or surplus water unapportioned by said compact, such uses always to be subject to the terms of said Compact."

The Act further provides that "the Secretary of the Interior is hereby authorized, under such general regulations as he may prescribe, to contract for the storage of water in said reservoir and for the delivery thereof at such points on the River and on said canal as may be agreed upon, for irrigation and domestic uses, and generation of electrical energy and delivery at the switchboard to States, municipal corporations, political subdivisions, and private corporations of electrical energy generated at said dam," * * *.

It is not deemed necessary to recite the terms of the Boulder Canyon Project Adjustment Act, next referred to in the Resolution, because it does not affect any of the matters herein discussed, nor is it necessary to set out any of the provisions of the California Limitation Act (Stats. California 1929, Ch. 16), except to say that it complies precisely with the conditions set out in the Boulder Canyon Project Act, nor is it necessary to set out any of the various contracts executed by the Secretary of the Interior and referred to in the Resolution, except to say that each and all of them are specifically made subject to the terms of the Colorado River Compact, and the Boulder Canyon Project Act, and to state that the contract entered into between the Department of the Interior and the State of Arizona limits the amount of consumptive use of the Colorado River by Arizona to 2,800,000 acre-feet per annum, and the contract with the State of Nevada limits its consumptive use to 300,000 acre-feet per annum, the total aggregate of which, together with the 4,400,000 acre-feet per annum to which California is limited by the Boulder Canyon Project Act, and her acceptance of that limitation by the California Limitation Act, is the amount of water allocated to the Lower Basin States by the above quoted Article III, Subparagraph (a) of the Colorado River Compact.

These statements are pertinent and will become more pertinent as we proceed, as bearing upon the administrative construction of the Colorado River Compact by the United States through the Department of Interior, particularly with relation to the 1,000,000 acre-feet of water per annum referred to in Article III (b), as being additional to the 7,500,000 acre-feet per annum allocated by Article III (a) to the Upper and Lower Basin States. In other words, the question arises as to why this total is 7,500,000 feet if in administering the Act the Secretary of the Interior construed that any of the Lower Basin States other than Arizona had any interest in the 1,000,000 acre-feet metioned in Article III (b) commonly spoken of as "III (b) water."

It is not necessary for the purposes of this Brief to state any other facts, except

to say that at the present time none of the Colorado River Basin States, including the States of Nevada and California, have approached the consumptive use of the water of the Colorado River apportioned to it by the Colorado River Compact. In fact, so far as the State of California is concerned, it is not now using in excess of 3,000,000 acre-feet, and the State of Nevada is using only a very small portion of the 300,000 acre-feet allocated to it. And there is flowing into Mexico a large amount of water in excess of the 1,500,000 acre-feet of water per annum to which it is entitled; indeed, the total is approximately 8,000,000 acre-feet per annum.

III

ARGUMENT

1. The jurisdiction of the Supreme Court, in the exercise of its original jurisdiction, so far as material for our consideration, extends only to justiciable controversies between the United States and one or more States, and to controversies between two or more States.

Article III, Section 2, of the Constitution of the United States provides, so far as material here, "The judicial power shall extend to * * * controversies to which the United States shall be a Party;—to controversies between two or more States." That section further provides "In all cases * * * in which a State shall be a party, the Supreme Court shall have original jurisdiction."

The Supreme Court of the United States has had occasion frequently to pass upon the meaning of the foregoing constitutional provisions in suits or actions between States, and to fix the limits of its jurisdiction thereunder. It has held that it will not grant relief against a State unless the complaining State shows an existing or presently threatened injury of serious magnitude (*Missouri* v. *Illinois*, 200 U. S. 496, 521; *New York* v. *New Jersey*, 256 U. S. 296, 309; *North Dakota* v. *Minnesota*, 263 U. S. 364, 374; *Connecticut* v. *Massachusetts*, 282 U. S. 660, 669; *Alabama* v. *Arizona*, 291 U. S. 286, 291; *Washington* v. *Oregon*, 297 U. S. 517, 528).

A potential threat of injury is insufficient to justify an affirmative decree against a state. The Court will not grant relief against something feared as liable to occur at some future time (*Alabama* v. *Arizona*, 291 U. S. 286, 291).

The rule that judicial power does not extend to the determination of abstract questions has been announced in numerous cases (*Ashwander* v. *Tennessee*, 297 U. S. 288, 324; *New York* v. *Illinois*, 274 U. S. 488; *U. S.* v. *West Virginia*, 295 U. S. 463).

For there to be a justiciable controversy it must appear that the complaining state has suffered a loss through the action of the other state, furnishing a claim for judicial redress, or asserts a right which is suceptible of judicial enforcement according to the accepted principle of jurisprudence (*Massachusetts* v. *Missouri*, 308 U. S. 1, 16). The mere fact that a state is plaintiff is not enough (*Florida* v. *Mellon*, 273 U. S. 12, 16). An injunction will issue to prevent existing or presently threatened injuries but will not be granted against something merely feared as liable to occur at some indefinite time in the future (*Connecticut* v. *Massachusetts*, 282 U. S. 660, 674). The Court has repeatedly said that it will not issue declaratory decrees (*Arizona* v. *California*, 283 U. S. 423, 473; *United States* v. *West Virginia*, 295 U. S. 463, 474; *Alabama* v. *Arizona*, 291 U. S. 286, 291; *Massachusetts* v. *Missouri*, 308 U. S. 1, 15). Inchoate rights dependent upon possible future development furnish no basis for a decree in an interstate suit (*Arizona* v. *California*, 283 U. S. 423, 462).

In discussing this constitutional provision the Court said in *Texas* v. *Florida* (306 U. S. 398, 405, 59 S. Ct. 563):

"So that our constitutional authority to hear the case and grant relief turns on the question of whether the issue framed by the pleadings constitutes a justiciable 'case' or 'controversy' within the meaning of the constitutional provision, and whether the facts alleged and found afford an adequate basis for relief according to the accepted doctrines of the common law or equity systems of jurisprudence, which are guides to decision of cases within the original jurisdiction of this Court."

Many years earlier in *Louisiana* v. *Texas* (176 U. S. 1, 15, 20 S. Ct. 251), the Court declared:

"But it is apparent that the jurisdiction is of so delicate and grave a character that it was not contemplated that it would be exercised save when the necessity was absolute and the matter in itself properly justiciable."

The Court will not grant relief against something feared as liable to occur

at some fuutre time. In *Alabama* v. *Arizona* (291 U. S. 286, 291, 54 S. Ct. 399), it was said:

"This Court may not be called upon to give advisory opinions or to pronounce declaratory judgment * * *. Its jurisdiction in respect of controversies between states will not be exerted in the absence of absolute necessity."

In the New River Case (*U. S.* v. *Appalachian Electric Power Co.*, 311 U. S. 377, 432) the Court said:

"To predetermine, even in the limited field of water power, the rights of different sovereignties, pregnant with future controversies, is beyond the judicial function."

So far we have cited all the leading cases between States decided by the Supreme Court of the United States, in which the question of the existence of a justiciable controversy wthin the Court's jurisdiction was raised, except four, of which three will now be considered, and the fourth, *Arizona* v. *California* (298 U. S. 558), which is cited in the last of the three cases will be considered later herein. The first is the case of *Kansas* v. *Colorado* (206 U. S. 46) in which the Court said "that the appropriation of the waters of the Arkansas by Colorado, for purposes of irrigation, has diminished the flow of water into the state of Kansas; that the result of that appropriation has been the reclamation of large areas in Colorado, transforming thousands of acres into fertile fields, and rendering possible their occupation and cultivation when otherwise they would have continued barren and unoccupied; that while the influence of such diminution has been of perceptible injury to portions of the Arkansas Valley in Kansas, particularly those portions closest to the Colorado line, yet, to the great body of the valley it has worked little, if any, detriment, and regarding the interests of both states, and the right of each to receive benefit through irrigation and in any other manner from the waters of this stream, we are not satisfied that Kansas has made out a case entitling it to a decree. At the same time it is obvious that if the depletion of the waters of the river by Colorado continue to increase there will come a time when Kansas may justly say that there is no longer an equitable division of benefits, and may rightfully call for relief against the action of Colorado, its corporation and citizens, in appropriating the waters of the Arkansas for irrigation purposes."

The bill of Kansas was dismissed without prejudice to its right to institute new proceedings "whenever it shall appear that through a material increase in the depletion of the waters of the Arkansas by Colorado, its corporations, or citizens the substantial interests of Kansas are being injured to the extent of destroying the equitable apportionment of benefits between the two States resulting from the flow of the river." In other words, the Court said that at the time of bringing the suit, Kansas had failed to show any existing substantial injury, and that there must be, to give the Court jurisdiction, and that the fact there might come a time when there would be such injury is not sufficient, but when that time came, and then only, could Kansas bring her suit.

Subsequently Colorado brought a suit against Kansas (320 U. S. 383), to protect it and its citizens in the beneficial use of the waters of the Arkansas River as determined by the former decree of the Court. Kansas answered and in its answer claimed that Colorado users had largely increased their appropriations and diversions and threatened to increase them, "to (as the Court put it) the material damage of Kansas' substantial interests." The Court said:

"In such disputes as this, the court is conscious of the great and serious caution with which it is necessary to approach the inquiry whether a case is proved. Not every matter which would warrant resort to equity by one citizen against another would justify our interference with the action of a state, for the burden on the complaining state is much greater than that generally required to be borne by private parties. Before the court will intervene the case must be of serious magnitude and full and clearly proved. And in determining whether one state is using, or threatening to use, more than its equitable share of the benefits of a stream, all the factors which create equities in favor of one state or the other must be weighed *as of the date when the controversy is mooted.*" [Italics ours.]

The Court concluded that Kansas had not sustained her allegation that Colorado had materially increased her use of the River and that such increase had worked a serious detriment to the substantial interests of Kansas.

The case of *Nebraska* v. *Wyoming* (325 U. S. 588), involving the North Platte River, is the latest case in which the question of jurisdiction was raised. Colorado in that case claimed that she was not injuring Nebraska, because there was

a surplus of water in the River, but the Court denied the motion, and in doing so said:

"What we have then is a situation where three States assert against a river, whose dependable natural flow during the irrigation season has long been over appropriated, claims based not only on present uses but on projected additional uses as well. The various statistics with which the record abounds are inconclusive in showing the existence or extent of actual damage to Nebraska. But we know that deprivation of water in arid or semiarid regions cannot help but be injurious. That was the basis for the apportionment of water made by the Court in *Wyoming* v. *Colorado*, supra (259 U. S. 419). In that case no jurisdictional question was raised. There the only showing of injury or threat of injury was the inadequacy of the supply of water to meet all appropriative rights. As much if not more is shown here. If this were an equity suit to enjoin threatened injury, the showing made by Nebraska might possibly be insufficient. But *Wyoming* v. *Colorado*, supra, indicates that where the claims to the water of a river exceed the supply a controversy exists appropriate for judicial determination. If there were a surplus of unappropriated water, different considerations would be applicable. Cf. *Arizona* v. *California* (298 U. S. 558, 80 L. Ed. 1331, 56 S. Ct. 848). But where there is not enough water in the river to satisfy the claims asserted against it, the situation is not basically different from that where two or more persons claim the right to the same parcel of land. The preesnt claimants being States we think the clash of interests to be that character and dignity which makes the controversy a justiciable one under our original jurisdiction."

Three judges dissented, because they did not consider that the facts disclosed any present injury which would justify the court assuming jurisdiction.

We have considered these cases in detail, not that any new principle is announced in them. On the contrary, the same principle is reaffirmed in them all, including this latest decision, namely, there must be a present existing controversy between the partes. If that exists, it suffices, although it may be strengthened if in addition, there is a threatened additional injury, as in the last case, the construction of the Kendrick dam in Wyoming, which had been authorized by Congress.

The question, then, is whether the facts as to the Colorado River bring it within the case of *Nebraska* v. *Wyoming* or *Kansas* v. *Colorado;* in other words, whether there is any present controversy of such a character relating to the River that the Supreme Court will assume jurisdiction of it.

It will be observed that all the cases cited involve claimed controversies between States except one, namely, the *United States* v. *West Virginia*, cited supra. However, the language in the Constitution is precisely the same with respect to the jurisdiction of the Court in suits between States and those between the United States and a State, and consequently the Court holds precisely the same in both classes of suits. The following language from the case is pertinent:

"But there is presented here, as respects the State, no case of an actual or threatened interference with the authority of the United States. At most, the bill states a difference of opinion between the officials of two governments, whether the rivers are navigable and, consequently whether there is power and authority in the federal government to control their navigation, and particularly to prevent or control the construction of the Hawkes Nest Dam, and hence whether a license of the Federal Power Commission is prerequisite to its construction. There is no support for the contention that the judicial power extends to the adjudication of such differences of opinion. Only when they become the subject of controversy in the constitutional sense are they susceptible of judicial determination. See *Nashville, C. & St. L. R. Co.* v. *Wallace* (288 U. S. 249, 259, 77 L. ed. 730, 733, 53 S. Ct. 345, 87 A. L. R. 1191). Until the right asserted is threatened with invasion by acts of the State, which serve both to define the controversy and to establish its existence in the judicial sense, there is no question presented which is justiciable by a federal court. See *Fairchild* v. *Hughes* (258 U. S. 126, 129, 130, 66 L. ed. 499, 504, 505, 42 S. Ct. 274); *Texas* v. *Interstate Commerce Commission* (258 U. S. 158, 162, 66 L. ed. 531, 537, 42 S. Ct. 261); *Massachusetts* v. *Mellon*, supra (262 U. S. 483, 485, 67 L. ed. 1063, 1084, 43 S. Ct. 597); *New Jersey* v. *Sargent*, supra (269 U. S. 328, 339, 340, 70 L. ed. 289, 294, 295, 46 S. Ct. 122).

"General allegations that the State challenges the claim of the United States that the rivers are navigable, and asserts a right superior to that of the United States to license their use for power production, raise an issue too vague and ill-

defined to admit of judicial determination. They afford no basis for an injunction perpetually restraining the State from asserting any interest superior or adverse to that of the United States in any dam on the rivers, or in hydroelectric plants in connection with them, or in the production and sale of hydroelectric power. The bill fails to disclose any existing controversy within the range of judicial power. See *New Jersey* v. *Sargeant*, supra (339, 340)."

The Resolution, as heretofore herein pointed out, not only instructs the Attorney General to bring a suit, but it specifies the particular form of the suit. It is to be one in the nature of an interpleader, thus expressly conceding as is done in the Nevada-California Brief, that a bill in interpleader would not lie, because the United States cannot say it has no interest in the Colorado River. As shown by the Nevada-California Brief, the proponents of the Resolution seized upon the decision of the Supreme Court in the case of *Texas* v. *Florida* (306 U. S. 398). The proponents, we think, have done exactly what Justice Frankfurter in his dissenting opinion, in which Justice Black concurred, predicted would be done. He said:

"The authority which the Constitution has committed to this Court over 'Controversies between two or more States,' serves important ends in the working of our federalism. But there are practical limits to the efficacy of the adjudicatory process in the adjustment of interstate controversies. The limitations of litigation—its episodic character, its necessarily restricted scope of inquiry, its confined regard for considerations of policy, its dependence on the contingencies of a particular record, and other circumscribing factors—often denature and even mutilate the actualities of a problem and thereby render the litigious process unsuited for its solution. Considerations such as these have from time to time led this Court or some of its most distinguished members either to deprecate resort to this Court by States for settlement of their controversies (see *New York* v. *New Jersey*, 256 U. S. 296, 313, 65 L. ed. 937, 945, 41 S. Ct. 492), or to oppose assumption of jurisdiction (see Mr. Chief Justice Taney in *Pennsylvania* v. *Wheeling & B. Bridge Co.*, 13 How. 518, 579, 592, 14 L. ed. 249, 274, 280, in connection with the Act of August 31, 1852 (10 Stat. at L. 112, Chap. 112) and *Pennsylvania* v. *Wheeling & B. Bridge Co.*, 18 How. 421, 15 L. ed. 435; Mr. Justice Brandeis in *Pennsylvania* v. *West Virginia*, 262 U. S. 553, 605, 67 L. ed. 1117, 1135, 43 S. Ct. 658, 32 A. L. R. 300)."

He further said:

"Jurisdictional doubts inevitably lose force once leave has been given to file a bill, a master has been appointed, long hearings have been held, and a weighty report has been submitted. And so, were this the last as well as the first assumption of jurisdiction by this Court of a controversy like the present, even serious doubts about it might well go unexpressed. But if experience is any guide, the present decision will give momentum to kindred litigation and reliance upon it beyond the scope of the special facts of this case. To be sure, the Court's opinion endeavors to circumscribe carefully the bounds of jurisdiction now exercised. But legal doctrines have, in an odd kind of way, the faculty of self-generating extension. Therefore, in picking out the lines of future development of what is new doctrine, the importance of these issues may make it not inappropriate to indicate difficulties which I have not been able to overcome and potential abuses to which the doctrine is not unlikely to give rise."

In that case the State of Texas, claiming the right to impose death taxes on the estate of the decedent Green because of his domicile in that State, brought a suit against the States of Florida, New York, and Massachusetts, alleging that each of them made similar claims to that of Texas, the total of which would exceed the assets of the estate after paying the Federal estate tax, and that suits might be brought in the other States which would be binding upon the estate, and bring about the entire depletion as to whether the Court had jurisdiction of the cause and answered its own query as follows:

"The peculiarity of the strict bill of interpleader was that the plaintiff asserted no interest in the debt or fund, the amount of which he placed at the disposal of the court and asked that the rival claimants be required to settle in the equity suit the ownership of the claim among themselves. But as the sole ground for equitable relief is the danger of injury because of the risk of multiple suits when the liability is single (*Farley* v. *Blood*, 30 N. H. 354, 361; *Bedell* v. *Hoffman*, 2 Paige, 199, 200; *Mohawk & H. River R. Co.* v. *Clute*, 4 Paige, 384, 392; *Atkinson* v. *Manks*, 1 Cow. 691, 703; *Story*, Eq. Pl. 10th ed. Secs. 291, 292), and as plaintiffs who are not mere stakeholders may be exposed to that risk, equity extended its jurisdiction to such cases by the bill in the nature of interpleader. The essential of the bill in the nature of interpleader is that it calls upon the court

to exercise its jurisdiction to guard against the risks of loss from the prosecution in independent suits of rival claims where the plaintiff himself claims an interest in the property or fund which is subjected to the risk. The object and ground of the jurisdiction are to guard against the consequent depletion of the fund at the expense of the plaintiff's interest in it and to protect him and the other parties to the suit from the jeopardy resulting from the prosecution of numerous demands, to only one of which the fund is subject. While in point of law or fact only one party is entitled to succeed, there is danger that recovery may be allowed in more than one suit. Equity avoids the danger by requiring the rival claimants to litigate before it the decisive issue, and will not withhold its aid where the plaintiff's interest is either not denied or he does not assert any claim adverse to that of the other parties, other than the single claim, determination of which is decisive of the rights of all." (Citing cases.)

"When by appropriate procedure, a court possessing equity powers is in such circumstances asked to prevent the loss which might otherwise result from the independent prosecution of rival but mutually exclusive claims, a justiciable issue is presented for adjudication which, because it is a recognized subject of the equity procedure which we have inherited from England, is a 'case' or 'controversy' within the meaning of the Constitutional provision; and when the case is one prosecuted between states, which are the rival claimants, and the risk of loss is shown to be real and substantial, the case is within the original jurisdiction of this Court conferred by the Judiciary Article." (Citing cases.)

It is impossible to conceive how there could from any point of view under the situation presented as to the Colorado River, be a multiplicity of suits which is the only ground upon which the jurisdiction of the Court was predicated in the case of *Texas* v. *Florida*. Whatever suit be brought, and by either the United States or a State, any State whose rights are affected would either be parties or would have to voluntarily appear to protect their interests therein, and so there would be only the one suit. But we prefer to rest our opposition to the resolution upon a more fundamental basis, namely, that there is no existing justiciable controversy between the United States and the States of the Lower Colorado Basin, or any State in it or in the entire Basin, which would enable the Attorney General to invoke the original jurisdiction of the Supreme Court, because if there is no such controversy that fact would prevent the bringing of the suit, whatever the form of action.

2. There is no present justiciable controversy between the United States and the Colorado River Basin States, or any of them, or between any of said States.

It will not be disputed that the adoption of the Resolution by the Congress will not give the Court jurisdiction which the Constitution does not vest in the Court, for as illustrated in the opinion in the case of *Texas* v. *Florida*, supra, the Court itself will determine whether it has jurisdiction.

We may assume, we take it, that the California-Nevada Brief states the case as strongly for the proponents of the Resolution as it could be stated, and the only claim made therein is that "Arizona is asking the Secretary of the Interior to approve S. 1175 (the Central Arizona Project, which would entail the delivery of over 1,000,000 acre-feet of water from Lake Mead) now pending before the Congress.

Well, what of it? Suppose the Secretary of the Interior is of opinion S. 1175 should be enacted, or that it should not be, or is doubtful about the matter or has no opinion at all. Does that opinion rise to the dignity of an existing justifiable controversy? Obviously not, and his opinion is precisely in the same category as the opinions in the case of *United States* v. *West Virginia*, which the Court held did not rise to the dignity of a controversy, because whatever be his opinion, he can take no action until the Congress acts. It may act unfavorably on the bill, then there could be no controversy even at that time, much less now. Suppose it should act favorably, and the bill should become law, would the United States then want to become the moving instrumentality by which California might assert that Congress should not have passed the law? We submit not. It should require California to move to assert its right by bringing an action against Arizona, and assert that it was being injured in its rights by virtue of the authorized project. In view of the fact that California is not now using, and will not probably at that time be using the entire quantity of water, the right to which is allocated to her by the Colorado River Compact, the Boulder Canyon Project Act, and the California Limitation Act, namely, 4,400,000 acre-feet per annum, it is doubtful that California could state a justiciable controversy between her and the State of Arizona, but if she could then there is no reason why she should not bring the action. But, California will say, as is said

in the California-Nevada Brief, that she can't bring such an action, because the United States would be an indispensable party to the suit, and without its consent the United States cannot be sued, and in support of that contention relies upon the case of *Arizona* v. *California et al.* (298 U. S. 558).

In that case Arizona sought to file a bill of complaint against California and the other basin states to have "the quantities of Arizona's equitable share of water flowing in the Colorado River fixed * * * and that petitioner's title thereto be quieted." All of the defendants filed motions to dismiss upon the ground, amongst others, that the United States was an indispensable party. The Court, however, did discuss the question as to whether the bill, which asked that Arizona's share in the future of the unappropriated water of the River be determined, stated a justiciable controversy, which is the reason why the Court in the case of *Nebraska* v. *Wyoming, supra*, referred to this case in the above-quoted portion of the opinion as follows:

"If there were a surplus of unappropriated water, different consideration would be applicable." Cf. *Arizona* v. *California.*

In other words, in the case of *Nebraska* v. *Wyoming*, the sole basis of the Court's decision that it had jurisdiction to determine the rights of the States in the North Platte River was that there was not enough water in he River at the time the suit was brought to satisfy the existing rights of the interested States in the River—that is what made a justiciable controversy, but where, as in the case of the Colorado River there is at this time a surplus over and above the present rights of the users, there cannot now be a justiciable controversy.

But the reason why this case is important, in this particular phase of our discussion is whether, assuming that the Central Arizona Project has been authorized, and assuming that at that time California and Nevada could state a justiciable controversy in a suit against Arizona, would the United States be an indispensable party? It will be noted that in such a suit the issues would be limited to whether Arizona on the one side and California and Nevada on the other have as between them certain rights in the River, and under such circumstances it would not seem that the United States would be an indispensable party, as the Court held was the case in the cited case, because in that case to determine what her future rights would be as against all the other States and the United States, all the States and the United States would be indispensable parties. But if it should be determined otherwise, all that California would be entitled to ask at that time is that the United States consent to be sued, not that in advance of those contingencies the United States initiate litigation that would throw the whole River in litigation.

On April 5th of this year the Supreme Court of the United States rendered a decision in the case of *Peggy Shade*, a full-blood Cherokee Indian, Roll No. 14147, v. *Lucy Downing, Now Foster, Nancy Downing, Now Taylor, and Polly Downing, Now Williams* (68 S. Ct. 702) which clearly points out the circumstances under which the United States is an indispensable party. This case was before the Court on Certificate from the United States Circuit Court of Appeals from the Tenth Circuit, and was an action to determine the heirship of a Cherokee Indian. In that case the Supreme Court referred to a case entitled "*United States* v. *Hellard*" (322 U. S. 363, 365), as follows:

"We held in *United States* v. *Hellard*, supra, that the United States is a necessary party to partition proceedings brought under Section 2 of that Act. That holding was based upon the direct and important interests of the government in the course and outcome of partition proceedings, interests flowing from the statutory restrictions on alienation of allotted lands. Lands partitioned in kind to full-blood Indians remain restricted under Section 2. Thus the United States, as guardian of the Indians, is directly interested in obtaining a partition in kind, where that course conforms to its policy of preserving restricted lands for the Indians, or, if a sale is desirable, in insuring that the best possible price is obtained. Moreover, if the lands are both restricted and tax-exempt, it has an interest in the reinvestment of the proceeds of the sale in similarly tax-exempt and restricted lands (Act of June 30, 1932, 47 Stat. 474, 25 U. S. C., Sec. 409a). And there is a further interest in protecting the preferential right of the Secretary of the Interior to purchase the land for another Indian under Sec. 2 of the Act of June 26, 1936 (49 Stat. 1967). For these reasons we held in *United States* v. *Hellard*, supra, that the United States was a necessary party to the partition proceedings, even absent a statutory requirement to that effect.

"Heirship proceedings, however, present quite different considerations. They involve no governmental interests of the dignity of those involved in partition

proceedings. Restrictions on alienation do not prevent inheritance (*United States* v. *Hellard*, supra, p. 365). Death of the allottee operates to remove the statutory restrictions on alienation and the determination of heirship does not of itself involve a sale of land. The heirship proceeding involves only a 'determination of the question of fact as to who are the heirs of any deceased citizen allottee of the Five Civilized Tribes.' As such, it is little more than an identification of those who by law are entitled to the lands in question and does not directly affect the restrictions on the land or the land itself. Important as these proceedings may be to the stability of Indian Land titles, they are of primary interest only to the immediate parties. The United States is, indeed, hardly more than a stakeholder in the litigation.

"That is the distinction between partition and heirship proceedings which we recognized in *United States* v. *Hellard*, supra (365–366). We adhere to it. Accordingly the question certified is answered 'No'."

This is pertinent in the present situation for two reasons. First, an action between the State of California and the State of Arizona which only involves the rights between them is not such an action that requires the United States to be made party, and, secondly, the doctrine announced in the *Hellard* and *Shade* cases means that, no matter what the form of action, in the *Hellard* case it was an action in partition, the United States in order to invoke the jurisdiction of the Supreme Court must have a direct and immediate interest in the controversy, or, in other words, it must state a justicable controversy and there is not, and cannot be, as we have pointed out, any present justiciable controversy between the United States and any of the Basin States.

As we have shown there is not only now no controversy between the United States and all or any of the Colorado River Basin States suggested by the California-Nevada Brief, but there are in fact none, nor could there be, because those rights were protected in the Colorado River Compact, as herein heretofore in our preliminary statement of facts pointed out and they are not and could not be now questioned by any of the Basin States.

And here, so far as the legal phases of the problem are concerned, the Brief might end were it not for the fact that the California-Nevada Brief claims certain disputes to exist between those States and the State of Arizona, and that because of them the United States should bring the suit contemplated by the Resolution. As we have already argued, such disputes would not justify such a suit by the United States as is contemplated by the Resolution even if such disputes were of such a character as to constitute them justiciable controversies, but we also say that none of them are of such a character.

The California-Nevada Brief states that "no problems requiring present disposition are believed to exist between the 'Upper and Lower Basin'." This is a cautious statement. It implies that in the future California and Nevada may be able to dig up some, but it suffices to show what is the fact, that there are no existing justiciable controversies between the two Basins. That lets out all of Colorado and Wyoming and those portions of Arizona, Utah, and New Mexico in the "Upper Basin." The Brief says "No specific question is known to exist relative to the claims of Nevada, Utah, and New Mexico." Here again the same caution. But it suffices because it lets out the rest of Utah and New Mexico. and that is the fact, because those portions of Utah and New Mexico must receive their water out of the 2,800,000 acre-feet allocated to Arizona by the contract between the United States and that State, and there is no controversy between Utah and New Mexico and Arizona on that score.

It also lets out Nevada, so the question arises as to why Nevada joins California in proposing the Resolution and joins in the Brief. Notwithstanding they contradict the earlier statement, this is attempted to be answered by three later paragraphs of the Brief, which out of the 73 pages of the Brief set forth Nevada's claims. In them it is again stated that Nevada's share of water—the 300,000 acre-feet contracted for between the United States and Nevada—have never been questioned by either California or Arizona yet "Nevada is seriously concerned as to the effect of political processes upon the stimulation of projects and development in the other States, with consequent repercussions as to Nevada's allotment." If that is a definition of what constitutes a present justiciable controversy, then all the decisions of the Supreme Court cited above will have to be reversed.

Then follows the one and only claim of grievance which Nevada asserts, and again it is that same S. 1175, which is California's sole grievance, that Congress

may authorize the Central Arizona Project. Nevada is concerned because, as the Brief says, that project contemplates the operation of a power plant at the proposed Bridge Canyon Dam (located immediately above Lake Mead), and its operation will have the effect of reducing the power available to Nevada at the Hoover Dam, from which Nevada gets its power under contract with the United States through the Secretary of the Interior, and the project also contemplates "*ultimately*" diverting over a million acre-feet, which will reduce the quantity of water at Hoover Dam available for power purposes and thereby affect the quantity and cost of power to Nevada thereat. Our answer to the claim of Nevada is precisely the same as that already made to the claim of California with respect to S. 1175, heretofore herein set out, and which we do not think needs repeating here, except to add that, as pointed out in our preliminary statement of facts, under the Colorado River Compact, power is subservient to the right to use the water of the Colorado River for irrigation and domestic purposes, and therefore the incidental loss of water available for the generation of power by projects necessary for the uses of the States other than Nevada for irrigation and domestic uses is a matter as to which neither California or Nevada has a right to object, nor has either a right to anticipate that the Congress will authorize projects which will violate that Compact, which is binding alike upon the United States as well as all the States parties to it.

The entire remainder of the California-Nevada Brief is devoted to claims exclusively between California and Arizona, and the conclusion is irresistible that those disputes are really all there are between any of the States in the Basin. They are stated to be three in number, exclusive "a variety of more or less minor or detailed divergencies of opinion," otherwise not specified in the Brief, which surely it could not be claimed rise to the dignity of a justiciable controversy. The first is as to what it meant by what is called in the Colorado River Compact "III (b) water," or the million acre-feet, which is in addition to the water allocated to the Lower Basin in III (a), an interest in which the Brief claims California did not renounce in its Limitation Act. Notwithstanding the language of the Compact, which to us clearly enough indicates that the 1,000,000 acre-feet is apportioned water, and notwithstanding that clarity is strengthened if it needed any strengthening by (c) of Article III, which refers to the contemplated Treaty with Mexico, and says Mexico's rights shall be supplied first from waters which are surplus over and above the water specified in (a) and (b), which places III (b) water along with (a) and (c) water in the water that is apportioned, and says that the unapportioned water is water other than (a), (b), and (c), and in spite of the fact that (f), which determines how unapportioned water is to be disposed of, (a) and (b) water are both referred to as apportioned water, California argues that the 1,000,000 acre-feet is unapportioned or surplus water.

It is to be noted that in the Brief (f) is referred to as relating to the waters which may be allocated to Mexico, but it does not. It relates to that water which is apportioned and that which is not.

The Brief commences the argument by saying: "In any event, the matter being one of contract law, we are concerned with the intent of the parties to the contract in the use of the words."

The brief then seeks to show that intent by quoting from the Report of Mr. Delph E. Carpenter, who was the Commissioner from Colorado, on the Commission which drafted the Compact, and various statements made by various Senators at a later date when the Boulder Canyon Project Act was before the Senate, and by quotations from the Brief of the attorneys for Arizona in the case of *Arizona* v. *California* (283 U. S. 423), none of which when examined will be found to sustain the contentions made in the Brief. But if we are to take the writers of the Brief at their word and we are to seek what is meant by "III (b) water," by evidence outside the instrument itself, which assumes that there is some ambiguity in that language, which, as we have already shown there is not, then the Brief omits the most significant evidence there is.

When the Compact was ready for signature Arizona refused to sign because she did not consider that she was protected in her rights in the Gila River, and so the provision as to "III (b) water," the million acre-feet was added. After it was signed, Herbert Hoover, who, as already stated, was Chairman of the Commission, wrote a letter to Mr. W. S. Norviel, the Commissioner representing Arizona, which reads as follows:

"DEPARTMENT OF COMMERCE

"OFFICE OF THE SECRETARY

"Washington

"LOS ANGELES, CALIF., *November 26, 1922.*

"Mr. W. S. NORVIEL,
"State Engineer, Phoenix, Ariz.

"MY DEAR NORVIEL: This is just by way of registering again my feelings of admiration for the best fighter on the commission. Arizona should erect a monument to you and entitle it 'One million acre-feet.'

"I am sending you herewith a photograph which does not purport to be a likeness but it is a better-looking fellow than the one you have, and I send it as an excuse for writing this letter expressing my personal appreciation of this fine association which we have had.

"Faithfully yours,

"HERBERT HOOVER."

The photograph of Mr. Hoover which he enclosed in the letter has this in his own handwriting "W. S. Norviel from Herbert Hoover in tribute to a million acre-feet and a fine associate."

Herbert Hoover has been charged with making many mistakes, but surely he did not make the mistake as claimed in the California-Nevada Brief of wanting to inscribe on a monument "One Million Acre-Feet" when it should have been "One-Half Million Acre-Feet." (Hearings before the Committee on Irrigation and Reclamation, House of Representatives, Seventy-ninth Congress, Second Session, on H. R. 5434, a Bill authorizing the Gila Federal Project and For Other Purposes, Part 2, July 8, 1946, Page 370.)

The argument then shifts to a consideration of the meaning of Section 4a of the Boulder Canyon Project Act, and California's Limitation Act, which the Brief claims shows that III (b) water is unapportioned. After providing in the first paragraph for the limitation by California to the use of 4,400,000 acre-feet per annum of the Colorado River water, the second paragraph reads as follows:

"The States of Arizona, California, and Nevada are authorized to enter into an agreement which shall provide (1) that of the 7,500,000 acre-feet annually apportioned to the lower basin by paragraph (a) of Article III of the Colorado River Compact, there shall be apportioned to the State of Nevada 300,000 acre-feet and to the State of Arizona, 2,800,000 acre-feet for exclusive beneficial consumptive use in perpetuity, and (2) that the State of Arizona may annually use one-half of the excess or surplus waters unapportioned by the Colorado River Compact, and (3) that the State of Arizona shall have the exclusive beneficial consumptive use of the Gila River and its tributaries within the boundaries of said State, and (4) that the waters of the Gila River and its tributaries, except return flow after the same enters the Colorado River, shall never be subject to any diminution whatever by any allowance of water which may be made by treaty or otherwise to the United States of Mexico but if, as provided in paragraph (c) of Article III of the Colorado River compact, it shall become necessary to supply water to the United States of Mexico from waters over and above the quantities which are surplus as defined by said compact, then the State of California shall and will mutually agree with the State of Arizona to supply, out of the main stream of the Colorado River, one-half of any deficiency which must be supplied to Mexico by the lower basin, and (5) that the State of California shall and will further mutually agree with the States of Arizona and Nevada that none of said three States shall withhold water and none shall require the delivery of water, which cannot reasonably be applied to domestic and agricultural uses, and (6) that all of the provisions of said tri-State agreement shall be subject in all particulars to the provisions of the Colorado River compact, and (7) said agreement to take effect upon the ratification of the Colorado River compact by Arizona, California, and Nevada."

In the light of what we have said at least from the point of view of the United States, this disposes of the contention of Nevada and California as to III (b) water, for (3) of the paragraph says that the "State of Arizona shall have the exclusive beneficial consumptive use of the Gila River within the boundaries of said state" and it explains why III (b) water was separated from III (a) water, a separation which disturbs the writers of the Nevada-California Brief if it is

apportioned water. It was because it had nothing to do with the division of water between the Upper and Lower Basin. It was Arizona's because the Gila River was Arizona's. But apart from all this argument as to III (b) water, it presents no present justiciable controversy between Arizona and California, because it does not jeopardize any of California's present use of the river's water. Indeed, the argument that III (b) water is unapportioned or surplus water goes too far. If it be such, then it is water which comes within III (f) and III (g) of the Compact, and thereby California agreed that there shall be no division of unapportioned or surplus water until after 1963 and then only "if and when either Basin shall have reached its total beneficial consumptive use, as set out in paragraphs (a) and (b)," which conclusively demonstrates there could be no justiciable controversy over such water at least until 1963.

Indeed, the question as to whether or not III (b) is apportioned water under the contract is set at rest by the decision of the United States Supreme Court in the case of *Arizona* v. *California* (292 U. S. 341 at page 742 of 54 St. Ct.) by the following statement of the Court:

"Sixth. The considerations to which Arizona calls attention do not show that theer is any ambiguity in article III (b) of the compact. Doubtless the anticipated physical sources of the waters which combine to make the total of 8,500,000 acre-feet are as Arizona contends, but neither article III (a) nor (b) deal with the waters on the basis of their source. Paragraph (a) apportions waters 'from the Colorado River system,' i. e., the Colorado and its tributaries, and (b) permits an additional use 'of such waters.' The compact makes an apportionment only between the upper and lower basin; the apportionment among the states in each basin being left to later agreement. Arizona is one of the states of the lower basin, and any waters useful to her are by that fact useful to the lower basin. But the fact that they are solely useful to Arizona, or the fact that they have been appropriated by her, does not contradict the intent clearly expressed in paragraph (b) (nor the rational character thereof) to apportion the 1,000,000 acre-feet to the states of the lower basin and not specifically to Arizona alone. It may be that, in apportioning among the states the 8,500,000 acre-feet allotted to the lower basin, Arizona's share of waters from the main stream will be affected by the fact that certain of the waters assigned to the lower basin can be used only by her; but that is a matter entirely outside the scope of the compact."

The next alleged dispute is stated to be "the charge against III (a) water on account of Gila uses." Says the Nevada-California Brief:

"The Gila River, in its lower reaches, was, in a state of nature, a wasting stream. In the last one hundred miles above the point where it disembogues in the Colorado, its bed is wide, sandy, flat, and subject to the intense heat of the desert. As a result, although an average of about 2,300,000 acre-feet of water per annum flows into the Phoenix area in Central Arizona from the mountainous watershed of the Gila and its tributaries, it has been estimated by the Bureau of Reclamation that, in a state of nature, before any water was put to use in Central Arizona, an average of only approximately 1,300,000 acre-feet per annum flowed from the Gila, at its mouth, into the Colorado. The rest was lost by evaporation, deep seepage, and transpiration. Arizona argues that it is chargeable, for its use of Gila water, only to the extent it 'depletes' the flow of the main stream of the Colorado below the quantity which would have flowed in it in a state of nature. California contends that that view is a distortion of the measure of charge specified in the compact, namely, 'beneficial consumptive use.' By construction of an extensive system of impounding reservoirs in the mountains east of Phoenix and batteries of pumps in the lowlands, Arizona projects have accomplished the capture and utilization of substantially all of the 2,300,000 acre-feet. All of that water supply is actually being beneficially and consumptively used in Arizona and produces crops. One way of expressing the problem is, therefore; 'Is a state or project entitled to salvage, by conversion works, water which in a state of nature was wasted, and not be charged under the compact for water so salvaged?'"

The short answer to this contention is, as we have already pointed out, this water in question is not III (a) water, but III (b) water, and that Arizona is entitled to all the water of the Gila River, and that therefore what is meant by "consumptive beneficial use" in the Compact becomes immaterial.

Indeed, from the point of the United States, 4a of the Boulder Canyon Project Act disposes of both the first and the second alleged disputes between Arizona and California. It not only says that the State of Arizona is entitled to the beneficial consumptive use of the Gila River. That takes care of the III (b), the million acre-feet. That also takes care of the definition of the term "beneficial

consumptive use in perpetuity." Then it says that Arizona is entitled to 2,800,000 acre-feet per annum "for exclusive beneficial consumptive use," which obviously is in addition to the Gila River. The United States is in no position, having by legislative enactment determined these matters and its administrative officers having acted thereon ever since, now to reverse that determination and to lend any aid to California or any other Basin State to try and change that determination.

Moreover, and here again, this is our fundamental answer, the interpretation of the meaning of the term, does not create any present justiciable controversy between California and Arizona even if it might in the future, because however it be interpreted, it does not jeopardize California's present use of the waters of the River.

The third claimed dispute between California and Arizona is whether California's 4,400,000 acre-feet per annum of the River is subject to its proportionate share of the losses in Lake Mead, as it is stated Arizona contends. In other words, does the 4,400,000 acre-feet per annum mean a "net limitation," or is it to be lessened by proportioned reservoir losses? Well, again, what of it? It may become important in the future, but it cannot be now, because whether it be 4,400,000 acre-feet net, or a lesser amount even by the 600,000 acre-feet suggested in the Brief as California's proportionate share of Lake Mead losses, California's present use of the water of the Colorado River is not in jeopardy.

Finally, what sort of disputes are these three claimed disputes? They are as to the meaning of certain provisions of the documents constituting the law of the River, which may or may not become important in the future but are not now, because they do not jeopardize any present use by California of the water of the River. They are, first: What is meant by "III (b)" water as used in the Compact? As to that, it is claimed Arizona has one opinion and California another. Second, what is the meaning of the term "beneficial consumptive use of water" as used in the Compact? As to that it is claimed the opinions of California differ from those of Arizona. Third, what is the interpretation to be given to the limit on California's use of the River, the 4,400,000 acre-feet per annum? California says that means without losses. Arizona says, so the Brief claims, it means subject to losses. This demonstrates that what California really wants is a definition of these words and terms for future guidance. That can only be done by agreement or by a declaratory judgment of a court. She knows that the Supreme Court has decided it will not render declaratory judgments in the exercise of its original jurisdiction because of the constitutional limitation upon it. She cannot bring an action or suit to have their meaning fixed. So, what she proposes is that the United States shall bring the suit or action and thus indirectly give color of jurisdiction which would otherwise not exist. We say that the attempt would eventually be futile, because color of jurisdiction does not suffice. It must be existent. We say that if the bill of complaint which was filed would state all the three claimed disputes of California against Arizona as stated in the Brief, and as we have shown that is all there is on the River, and then state the facts as to present use of the water of the River, and what is going to waste, it would not state a justiciable cause of action. If it went further, then it would state more than California has asked or has a right to ask.

This brings us to the questions of policy apart from the legal questions involved in the adoption of this Resolution. Should the United States for the supposed benefit of California, attempt to do for her what she can't do for herself, especially if it be to the detriment of the other States, as we shall now show it would be?

3. The Upper Colorado River Basin States are now negotiating a compact to allocate between them the waters apportioned to them by the Colorado River Compact. The allocation among the Lower Basin States is substantially settled by the law of the river.

As shown by the quotations hereinbefore made from decisions of the Supreme Court of the United States and the opinions of its judges, disputes between states, for the reasons better stated therein than we could state, should be settled by compact rather than by litigation before it.

The states of the Upper Basin, through a Compact Commission, are now engaged in an attempt to divide the waters allocated to them by the Colorado River Compact. The California-Nevada Brief says with respect to those negotiations "the Upper Basin States, Wyoming, Utah, Colorado, and New Mexico

91190—49—ser. 11, pt. 1——24

and, as to a trifling interest, Arizona, have for a year or more been engaged in negotiations for a compact to divide the upper basin water aming them. It is believed that this effort will be effectual." Whether California is sincere in this statement we shall later discuss, but it suffices now to state that we concur and, indeed, there is every reason to believe that before the end of the year such a compact will be entered into so as to submit the same to the interested states when their legislatures meet at the beginning of next year and to the Congress for ratification.

So far as the Lower Basin States are concerned, as we have already shown, the United States by the enactment of the Boulder Canyon Project Act has already determined that two out of the three principal contentions now made by California cannot be successfully made and that the United States cannot now countenance California making them. So far as the United States is concerned they are settled as fully and completely as if there were an express compact as to them between the Lower Basin States and the United States and between those states. By virtue of Section IV (a) of the Boulder Canyon Project Act these are:

"(1) That of the 7,500,000 acre-feet annually apportioned to the lower basin by paragraph (a) of Article III of the Colorado River compact, there shall be apportioned to the State of Nevada 300,000 acre-feet and to the State of Arizona 2,800,000 acre-feet for exclusive beneficial consumptive use in perpetuity, and (2) that the State of Arizona may annually use one-half of the excess or surplus waters unapportioned by the Colorado River compact, and (3) that the State of Arizona shall have the exclusive beneficial consumptive use of the Gila River and its tributaries within the boundaries of said State, and (4) that the waters of the Gila River and its tributaries, except return flow after the same enters the Colorado River, shall never be subject to any diminution whatever by any allowance of water which may be made by treaty or otherwise to the United States of Mexico."

As already pointed out, these provisions of IV (a) dispose completely of California's contention with respect to III (b) water and what is meant by the beneficial consumptive use of water so far as the Gila River is concerned. Taking into consideration that Arizona is entitled to all the use of the Gila River as set out in this paragraph, this necessarily means that Arizona is entitled in addition thereto to 2,800,000 acre-feet per annum which means, further, that there is ample water for the Central Arizona Project because California does not and cannot assert that that project will take more water than that. In other words, by virtue of Section IV (a) of the Boulder Canyon Project Act the United States has said to the Lower Basin States that these four items are so settled that there need be no compact concerning them, and if you do make any compact as to any other differences there may be between you, if any such exist, such compact must contain these provisions and be subject to these limitations. This so far as the Nevada-California brief is concerned, and as we have before stated, it must be assumed that that brief states as strongly as can be stated California's position, leaves only one dispute of any consequence as between California and Arizona, namely, whether California shall be required to bear its proportionate share of the evaporation loss in Lake Mead.

As we have already shown, that cannot now give rise to a justiciable controversy before the Court, and even if it could it would only be a dispute as between California and Arizona but, of course, it can now be settled by compact and such settlement would not in anywise affect the Central Arizona Project or any other project for the development of the Upper Colorado River so as to jeopardize the rights under the compact of those states. Surely, if the Upper States can settle their differences by the division of the water allotted to them under the compact, why can't Arizona and California settle this one remaining dispute between them? The California-Nevada brief says they can't, because Arizona refuses even to meet with Nevada and California, and in support of that statement have appended to the brief as appendices, certain letters passing between the Governors of the respective States. That the correspondence be complete, we attach the remainder of it. We submit that an analysis of the entire correspondence does not disclose a refusal by Arizona to meet, and that instead of trying to help California to air its disputes with Arizona by the adoption of the proposed Resolution in the Courts, the Congress should advise California and Nevada to do what the Supreme Court has advised be done, what the Upper Basin States are doing, namely to negotiate with respect to that one remaining dispute. If the States which formed the Union could resolve their differences by the adoption of the Constitution under which we live, surely Cali-

fornia and Arizona ought to resolve this one remaining difference of opinion between them by a compact authorized by that same constitution. The President and Congress by the enactment of the Boulder Canyon Project Act have pointed the way and fixed the manner of traveling it. (Section IV (a) hereinbefore quoted.) California does not like to travel that way but it would be inconsistent for the United States now not to insist that California follow it, especially, as litigation contemplated by the proposed Resolution will have the effect of greatly delaying the development of the Colorado River, and particularly in the Upper Basin as we shall now proceed to show.

4. The adoption of the proposed resolution will delay the development of the river.

In the opinion of Justice Frankfurter heretofore quoted, upon the filing of a bill of complaint in the Supreme Court, the practice of the Court is pointed out, and that practice is to appoint a Master or Commissioner to take the testimony which is usually voluminous and in its taking a long period of time is consumed. Then the Master or Commissioner has to make his Report and Findings and it is only then that the case comes to the Supreme Court for decision. The case of *Nebraska* v. *Wyoming* (325 U. S. 589), involving the North Platte River, was commenced in 1934, and was completed in 1945. The litigation over the Arkansas River was commenced in 1901 (*Kansas* v. *Colorado*, 206 U. S. 46, and *Colorado* v. *Kansas*, 320 U. S. 381), and ended in 1943. The Laramie River case was commenced in 1911 (*Wyoming* v. *Colorado*, 259 U. S. 419, 309 U. S. 572) and decided in 1940. The result of the adoption of the Resolution, and the commencement of the action, pursuant thereto, instead of expediting the development of the Colorado River Basin as claimed in the Resolution, will greatly delay it. The writer or writers of the California-Nevada Brief are cognizant of the long delays in water litigation between States in the Supreme Court of the United States, but they claim that the issues in this case will be merely "interpretations of statutes and other documents," and therefore this case will differ from all previous water litigations. That statement but reinforces our claim that that is the extent of their claims, that they want these statutes and documents now construed solely for future guidance. That they cannot do as the decisions of the Supreme Court stand now, because uniformly that Court has refused to render declaratory judgments. Apparently they have not the courage to ask the Supreme Court to reverse those decisions, and parenthetically we may say they have been criticized, and so they ask the United States to pull their chestnuts, which may exist sometime, although they do not now exist, out of the fire which is not yet burning. They hope that the Attorney General, if the Resolution passes, can camouflage an action to declare the meaning of certain "statutes and documents" into a justiciable controversy, or at least be the intermediary by which they will be able to do it. We submit it would be a breach of faith to all the other Basin States for the United States to lend California any aid or comfort in such an undertaking and to bring an action which would throw the rights of all the Basin States and of the United States in the River in litigation which it will take many years to conclude. In other words, the inconsistency of the Brief and the Resolution is this: The Brief claims that the disputes are confined to interpretations of instruments affecting only the rights in the River between Arizona and California. The Resolution attempts to put in issue all the claims of all the States. Meantime California will endeavor to use the water to which the other States are entitled and will oppose any projects of the Upper River, as she is opposing the Central Arizona project, including the Central Utah Project now pending in Congress (S. 2095, H. R. 5233), and we can now hear her reresentatives shout, "Why appropriate any of the money of the United States so needed for other projects to construct this project on the Colorado River when that River is in litigation before the Supreme Court of the United States, and it will be years and years before it will be determined whether there will be any water available for the project?" When reduced to the ultimate, this Resolution is nothing but a flank attack upon the Central Arizona Project. But it will undoubtedly be followed—if it is adopted that the contemplated suit is brought—by frontal attacks upon every project for the development of the River. Putting it bluntly, California, having already received all the major projects needed by her to enable her to use not only the water to which she is entitled, but an amount greatly in excess thereof, wants to be in a position to use those excess waters which the other Basin States are entitled to use but have not the facilities to enable them to so use.

Then, after she has used them, she will raise the cry that she must not be deprived of them because it will ruin the wondrous civilization which has been

builded upon their use. Indeed, this cry, while somewhat vague and feeble, is nevertheless audible in the Resolution and in the Brief. In the Resolution it is intimated "engineering, economic, and other facts" are factors to be considered in determining the rights of the Basin States in the River. In the Brief the immense amount of water involved is stressed. The number of people it will serve with domestic water is heralded—5,000,000 people. But vague and feeble though it now be, it will become a lusty yell once California is using water which really belongs to the other States for 5,000,000 people, or some such number. Thus. are the rights of the other States in the River to be sacrificed upon the altar of California's alleged economic needs? We submit the United States ought not to kindle the fire that will enable California to make that sacrifice and that is the purpose of the Resolution and will be its effect if it is adopted and pursuant to it, the suit is brought.

5. The adoption of the resolution will hamper the consummation and ratification of the compact between the Upper Basin States, and the failure of the Upper Basin States to enter into a compact will delay the development of the river.

As pointed out, the States of the Upper Basin are engaged in formulating a Compact which will divide the waters of the Colorado River to which they are entitled between those States. If the rights of all the Basin States are thrown into litigation, as provided for in the resolution, naturally of what use will it be for the Upper Basin States to continue their negotiations when their rights are in litigation? True it is, the Commissioners may be so confident that California's claims will ultimately be determined to be fanciful, to be distorted interpretations of words and phrases in documents, to be utterly unsound, as we are, and therefore will courageously proceed, but even should they do so, it would be practically impossible to procure ratification of any compact formulated, because it cannot be presumed that the members of the Legislatures will have the same convictions that the Commissioners have because of their years of studies of the questions.

So, if the Upper Basin States should fail to consummate a Compact, or if it should fail of ratification in any one State, there will be another excuse for delay in the development of the upper River, and again the United States will be adding fagots to California's sacrificial fire.

Why should the United States thus play into California's hands when none of its rights are in any jeopardy, when none of its rights are in any wise threatened by any Basin State, including California?

We respectfully submit that the United States should not; that the Department of the Interior should not recommend the adoption of the Resolution, involving as it does, the United States suing all the Basin States, not only for the reason that there are no rights of the United States involved or threatened, but because all of the contracts the Department has entered into have been based upon a denial of the only claims California has or can make, and in harmony with the second paragraph of 4a of the Boulder Canyon Project Act, and to take a different position now would be inconsistent; on the contrary to be consistent it should recommend that the Resolution be not adopted; that the Department of Justice should not recommend the adoption of the Resolution, because it must necessarily depend for its facts upon the Department of the Interior, because that Department is charged with the responsibility of determining them, and we submit that no facts can be furnished by the Department of the Interior that will show a present justiciable controversy between the United States and any of the States; that on the contrary, if it be convinced by both the California-Nevada Brief and this Brief, as we submit it must be, that the only controversy that exists is the difference of opinion between Arizona and California as to the meaning of the documents as set out in both briefs, the Department should recommend that the Resolution be not adopted, because the authority of the Attorney General's office to institute suits in behalf of the United States ought not to be used to give either California or Nevada the means of resolving such differences of opinion, but the burden of instituting such a suit should be cast upon the State asserting such differences, the Attorney General knowing full well he can intervene if he deems the interests of the United States involved, as he has done before in other suits; that the Congress should not adopt the Resolution and thereby instruct the Attorney General to bring a suit against all the Basin States, not only because the Congress would thereby determine for the Attorney General that there is a legal basis for the suit, when in fact none exists, but because it should not be the policy of the United States, when none of its own interests are involved, to take the side of one State in a dispute it has with

another, or with others, especially when as here, as we have shown, it will be to the disadvantage of the other State or States, and particularly when, as here, the State is making contentions contrary to what the Congress has determined by legislation, and contrary to the acts of the administrative officers of the United States pursuant to that legislation.

SUMMARY

The position of the Colorado River Basin States Committee, and of the States of Colorado, Wyoming, Utah, New Mexico, and Arizona, which are members of that committee, can be summarized thus:

1. Jurisdiction of the United States Supreme Court in controversies between states is determined by the constitution of the United States and may not be enlarged or diminished by act of Congress.

2. The Supreme Court has, by a long and consistent line of decisions, established the rule that a suit may not be maintained against a state by another state or by the United States unless the complainant has suffered or is immediately threatened with an injury of serious magnitude.

3. The proposed suit by the United States against certain Colorado River Basin states does not come within the stated rule because there is no injury or threat of injury. This conclusively appears from the following irrefutable facts:

(*a*) Every Colorado River Basin state is now using water in an amount substantially less than that to which it is fairly and equitably entitled under the documents which constitute the law of the river.

(*b*) No project has been constructed, is under construction, or has been authorized for construction in any state which threatens to diminish the supply of water which admittedly is available to each other state under the documents constituting the law of the river.

(*c*) Very large amounts of Colorado River water are flowing unused across the international boundary into Mexico and there is no claim that within the immediate future those amounts will be so substantially reduced as to interfere with the availability of water necessary to supply the admitted share of the proponents of the resolution.

(*d*) There is no suggestion of any projects for development of Colorado River water which might interfere with the claimed rights of any state except projects which are of such magnitude that federal financing is essential. Projects of that character must be authorized by Congress and financed by congressional appropriations. The availability of water for those projects is a proper concern for Congress when considering the necessary legislation. Under our constitution and applicable decisions of the Supreme Court, Congress cannot avoid that responsibility or obtain assistance by requesting declaratory or advisory opinions of the Supreme Court.

4. The Colorado River Basin States Committee, and the states composing that committee, affirm that they recognize as valid and binding instruments and legislation and as the law of the river the Colorado River Compact, the Boulder Canyon Project Act, the California Self-Limitation Act, the Boulder Canyon Project Adjustment Act, the Mexican Water Treaty of 1944, and the various water use contracts executed by the Secretary of the Interior. Any assertion to the contrary by the proponents of Supreme Court litigation is without foundation and constitutes a deliberate distortion of the truth.

5. It is reasonable to assume that any Supreme Court litigation, such as that proposed, will require a period of years before ultimate determination by the Court. The practice of the Court in interstate cases involving disputes as to facts is to appoint a master or commissioner for the taking of testimony. Experience has shown that this process is long-drawn-out and costly. Assertions to the contrary are misleading as they are based upon cases determined on objections to the filing of a bill. While the status of the pleadings in any litigation such as is proposed may not be forecast with any accuracy, it is reasonable to believe that there will be issues of fact. It is within the power of any state, including those states proposing this legislation, to create such issues of fact. There is and can be no assurance from the sovereign states involved, either individually or as a group, that factual questions will not be raised.

6. The effect of the proposed litigation can only result in delay in the development of the river. Congressional authorization of projects or appropriations for construction of projects will be contested upon the ground that until the decision of the Court the availability of a water supply is uncertain.

7. The consummation, ratification, and approval of a compact between the

states of the Upper Basin will be embarrassed and handicapped by the proposed litigation. The case, if filed, will raise questions as to the interpretation and applicability of the Colorado River Compact. A compact between the upper basin states must conform to the Colorado River Compact. The pendency of litigation over that basic compact will be used as the basis for arguments that an Upper Basin Compact should not be made while such litigation is pending. This will delay the development of the upper basin by federally financed projects as the Department of the Interior and the Bureau of the Budget have ruled that new federal projects will not be authorized in the upper basin until an allocation of the water available for use in the upper basin is made between the states located therein.

8. The proposed legislation is unnecessary as it must be assumed that the attorney general of the United States and the responsible officials of each state will do their duty and institute whatever litigation is necessary to protect the rights of their respective governments.

9. The assertion that the legislation is necessary because the United States is an indispensable party to litigation involving the issues presented is without merit because (a) the mere presence of the United States in the suit does not create a justiciable controversy, (b) there is no justiciable controversy and hence legislation giving the consent of the United States to suit is unnecessary, (c) if any state believes and can establish that it is being injured or threatened with injury by another state, a suit by such injured state may not be defeated by the assertion that the United States is an indispensable party and (d) whenever in the future some controversy, as yet undefined either as to issues or parties, arises and in connection with such litigation it is proper for the United States to be a defendant, then will be the time for Congress to give consideration to legislation involving consent to be sued therein.

10. Congress should not infringe upon the duties, rights, and prerogatives of the executive and judicial branches of the government of the United States by directing the institution and maintenance of unnecessary litigation. Congress can and should make its own determination as to each and every project submitted to it. If any state disagrees with such congressional determination, our constitution affords method of redress.

For the reasons assigned it is asserted that the proposed legislation does not merit favorable consideration.

Respectfully submitted.

The Colorado River Basin States Committee:

State of Colorado: Clifford H. Stone, Chairman; Frank Delaney.
State of Wyoming: L. C. Bishop, H. Melvin Rollins.
State of Utah: W. R. Wallace, Grover A. Giles.
State of New Mexico: Fred E. Wilson, John H. Bliss.
State of Arizona: Nellie T. Bush, Charles A. Carson.

Subcommittee to Oppose Litigation:

State of Utah: J. A. Howell, Chairman; Grover A. Giles.
State of New Mexico: Fred E. Wilson, Martin A. Threet.
State of Wyoming: Norman B. Gray, Attorney General; H. Melvin Rollins.
State of Colorado: Clifford H. Stone, Jean S. Breitenstein.
State of Arizona: Nellie T. Bush, Charles A. Carson.

APPENDIX

Correspondence between the Governor of California and the Governor of Arizona omitted from the California-Nevada Brief.

STATE OF CALIFORNIA,
GOVERNOR'S OFFICE,
Sacramento, May 16, 1947.

The Honorable SIDNEY P. OSBORN,
Governor of Arizona, Phoenix, Arizona.

DEAR GOVERNOR OSBORN: I did not bother you during the time you were ill in our State concerning my suggestions for settling the differences of opinion of Arizona and California regarding their respective rights to the use of the water of the Colorado River. However, now that you have recovered sufficiently to return to your home, I would like to discuss your letter of March 12, 1947, and the accompanying copy of your letter to William E. Warne, Acting Commissioner of the Bureau of Reclamation, dated November 22, 1946.

I gather from these two letters that you believe it is unnecessary to try to

write a compact between the lower-basin states or to have your respective claims arbitrated, because you consider the existing statutes, contracts, etc., have so settled the rights of Arizona, California, and Nevada in the Colorado River that there are no substantial differences between the states. It may well be that the suggestions of a compact and arbitration are not feasible at this late date, but I am of the opinion that there are such basic divergencies of interpretation of the statutes and documents mentioned above, particularly between Arizona and California, that without an authoritative determination as to which state is right, it is impossible for anyone to know what quantity of water either state is entitled to. If our states are to plan for their futures, they must know with certainty how much water is eventually to be made available to them, because everyone recognizes that there is not enough water in the river to fully serve the legitimate aspirations of both our states.

It seems to me that a suit in the Supreme Court of the United States, to which the lower-basin states and the United States are parties, is essential to supply the necessary answer. This would, of course, require a jurisdictional act of Congress authorizing the United States to be made a party of such suit. Governor Pittman, of Nevada, has expressed a similar opinion in a letter to me dated March 6, a copy of which is enclosed. I am sure that such a procedure will eventually redound to the benefit of both of our states.

With best wishes for the continued improvement of your health, I am,

Sincerely,

EARL WARREN, *Governor.*

EXECUTIVE OFFICE, STATE HOUSE,
Phoenix, Ariz., May 23, 1947.

Honorable EARL WARREN,
Governor of California, State Capitol, Sacramento, California.

MY DEAR GOVERNOR WARREN: I have received your letter of May sixteenth and appreciate your personal good wishes.

In my letter to you of March twelfth and in my letter to William E. Warne, Acting Commissioner of the Bureau of Reclamation, of November 22, 1946, a copy of which I sent to you, I clearly stated the facts and the reasoning which, in my opinion, lead to the inescapable conclusion that the quantities of apportioned water available for use in Arizona, California, and Nevada, respectively, from the Colorado River are already determined.

If you do not agree with such facts and reasoning and my conclusions, it is regrettable that you do not specify wherein you disagree.

On Page 8 of "The Views and Recommendations of the State of California on Proposed Report of the Secretary of the Interior entitled 'The Colorado River'" there purports to be a list of relevant statutes, decisions, and instruments affecting the Colorado River, but no mention is made of the California self-limitation act, Chapter 16, California Statutes, 1929.

I discussed the California self-limitation act, as well as the other relevant compact, statutes, contracts, and reports in my letters, but in your letters to me you take no exception to any statements in my letters, nor do you set forth any statement of any facts, reasoning, or conclusions as to what claim to water of the Colorado River you intend to assert for California nor the basis for such claim.

California has unconditionally and irrevocably limited herself forever to the quantity of water set out in the California self-limitation act. Arizona has by contract recognized the right of California to the quantity of water set out in that act, and Arizona does not intend to and will not attempt to utilize water to which California is entitled.

Arizona respects her commitments.

Any aspiration entertained in California to use water in excess of that limitation appears to be illegitimate. If California would be content with the use of the quantity of the water to which she has by solemn statutory agreement unconditionally and irrevocably limited herself forever, all occasion for any feeling that any further compact, any arbitration, or litigation is advisable would disappear.

I am sure if you will review my letters and the compact, statutes, contracts, and reports therein mentioned, you will recognize that the only thing required for cooperation between our great states in developing the use of the waters of the Colorado River to which they are respectively entitled for their mutual benefit

and for the benefit of the southwest and the nation is for your great state to respect the agreements your state has already made.

I request that you again review my letters, and if, in your opinion, there is any error in the facts, reasoning, or conclusions stated in my letters, I will appreciate your advising me concerning the same.

With all good wishes, I am,

Sincerely,

SIDNEY P. OSBORN, *Governor.*

EXECUTIVE OFFICE, STATE HOUSE,
Phoenix, Ariz., October 10, 1947.

Honorable EARL WARREN,
Governor, State of California, Sacramento, California.

MY DEAR GOVERNOR WARREN: In my letter to you of March twelfth, 1947, in reply to your letter to me of March third, 1947, I extended to you an invitation in the following words. I quote the last two paragraphs of my letter to you of March twelfth, 1947:

"However, I will be glad to meet and discuss with you and the Governors of the other Colorado River Basin States, jointly or severally, any matters of common interest, and if at such conference or conferences it should develop that there are any substantial differences, we can consider and perhaps resolve such differences; and if it should develop that anything further is necessary, we can consider the proper course to pursue.

"During your incumbency we in Arizona have not had the pleasure of a visit from you. We would like to see you over in our state, and I will greatly appreciate it if you can arrange to come to Phoenix as soon as possible, either alone or with Governor Pittman, or with such other Governors of the basin states as you may desire to have present, in order that any matters which you may desire to further discuss can be gone into fully and thoroughly."

To date you have neither accepted nor declined that invitation.

I note that in the public press there are appearing statements to the effect that I refused to meet with you.

Of course, you and I know that such is not the case, but in order to clear up any possible misunderstanding I herewith repeat the above quoted invitation. I will be glad to meet with you and with the Governors of other Colorado River Basin states, jointly or severally, at any time to discuss matters of common interest.

I suggest you arrange to come to Phoenix before Christmas, giving me twenty days advance notice of the date of your arrival, and the names of the other Governors and advisors who will attend, so that I may make the necessary hotel reservations and arrangements.

With all good wishes, I am

Sincerely,

SIDNEY P. OSBORN, *Governor.*

STATE OF CALIFORNIA,
GOVERNOR'S OFFICE,
Sacramento, October 16, 1947.

The Honorable SIDNEY P. OSBORN,
Governor of Arizona, State House, Phoenix, Ariz.

MY DEAR GOVERNOR: I have your letter of October 10 concerning items in the public press relative to our Colorado River problems. I have not seen the items that you mention but if there is any statement in them to the effect that you have refused to meet and discuss matters with me, they are wholly without foundation. No one has been more willing to discuss our mutual problems than yourself, and I am sure you know that I would never make any expression to the contrary.

The subject of the correspondence to which the press item must have had reference could not have applied to conferences, because innumerable conferences have been held during recent years without reconciling differences of opinion. In addressing you and Governor Pittman on the subject I merely proposed the only three methods that occurred to my mind as being able to lead to a final solution.

1. A compact between the three States, making a determination of all the issues.
2. Arbitration.
3. Judicial determination.

I merely suggested that California was willing to use any of these three methods that is agreeable to Arizona and Nevada. If I could have thought of any other practical method I would have incorporated it also.

Thanking you for calling the matter to my attention and with best wishes, I am

Sincerely,

EARL WARREN, *Governor.*

Mr. HOWELL. Also, I desire at this time to present a supplemental brief which relates only to one question. It was brought about by reason of the fact that the hearing before the Senate committee developed the question by Senator Millikin that a brief be prepared, as I understood it, by both sides, on the question as to whether or not the adoption of this resolution would constitute an encroachment upon the executive branch of the Government and we have prepared such a brief and I have now sufficient copies to file with the committee.

I also have copies here for those who are representing the proponents of the resolution and I ask that that supplemental brief be made a part of the record.

Mr. CASE. That may be done.

(The supplemental brief referred to is as follows:)

SUPPLEMENTAL BRIEF AND ARGUMENT OF THE COLORADO RIVER BASIN STATES COMMITTEE REPRESENTING THE STATES OF WYOMING, COLORADO, NEW MEXICO, ARIZONA, AND UTAH

S. J. RES. 145 PROPOSES AN UNCONSTITUTIONAL ENCROACHMENT BY THE CONGRESS ON THE EXECUTIVE BRANCH OF THE FEDERAL GOVERNMENT

A consideration of S. J. Res. 145 directs the Attorney General of the United States to commence a suit in the Supreme Court of the United States in the nature of interpleader against five named parties, to wit: Arizona, California, Nevada, New Mexico, and Utah.

It is suggested in the joint brief filed on behalf of the Colorado River Basin States Committee that in directing a suit of a specific nature against specific named parties Congress would be encroaching upon the powers of the executive department of the President and more particularly on the executive powers of the Attorney General of the United States, who is the executive officer charged with the responsibility of determining the necessity of legal action, the type of proceeding to be filed, and the parties to be made defendants whenever it shall appear to him that the interests of the United States are involved.

S. J. Res. 145 raises the specific question as to whether the determination of such matters as set forth therein are within the discretion of the legislative department or executive department of our Government.

The answer to this question must of necessity be determined by a consideration of specific constitutional provisions and powers and by a consideration of those legal authorities which interpret those provisions. It is important, therefore, to consider the duties of the Attorney General of the United States.

In 5 Am. Jur., page 236, Section 7, is a discussion of the general nature of the duties of the Attorney General of the United States from which we quote:

"While the Federal statutes which establish and regulate the Department of Justice provide that 'there shall be at the seat of government an executive department to be known as the Department of Justice, and an Attorney General, who shall be the head thereof,' they contain no specific statement of the general duties of the Attorney General; * * *

"While there is no specific statement in the enactments of Congress enumerating the general duties of the office, it is held that as the Constitution contemplates the existence of an officer of the government to determine when the United States shall sue, to decide for what it shall sue, and to be responsible for the conduct of suits, Congress, in creating the office of attorney general and in using that term in other statutes has reference to the similar office under the English law, and therefore have impliedly conferred upon him authority, and made it his duty, to supervise the conduct of all suits brought by or against the United States. * * *"

In 1854 Attorney General Caleb Cushing rendered an opinion to the President of the United States in which he set forth a brief exposition of the history of the office of the Attorney General and from which we quote:

"*Exposition of the early establishment of executive departments.*—The Constitution does not specify the subordinate, ministerial, or administrative functionaries, by whose agency or counsels the details of the public business are transacted. It recognizes the existence of such official agents and advisers, but leaves the number and organization of those departments to be determined by Congress. In the exercise of this duty, the constitutional Congress proceeded at an early day of its first session (July 27, 1789, 1 Stat. 28, c. 4) to establish the 'department of foreign affairs,' with 'a principal officer therein to be called the secretary for the department of foreign affairs.' * * * At the same session (Sept. 24, 1789, 1 Stat. 73) followed 'An Act to establish the judicial courts of the United States,' wherein, by section 35 of said Act, provision was made for the appointment of an attorney general * * *. Such was the original basis of the executive organization of the government. The Secretary of State for political and foreign affairs, the Secretary of War for military and naval matters, the Secretary of the Treasury for those of finance, and the Attorney General for judicial and legal affairs—these were the immediate superior ministerial officers of the President, as well as his constitutional counselors during the whole period of the administration of the first President of the United States" ((1854) 6 Op. Atty. Gen. 326).

The leading case concerning the power of the Attorney General of the United States to initiate a suit in its behalf is the case of *United States* v. *San Jacinto Tin Co.* ((Cal. 1888) 125 U. S. 273, 8 S. Ct. 850, 31 L. Ed. 747). In this case suit was brought by the Attorney General of the United States in behalf of the United States to cancel a patent for land on the ground that it was obtained by fraud or mistake. The Court held that the initial consideration of such a suit lies with the Attorney General as head of one of the executive departments. As this is the leading authority, we desire to quote at length therefrom. Mr. Justice Miller in speaking for the Court said, in 8 S. Ct. 850, at page 853:

"Another question, however, is raised by counsel for the defendant, which is earnestly insisted upon by them, and which received the serious consideration of the judges in the circuit court; namely, the right of the attorney general of the United States to institute this suit. * * * *It is denied that the attorney general has any general authority under the constitution and laws of the United States to commence a suit in the name of the United States to set aside a patent,* or other solemn instrument issued by proper authority. It is quite true that the Revised Statutes, in the title which establishes and regulates the department of justice, simply declares, in section 236, that 'there shall be at the seat of government an executive department, to be known as the Department of Justice, and an attorney general, who shall be the head thereof.' There is no very specific statement of the general duties of the attorney general, but it is seen from the whole chapter referred to that he has the authority, and it is made his duty, to supervise the conduct of all suits brought by or against the United States, and to give advice to the president and the heads of the other departments of the government. There is no express authority vested in him to authorize suits to be brought against the debtors of the government, or upon bonds, or to begin criminal prosecutions, or to institute proceedings in any of the numerous cases in which the United States is plaintiff; and yet he is invested with the general superintendence of all such suits, and all the district attorneys who do bring them in the various courts in the country are placed under his immediate direction and control. * * * If the United States, in any particular case, has a just cause for calling upon the judiciary of the country, in any of its courts, for relief by setting aside or annulling any of its contracts, its obligations, or its most solemn instruments, the question of the appeal to the judicial tribunals of the country must primarily be decided by the attorney general of the United States. * * * *There must, then, be an officer or officers of the government to determine when the United States shall sue, to decide for what it shall sue, and to be responsible that such suits shall be brought in appropriate cases.* * * * The judiciary act of 1789, in its third section, which first created the office of attorney general, without any very accurate definition of his powers, in using the words that 'there shall be appointed a meet person, learned in the law, to act as attorney general for the United States' (1 U. S. St. at Large, 93) must have had reference to the similar office with the same designation existing under the English law; and, though it has been said that there is no common law of the United States, it is still quite true that when acts of congress use words which are familiar in the law of England, they are

supposed to be used with reference to their meaning in that law. *In all this, however, the attorney general acts as the head of one of the executive departments, representing the authority of the president in the class of subjects within the domain of that department, and under his control.*" [Emphasis supplied.]

The only applicable case decided by the U. S. Supreme Court prior to the *United States* v. *San Jacinto Tin Co., supra,* is the case of *United States* v. *Hughes* (11 How. 552), which also involved cancellation of a patent. In this case it was held that it was proper for the Attorney General to file an information on behalf of the United States to cancel the patent.

In another case, *United States* v. *Beebe* (127 U. S. 228, 8 Ct. 1083), decided at the same term of court, the Attorney General's action in bringing a suit in behalf of the United States to cancel a patent was approved.

Since the decision in *United States* v. *San Jacinto Tin Co., supra,* there have been innumerable cases in both the Supreme Court of the United States and in the lower federal courts in which it has been held that the Attorney General in initiating a suit in behalf of the United States is exercising an executive function. Among those cases are the following:

Sanitary District of Chicago v. *United States* (45 S. Ct. 176, 266 U. S. 405, 69 L. Ed. 352);

New York v. *New Jersey* (41 S. Ct. 492, 256, U. S. 296, 65 L. Ed. 937);

United States v. *American Bond & Mortgage Co.* (31 F. (2d) 448, Aff. 52. F. (2d) 318; certiorari denied 52 S. Ct. 311, 285 U. S. 538, 76 L. Ed. 931);

North Dakota-Montana Wheat Growers Ass'n v. *United States* (66 F. (2d) 573, 92 A. L. R. 1484, writ of certiorari denied in 291 U. S. 672, 78 L. Ed. 1061, 54 S. Ct. 457);

United States v. *American Bell Telephone Co.* (128 U. S. 315, 367, 9 S. Ct. 90, 32 L. Ed. 450);

Application of Texas Company (27 F. Supp. 847);

United States v. *Koleno,* 226 F. 180, 141 C. C. A. 178;

In re Debs., 158 U. S. 564, 15 S. Ct. 900, 906, 39 L. Ed. 1092.

In the case of *Sanitary District of Chicago* v. *U. S., supra,* Mr. Justice Holmes said at 45 S. Ct. 177:

"This is not a controversy between equals. The United States is asserting its sovereign power to regulate commerce and to control the navigable waters within its jurisdiction. It has a standing in this suit not only to remove obstruction to interstate and foreign commerce, the main ground, which we will deal with last, but also to carry out treaty obligations to a foreign power bordering upon some of the Lakes concerned, and, it may be, also on the footing of an ultimate sovereign interest in the Lakes. *The Attorney General by virtue of his office may bring this proceeding and no statute is necessary to authorize the suit. United States* v. *San Jacinto Tin Co.* (125 U. S. 273, 8 S. Ct. 850, 31 L. Ed. 747)." [Emphasis supplied.]

It was held in *United States* v. *American Bond & Mortgage Co., supra,* that the Attorney General by virtue of his office might bring suit in behalf of the United States to enjoin radio broadcasting without a license under Radio Act, 1927 (44 Stat. 1162), as amended March 29, 1928 (45 Stat. 373).

It was held in *North Dakota-Montana Wheat Growers Ass'n* v. *United States, supra,* that the Attorney General of the United States was authorized to institute a suit by the United States to foreclose a mortgage given by the cooperative association to the Farm Board under the Agricultural Marketing Act (7 U. S. C. A. Sections 521–535; 5 U. S. C. A. Sections 291–339), the Court said at page 577:

"The moneys advanced by the Farm Board under the Act of Congress providing a revolving fund of $500,000,000 were government funds to be devoted to the advancement of a public purpose. By this suit the right to have the money of the government loaned for a public purpose returned to it is being asserted. The argument is not at all appealing that the government had no authority to bring this action merely because the Agricultural Marketing Act did not so provide, and that it must be brought by the Farm Board. We have pointed out that the Farm Board had no such authority. The government being the proper party to bring the suit, *it follows that the Attorney General, the head of the Department of Justice with broad powers and responsibilities in respect to all legal matters of the government* (sections 291–339, chapter 5, title 5, USCA) had *authority to initiate this action. United States* v. *San Jacinto Tin Co.* (125 U. S. 273, 8 S. Ct. 850, 31 L. Ed. 747)." [Emphasis supplied.]

It is crystal clear from consideration of these authorities that the power to initiate suits, determine the type of action to be followed, and to select the parties to be sued is within the executive power of the United States and more

particularly is vested in the President of the United States and his subordinate officers by virtue of Article II, Section 3, of the United States Constitution which provides "He (President) shall take care that the laws be faithfully executed."

On the other hand, it is plain that S. J. Res. 145, directing the Attorney General of the United States to file a suit of a particular nature against particular named parties, would constitute an encroachment upon the executive power by Congress and therefore is unconstitutional.

There is no doctrine in American Constitutional Law better known than that of the separation of powers. There is little need for citing voluminous authorities relating to this doctrine. It is well recognized that the Constitution divides the powers among the three great departments—the legislative, the executive, and the judiciary—and that, insofar as the powers are expressly divided, the departments are independent of each other and not subject to encroachment from either of the others or both. As it is plain from consideration of the authorities heretofore cited that the Attorney General in instituting a suit in behalf of the United States is exercising an executive power specifically provided for in Article II, Section 3, of the Federal Constitution, to wit: to execute the laws, it is obvious that S. J. Res. 145 is an encroachment.

Nowhere in the Constitution is there any authority granted to Congress to execute the laws. Its duty is to enact the laws. *Springer* v. *The Government of the Philippine Islands* (48 S. Ct. 480, 277 U. S. 189, 72 L. Ed. 845).

A review of the elementary principles of our form of government is contained in the opinion of the United States District Judge of the District of Illinois in the case of *Application of Texas Company* (27 F. Supp. 847 at 849). In substance the Court reviews these well-known principles concerning the division of powers and states that the function of Congress is to make laws, the function of the Supreme Court is to interpret laws, and the function of the executive department is to execute laws. It is only because there has been a blending of powers in certain instances that there has been any confusion.

An example of the blending of powers is found in the power of the President to approve or disapprove legislation. This, however, is a limited participation in the legislative function by the President authorized by the Constitution. The performance of such an act by the President is legislative rather than executive in character.

Senate Document 232, 74th Congress, 2d Session, entitled "The Constitution of the United States of America, Annotated," (1938) page 101, contains this language:

Encroachment by the Executive: "The doctrine of separation of power is, of course, applicable to the Executive and to Congress, except insofar as the Constitution authorizes the President to veto legislation, to inform Congress on the state of the Union, to conduct foreign affairs, etc.

"The exercise of the Presidential 'pocket veto' after Congress adjourns is not an encroachment on legislative prerogatives. He has 10 days in which to indicate his approval or disapproval; if Congress adjourns in the interim, it thereby prevents a return of the bill."[1]

The power of the President to approve or disapprove legislation passed by Congress is contained in article I of the Constitution covering the "legislative department." (Article I, section 7, clause 2, of the Constitution.)

The question of separation of powers and encroachment by one department on another was the subject of a series of articles appearing in the Federalist and written by either Madison or Hamilton. These articles in the Federalist are XLVII, XLVIII, XLIX, L, and LI. Madison points out in the first of these articles a fact which is familiar to most of us, that Montesquieu was the originator of "the doctrine of separation of powers." In referring to Montesquieu, Madison says:

"His meaning, as his own words import, and still more conclusively as illustrated by the example in his eye, can amount to no more than this, that where the whole power of one department is exercised by the same hands which possess the whole power of another department, the fundamental principles of a free constitution are subverted."

In discussing the question of legislative encroachment Madison says:

"The legislative department derives a superiority in our government from other circumstances. Its constitutional power being at once more extensive, and less susceptible of precise limits, it can, with the greater facility, mask,

[1] *Okagogan Indians* v. *United States* (pocket veto case), 279 U. S. 655 (1929).

under complicated and indirect measures, the encroachments which it makes on the coordinate departments. It is not infrequently a question of real nicety in legislative bodies, whether the operation of a particular measure will, or will not, extend beyond the legislative sphere. On the other side, the executive power being restrained within a narrower compass, and being more simple in its nature, and the judiciary being described by landmarks still less uncertain projects of usurpation by either of these departments would immediately betray and defeat themselves. Nor is this all; as the legislative department alone has access to the pockets of the people, and in some constitutions full discretion, and in all a prevailing influence, over the pecuniary rewards of those who fill the other departments, a dependence is thus created in the latter, which gives still greater facility to encroachments of the former.

Madison then quotes Jefferson's Notes on the State of Virginia, page 195:

"All the powers of government, legislative, executive, and judiciary, result to the legislative body. The concentrating there in the same hands, is precisely the definition of despotic government. It will be no alleviation, that these powers will be exercised by a plurality of hands, and not by a single one. One hundred and seventy-three despots would surely be as oppressive as one. Let those who doubt it, turn their eyes on the republic of Venice. As little will it avail us, that they are chosen by ourselves. An elective despotism was not the government we fought for; but one which should not only be founded on free principles, but in which the powers of government should be so divided and balanced among several bodies of magistracy, as that no one could transcend their legal limits, without being effectually checked and restrained by the others. For this reason, that convention which passed the ordinance of government, laid its foundation in this basis, that the legislative, executive, and judicial departments should be separate and distinct, so that no person should exercise the powers of more than one of them at a time. *But no barrier was provided between these several powers,* [Italics supplied.]

"The judiciary and the executive members were left dependent in the legislative for their subsistence in office, and some of them for their continuance in it. *If, therefore, the legislature assumes executive and judiciary powers, no opposition is likely to be made; nor, if made, can be effectual; because in that case they may put their proceedings into the form of acts of Assembly, which will render them obligatory on the other branches.* They have accordingly in many instances, decided rights which should have been left to judiciary controversy, and the direction of the executive, during the whole time of their session, is being habitual and familiar." [Italics supplied.]

This series of articles on the question of separation of powers is concluded with Federalist LI, in which Madison states that as all the exterior provisions are inadequate to prevent encroachment, the defect must be supplied from within the interior structure of the Government itself, and that the several departments of the Government may by their mutual relations be the means of keeping each other in their proper places.

The case of *Marbury* v. *Madison* is particularly in point in considering S. J. Res. 145. It is unnecessary to detail the familiar facts in this great case. However, it is most helpful to consider language from the opinion. At page 175 thereof we find the following:

"This original and supreme will organizes the government, and assigns to different departments their respective powers. It may either stop here, or establish certain limits not to be transcended by those departments.

"The government of the United States is of the latter description. The powers of the legislature are defined and limited; and that those limits may not be mistaken, or forgotten, the constitution is written. To what purpose are powers limited, and to what purpose is that limitation committed to writing, if these limits may, at any time, be passed by those intended to be restrained? The distinction between a government with limited and unlimited powers is abolished, if those limits do not confine the persons on whom they are imposed, and if acts prohibited and acts allowed, are of equal obligation. *It is a proposition too plain to be contested, that the constitution controls any legislative act repugnant to it;* or that the legislature may alter the constitution by an ordinary act.

"Between these alternatives there is no middle ground. The constitution is either a superior paramount law, unchangeable by ordinary means, or it is on a level with ordinary legislative acts, and, like other acts, is alterable when the legislature shall please to alter it.

"If the former part of the alternative be true, then a legislative act contrary to the constitution is not law; if the latter part be true, then written constitutions

are absurd attempts, on the part of the people, to limit a power in its own nature illimitable.

"Certainly all those who have framed written constitutions contemplate them as forming the fundamental and paramount law of the nation, and, consequently, the theory of every such government must be that an act of the legislature, repugnant to the constitution, is void.

"This theory is essentially attached to a written constitution, and is, consequently, to be considered, by this court, as one of the fundamental principles of our society. It is not therefore to be lost sight of in the further consideration of this subject.

"If an act of the legislature, repugnant to the constitution, is void, does it, notwithstanding its invalidity, bind the courts, and oblige them to give it effect? Or, in other words, though it be not law, does it constitute a rule as operative as if it was a law? This would be to overthrow in fact what was established in theory; and would seem, at first view, an absurdity too gross to be insisted on. It shall, however, receive a more attentive consideration." [Emphasis supplied.]

And at page 165 thereof we find the following:

"By the constitution of the United States, the President is invested with certain important political powers, in the exercise of which he is to use his own discretion, and is accountable only to his country in his political character and to his own conscience. To aid him in the performance of these duties, he is authorized to appoint certain officers, who act by his authority, and in conformity with his orders.

"In such cases, their acts are his acts; and whatever opinion may be entertained of the manner in which executive discretion may be used, *still there exists, and can exist, no power to control that discretion.* The subjects are political. They respect the nation, not individual rights, and being intrusted to the executive, the decision of the executive is conclusive. The application of this remark will be perceived by adverting to the act of congress for establishing the department of foreign affairs. This officer, as his duties were prescribed by that act, is to conform precisely to the will of the President. He is the mere organ by whom that will is communicated. The acts of such an officer, as an officer, can never be examinable by the courts.

"But when the legislature proceeds to impose on that officer other duties; when he is directed peremptorily to perform certain acts; when the rights of individuals are dependent on the performance of those acts, he is so far the officer of the law, is amenable to the laws for his conduct, and cannot at his discretion sport away the vested rights of others.

"*The conclusion from this reasoning is, that where the heads of departments are the political or confidential agents of the executive, merely to execute the will of the President, or rather to act in cases in which the executive possesses a constitutional or legal discretion, nothing can be more perfectly clear than that their acts are only politically examinable.* But where a specific duty is assigned by law, and individual rights depend upon the performance of that duty, it seems equally clear that the individual who considers himself injured, has a right to resort to the laws of his country for a remedy." [Emphasis supplied.]

It is obvious from a consideration of *Marbury* v. *Madison*, supra, above quoted, that there are two types of power which are normally exercised by the head of an executive department. The one is ministerial, and undoubtedly Congress has authority under the Constitution to require an executive officer to perform a ministerial duty. The other is within the constitutional executive discretion. It is at once apparent from the authorities cited in this memorandum that the Attorney General in initiating suits in the name of the United States is acting within his constitutional executive discretion and is not subject to the control of Congress. He is acting in a case in which the executive possesses a constitutional or legal discretion by virtue of the constitution itself—in this case under the authority of Article II.

It is further submitted that if Congress has the power, as suggested by S. J. Res. 145, to say what suits shall be filed and against whom, and for what purpose, then by the same token it would have the right to say what suits are not to be filed, and such an exercise of power would clearly be an usurpation on the part of Congress of the whole power vested in the President by Article II, Section 3, to see that the laws are faithfully executed.

Heretofore the proponents of this resolution presented to this Committee a number of congressional statutes for the purpose of showing that Congress has the authority to enact legislation such as S. J. Res. 145. An analysis of these

statutes shows: first, in every statute but one a discretion as to whether or not an action should be filed, was left to the Attorney General of the United States, where it clearly belongs under the Constitution; second, in each of these statutes there is a definite well-defined interest of the United States in the public lands to be protected and it was therefore perhaps proper under U. S. Constitution, Art. IV, Sec. 3, cl. 2, for the Congress to enact the particular law; third, the question of legislative encroachment upon executive power was apparently never raised in connection with any of these statutes, and had it been, it is submitted an attempt to deny the executive department its constitutional discretion would be a violation of the constitution.

CONCLUSIONS

The conclusions reached by the Colorado River Basin States Committee, and of the States of Colorado, Wyoming, Utah, New Mexico, and Arizona, which are members of that Committee, may be summarized as follows:

1. The powers of the general government are divided by the Constitution among the legislative, the executive, and the judicial departments and insofar as the powers are expressly divided, the several departments are independent of each other and not subject to encroachment.

2. The Attorney General of the United States in commencing a suit or action on behalf of the United States is carrying out an executive power and duty vested in the President of the United States by Article II of the United States Constitution.

3. The President of the United States in the exercise of this executive power has a complete discretion; to aid him he has the Attorney General of the United States, the head of the Department of Justice, who acts by his authority and executes his will in exercising this constitutional and legal discretion; and no other branch of the Government can control this discretion or usurp this power.

4. The approval or disapproval by the President of legislation passed by Congress is the performance, under a specific provision of the Constitution, of a function legislative rather than executive in character.

5. The Congress of the United States by the passage of Senate Joint Resolution 145, would be encroaching upon the executive power of the President in directing the Attorney General of the United States to commence an action of a specific nature against specific named parties as this determination is within the constitutional discretion of the President and the Attorney General, pursuant to Article II of the United States Constitution.

Respectfully submitted.

The Colorado River Basin States Committee:
State of Colorado: Clifford H. Stone, chairman; Frank Delaney.
State of Wyoming: L. C. Bishop, H. Melvin Rollins.
State of New Mexico: Fred E. Wilson, John H. Bliss.
State of Arizona: Nellie T. Bush, Charles A. Carson.
State of Utah: W. R. Wallace, Grover A. Giles.

Subcommittee to Oppose Litigation:
State of Utah: J. A. Howell, chairman; Grover A. Giles.
State of New Mexico: Fred E. Wilson, Martin A. Threet.
State of Colorado: Clifford H. Stone, Jean S. Breitenstein.
State of Arizona: Nellie T. Bush, Charles A. Carson.
State of Wyoming: Norman B. Gray, Attorney General; H. Melvin Rollins.

Mr. MURDOCK. Also we have present today Mr. Thornton Jones, of Arizona, who has waited several days to present his statement. I regret, Mr. Jones, that we cannot take the time today to hear your statement read, but if you will submit it for the record, we should appreciate it.

(The statement referred to is as follows:)

STATEMENT OF A. T. (THORNTON) JONES, BUCKEYE, ARIZ.

My name is A. T. (Thornton) Jones and I live at Buckeye, Ariz. I have resided in the State since 1918 and since January 1935 have been associated with the Buckeye Irrigation Co. During this employment I have served as secretary-treasurer and later as manager of the company. I also own and operate a 120-acre irrigated farm.

For about 10 years of my employment with the irrigation district, at least one-

half of my time was taken up with negotiations to settle differences between the Buckeye project and upstream users over a diminishing water supply and a constantly increasing salt content of the reduced supply.

Because of the location of Buckeye in reference to the irrigated empire of central Arizona, and the large number of defendants involved, including Federal projects, Judge Clifford H. Stone, of Denver, Colo., was appointed by the Secretary of Interior to serve as mediator in the negotiations and Mr. R. J. Tipton, also of Denver, served as engineering adviser to Judge Stone.

This mediation settled an important phase of a controversy which had been in the courts for almost 20 years.

In these present hearings I wish to tell you something of the needs of the presently irrigated lands lying west of the Agua Fria River and along the Gila River proper, west of the junction of the Agua Fria with the Gila.

The problems of this area are twofold, one being an inadequate water supply; the other, an excess quantity of salt.

A tabulation of irrigated acreages and districts in the area is attached, showing a total acreage of about 153,000. This acreage can be classified in two divisions because of different needs. The first division, amounting to about 63,150 acres is primarily in need of additional water. The latter, amounting to about 89,850 acres being in need of additional water and also in need of relief from the high salt content of the water now being used.

FIRST DIVISION

The Agua Fria River rises in the mountains of Arizona slightly north and west of the geographic center of the State. Its flow is almost directly south to where it joins the Gila River about 15 miles west of Phoenix and about 3 miles west of the junction of the Salt with the Gila.

The Carl Pleasant Dam of 178,000 acre-feet capacity impounds the floodwaters of the Agua Fria River for the benefit of some 31,500 acres of land which is organized as the Maricopa County municipal water conservation district No. 1.

The gravity flow of the river, however, is not sufficient for an adequate water supply and amounts to only about 50 percent of the district's needs. There are long periods of time when, on an annual basis, the supply drops to 10 to 15 percent of the requirements. The district has irrigation wells to supplement this supply. This well supply is adequate for only about 50 percent, leaving a shortage in low river years. The pumping level is deep, ranging from 260 to 380 feet and averaging about 300 feet over the district. The constant pumping of the past 8 years has lowered the water table about 60 feet. The quality of water, however, has held up in this lowering.

The private pump lands are lower and nearer the Agua Fria River. The pumping depth ranges from 250 to 300 feet. This area has had a lowering of water table likewise of about 60 feet during the same time. Some change, however, in the quality of this pumped water in the area on the west side of the Agua Fria is beginning to show an increasing salt content. This is due to the lowering of this table pulling in water from the east of a higher salt content, which is from under the Salt River project lands.

The Goodyear and the Adaman municipal areas are lower in elevation and the average pumping table ranges from 160 to 250 feet. The drop in table ranged about 50 feet in the like period. It also is showing some increase in salt content due to the same reason as above.

The private pump lands, the Goodyear Farms and the Adaman Municipal Water Co. lands are dependent on pumps alone.

Most of the area listed above in division I, west of the Agua Fria River, is proven land for citrus, vegetables and melons, as well as cotton and other general farm crops. It needs additional water, however, to prevent the water table dropping below economic limits, and to prevent the encroachment of the higher salt water from the easterly areas.

SECOND DIVISION

The second division of about 89,850 acres is in need of additional water but its principal need is sweet water to correct salt concentrations.

The Roosevelt irrigation district of 38,000 acres is dependent entirely upon pumps. It pumps about 75 percent of its water from the lower side of the Salt River Valley lands along the Gila River from Phoenix to the Agua Fria River, and the balance from pumps on its own land. This water being from the low side of the major irrigated area of the valley, and principally seepage from

the irrigated lands above it, is high in salt content—ranging from 1,200 to 2,800 parts per million. The water table along the lower Salt River Valley has not lowered appreciably. As it is in the seepage drainage from the higher lands, the salt content has and is increasing. The wells on the west of the Agua Fria River on the district lands have lowered, and also increased in salt content.

The land of the Gillespie Land & Irrigation Co. is served by a diversion dam about 30 miles west of the lower end of the Salt River Valley on the Gila River, and now to a large extent from wells. The wells lying some distance from the river are of fair quality water, seemingly drawing much of this water from the area to the east. The water diverted from the river is principally effluent seepage water from the valley in intermittent quantities, not dependable for stable operation. This water is generally very high in salt content, at times in excess of 4,000 parts per million.

The Enterprise Ranch, consisting of approximately 1,000 acres, just across the river from the Gillespie project, has one well and pump but gets most of its water from the Gila River and Gillespie Dam.

Now I wish to talk about the Buckeye and Arlington districts, the projects with which I am most familiar.

The Buckeye district comprises about 20,000 acres of land beginning about 20 miles west of Phoenix and extending another 20 miles along the north bank of the Gila River.

The Arlington district comprises about 4,000 acres extending beyond and downstream from the Buckeye district.

In the early years of the projects, lands in the Arlington district were served with gravity water by extending the Buckeye canal. It was noted, however, that in low-flow periods when all available water of the river was being diverted in the Buckeye canal, there was additional water flowing in the river opposite the Arlington lands, this water having risen below the Buckeye diversion. Because of this condition Arlington proceeded to install its own diversion works, and service through the Buckeye canal was discontinued.

The irrigation works serving the Buckeye district with water is owned and operated by a mutual association of farmers, organized as a corporation. Each share of stock is inseparably attached to 1 acre of land and a transfer of title to the land carries with it a transfer of the stock; the stock cannot be transferred apart from the land. The average size of each farm is 80 acres, principally operated by home owners.

The headworks of the district are located at about the 900-foot elevation, at the outflow of an alluvial plain which begins where the Gila River and its various tributaries emerge from the mountains.

Except for the Santa Cruz River, these streams leave the mountains in the neighborhood of the 1,600-foot elevation and enter the alluvial plain or valley fill, one tributary, the Agua Fria, entering about 30 miles north from the Buckeye heading, another, the Salt River, 40 miles to the east, and the Gila River proper 70 miles to the southeast.

Through this slightly elongated plain of about 3,000 square miles the main stem of the Gila River and its several tributaries have meandered back and forth through the ages, depositing layers of coarse and permeable detrital from which enormous quantities of water have been and are being pumped for irrigation purposes.

The Buckeye district has no storage facilities and since 1887, has diverted surface flow of the Gila River by means of a low diversion dam located about 18 miles west of Phoenix and 3 miles below the junction of the Salt and Gila Rivers.

According to reports of the early settlers, when the whites first came to this desert area, the Gila River had a narrow flood channel, in many places not more than 100 feet wide, with an extensive flood plain covered with heavy vegetation which nature consistently irrigated with every freshet. It was the return flow from this flood plain and from these freshets that furnished the Buckeye project with a constant water supply during the early years of its existence.

With the increase of irrigation above Buckeye, seepage and return flow from irrigation for a time continued to furnish the Buckeye canal with a passable water supply until heavy pumping from the boulder beds underlying the flood plain intercepted the return flow and diminished the supply.

The Roosevelt Dam on the Salt River was the first storage dam built on the river system and the increased application of water resulting from that storage

increased the low-flow water in the river at the Buckeye head until pumping for the irrigation of new lands intercepted this return flow.

A tabulated list is attached showing the names of the various canals diverting water from the streams in central Arizona prior to 1909, as disclosed by three separate court decrees establishing dates of priority and before there was any storage development on any of the State streams. Also, the acreage of each canal, except that the Indian canals on the Gila Indian Reservation are not included.

Prior to the effective dates of these decrees it was common practice among the various canals to divert all the water reaching their respective heads during low flow, and each canal could divert only the amount of water which rose in the river between its own headworks and the works of the next canal above. In times of flood, however, considerable excess water was diverted which found its way back to the stream as return flow.

It was in this manner that man-made irrigation in the Gila flood plain similated nature's irrigation in the same flood plain before the white man's advent, and man-made return flow into the river similated nature's return flow which natural floods had created in the river in its natural stage. Also, man-made crops came to use some of the same water that natural vegetation had previously used under natural conditions.

There were six of these small canals immediately above the Buckeye head within a distance of 20 miles but at the present time the river is entirely dry at five of the headings, and except for floods has been dry for several years. All of these six headings have been abandoned and the lands are now being supplied with pumped water.

Except in times of flood, Buckeye has always, during summer months, diverted all the water reaching its head. Down stream below Buckeye the Arlington canal does the same, and still further down stream the Gillespie canal has, since 1923, diverted all the summer flow at its heading except in flood time.

Between the years 1909 and 1939 a total of seven storage dams have been built on the Agua Fria, Gila, and Salt Rivers above the Buckeye heading, and the flood flow of all these streams which had previously furnished water to Buckeye was impounded.

The impounding of flood waters plus extensive pumping progressively reduced the supply of water available to Buckeye and in 1930 it became necessary for Buckeye to install pumps to keep her lands in cultivation.

The reduction in stream flow, however, was not the only damage which Buckeye suffered. Salt in varying quantities is present in most of the central Arizona area. Because of the hot and arid conditions, salt residue is left along the stream banks by heavy evaporation and plant growth.

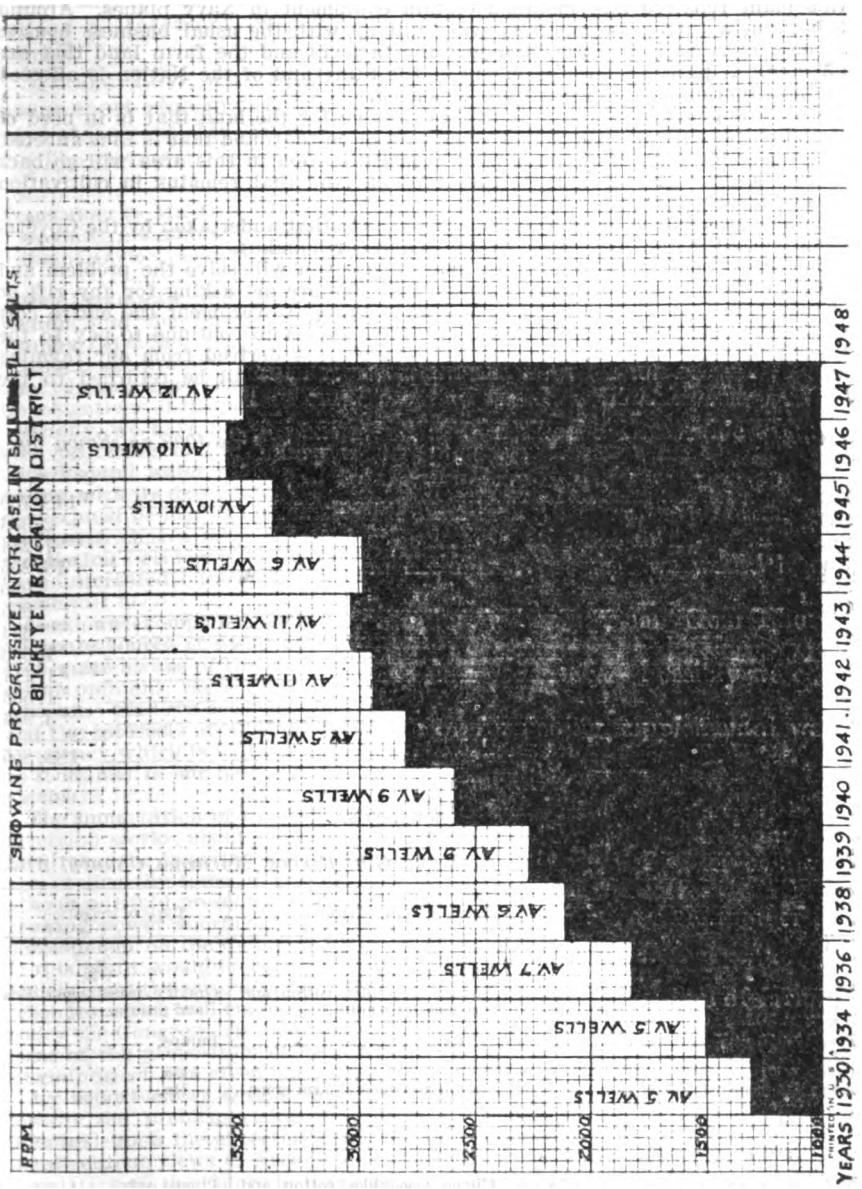
Before the impounding of floodwaters this salt residue was diluted and carried away by each successive flood and the accumulations of salt were held to a reasonable balance. With the building of each storage dam, however, the flood flow was reduced and the salt content of the water available for Buckeye began to rise. While the flood flow itself was always low in salt content the average low flow in the river rose from about 2,000 parts per million in the year 1900 to about 3,000 parts per million in the year 1930 at which time the Buckeye wells were installed. Since 1930 the salt content has been still further increased till the low flow is now almost 4,000 parts of salt per million.

The Buckeye wells have shown an even more marked increase in salt content. An accompanying chart shows the progressive increase in salt content of these wells from an average of a little over 1,300 parts per million in 1930 to about 3,500 parts in 1947.

This increase in salt in the wells is due to the use and reuse of the water reaching Buckeye wells from the underground flow. Part of the water diverted and used by the Salt River project is pumped and reused by that project. It is then captured by the pumps of other users and used a third time and Buckeye pumps make the same water available a fourth time for irrigation use. Some of this same water is used a fifth time when it is captured by Arlington, Gillespie, and other users below Buckeye.

The use of such saline water limits the grower to the raising of such crops as are tolerant of salt, and even the tolerant crops are dwarfed in yield.

The Bureau of Reclamation in its report on the central Arizona project discusses this salt problem with the conclusion that it will be necessary to discharge approximately 376,000 acre-feet of water from the project area each year in order to maintain the salt balance.



In this over-all area that I have talked to you about as being west of the Agua Fria River, people have built their homes and carried on their farming operations. In the majority of cases their whole economic existence is at stake. The matter goes further than that, however. Not only are farm homes and farm investments at stake but in this area are located five towns and other rural communities. Business houses, banks, stores, service stations, etc., are now in existence in these towns and communities. Schools have been built, both grade and high. Bond have been issued to pay for these schools and other public buildings and investments.

A plant known as the Goodyear Air Craft Corp. was built on the Goodyear holdings during the last war at a cost of several million dollars. During the war

this plant repaired and installed certain equipment in Navy planes. Around this plant a thriving community was built up with the usual business houses, schools, etc. So it is more than just the farmers and the farm land that are affected. A portion of the economy of the State and of the Nation is affected by the situation that now confronts this area.

Unless supplemental water is made available for the land that is in need of it and unless the salt situation is taken care of on that land that is thus affected, a considerable portion of the land now in cultivation in this area will go back to the desert and the value of the crops on land that remains in cultivation will be greatly reduced.

This is just as much a rescue proposition as is that undertaken by the Government when disasters are caused by floods and earthquakes.

The enactment of the legislation now before you will solve the problem and save this farm land and these communities. We are not asking for any gift or charity. We expect to repay to the United States Government the entire cost of the project. While we are repaying it we expect to continue to pay to the United States Government, income and other taxes derived from our farming and business operations. In the ultimate end there will be returned to the Government many times the cost of the project.

Grand total	153,000		

Mr. MURDOCK. We have with us Mr. Sidney Kartus who has submitted a statement, which will be included in the appendix of the record.

We also have with us Mr. E. A. Moritz from Boulder City, who has a short statement. Mr. Moritz must get away. Would you file your statement, Mr. Moritz?

(The statement referred to is as follows:)

STATEMENT OF MR. E. A. MORITZ, REGIONAL DIRECTOR, REGION 3, BUREAU OF RECLAMATION, HEARINGS BEFORE THE HOUSE SUBCOMMITTEE ON IRRIGATION AND RECLAMATION, EIGHTY-FIRST CONGRESS, ON H. R. 934 AND H. R. 935

MR. CHAIRMAN AND GENTLEMEN: I am E. A. Moritz, Regional Director of Region 3 of the Bureau of Reclamation. Headquarters of Region 3 are in Boulder City, Nev.

I shall not present a detailed description of this project now under consideration. I shall leave that to Mr. Larson, who has been in immediate charge of our investigations of the project.

Briefly, we have been convinced that the irrigation farming economy of the area centering in Phoenix cannot permanently depend upon "mining" of its underground water resources. That economy must shrink to a magnitude consistent with its dependable water supply, or in the alternative, its water requirements must be met. Comments on our report have not altered our fundamental conclusion that a large share of Arizona's economy, and a substantial unit of the Nation's economy, is threatened. As a conservation agency, we necessarily have interested ourselves in seeking means to preserve the existing economy whole.

Local water supplies, wholly developed, would be quite inadequate. The only adequate source of water physically available is the Colorado River. We have been quite aware of the conflicting claims to Colorado River water. Under one set of opinions, there could be no Colorado River water imported into central Arizona. Had we accepted those opinions, no report could have been prepared, and the interests of Arizona would thereby have been improperly prejudiced by an agency which is without authority to adjudicate the controversy. The report as it stands is our best effort to avoid the prejudicing of the interests of any parties.

The importation of Colorado River water requires, in addition to canals and diversion works, about 1,500,000,000 kilowatt-hours of electrical energy annually for lifting the imported water to a height from which it can flow to the Phoenix area under the force of gravity. There is no source from which such a block of energy could presently be secured; rather, there is an immediate serious and growing power shortage in our region. Our plan contemplates a major power development on the Colorado River, at Bridge Canyon. One-third of the output of this plant would be used for project purposes, the balance would be available to help meet the serious power shortages in the area, and to provide those surplus revenues which will enable power to be the "paying partner," consistent with the policy the Congress has endorsed many times. I can assure you that my endorsement of the proposition of dedicating a major hydroelectric potentiality to this single project was given only after most careful consideration.

My report closes with a set of recommendations as to sound Federal policy toward the problem rising in central Arizona. Those recommendations are premised upon the expectation that the Congress will give full consideration to the divergent views of Arizona and California as to their respective interests in the waters of the Colorado River before providing funds for the construction of those project features which depend for the full realization of their objectives upon Arizona's claims being held valid.

In those recommendations, I suggest for your consideration certain criteria as to nonreimbursable allocations of cost to correlative functions of the project, such as preservation and propagation of fish and wildlife, recreation, general salinity control, silt control, and flood control. I suggested also formulae for securing repayment of those project costs assigned to the direct beneficiaries of the project. The bill under consideration does not follow those criteria and formulae precisely. Studies by my staff indicate that the provisions of this bill do not alter significantly the showing of economic justification for the proposed

project, nor do they change in material degree the repayment obligations of the water and power users.

To assure full realization of the objectives of the project plan, and to place a part of the repayment obligation upon those who would benefit secondarily from the project, I placed certain qualifications upon my recommendations. I proposed that before the physical works which would carry Colorado River to central Arizona be constructed:

(*a*) Arizona enact legislation which would assure nonrepetition of the mining of groundwater;

(*b*) There be established an organization in the central Arizona area, in the nature of a conservancy district, with the power to levy taxes, and to contract with the United States for payment of reimbursable project costs allocated to irrigation, municipal water, and miscellaneous purposes; and

(*c*) That such organization provide satisfactory assurance that the exchanges of Colorado River water for Salt River water, and of Salt River water for Gila River water, will be effected.

These qualifications would place upon Arizona necessary responsibilities which only Arizona can assume. The present bill does not require that Arizona assume these responsibilities, and to that extent provides a lesser assurance of project success than seems warranted. I should like to see consideration given to amendments which would place these responsibilities upon Arizona.

Mr. J. G. WILL. Mr. Chairman, may I at the same time file a brief statement by Commissioner Straus who regrets his inability to be here?

Mr. MURDOCK. Without objection, the statement will be received.

(The statement referred to is as follows:)

STATEMENT OF MICHAEL W. STRAUS, COMMISSIONER OF RECLAMATION AT HEARINGS BEFORE THE SUBCOMMITTEE ON IRRIGATION AND RECLAMATION OF THE PUBLIC LANDS COMMITTEE OF THE HOUSE OF REPRESENTATIVES ON H. R. 934

The Bureau of Reclamation has prepared a report entitled, "Report on Central Arizona Project." That report has been transmitted to the various Federal agencies and to affected States in accordance with the Flood Control Act of 1944 (58 Stat. 887), the act of August 14, 1946 (60 Stat. 1080), and departmental regulations. The Secretary of the Interior has adopted and appproved the report and has transmitted it to the Congress together with comments of the affected States and Federal agencies in accordance with those acts and regulations. The bill, H. R. 934, which you are now considering, would authorize the project described in the Report.

It is not my intent to describe in detail the central Arizona project as visualized by the Bureau. I shall leave that for Mr. E. A. Moritz, Regional Director of the Bureau of Reclamation of Boulder City, Nev., who is here, and Mr. V. E. Larson, of the Phoenix office of the Bureau, who is in charge of the central Arizona studies. Both will testify later.

The central Arizona project area lies in the valleys and flood plains of the Gila River system in Arizona and New Mexico upstream from the vicinity of Gila Bend, Ariz. Archeologists tell us that these fertile valleys were first irrigated by the prehistoric Indians called the Hohokam. Notes made at the time of the explorations by the Spanish in the sixteenth century tell us that the Pima Indians were then irrigating land in the same area. From the time of the arrival of the first padres to the present, irrigation has continued to develop in the project area.

Americans began the development of irrigation from normal stream flows in this region in the latter part of the nineteenth century. By 1900 the need for storage of floodwaters and regulation of stream flows had become obvious. The first such river regulation in the area here under consideration was accomplished by Roosevelt Dam on the Salt River. That dam, one of the first to be started by the Bureau of Reclamation, was completed in 1911.

Subsequently, three other storage dams were built by the Salt River Valley Water Users' Association on the Salt River downstream from Roosevelt Dam. Two storage reservoirs were formed by dams built on the Verde River, one on the Agua Fria, and one reservoir on the main stem of the Gila River.

The continuing increase in the irrigated areas has led to the almost complete development of the surface flows of the Gila River system, and exhaustive development of ground waters. Structures contemplated under the central Arizona project would conserve small additional flows that are susceptible of conservation and provide for maximum utilization of the flow of the Gila River system. This

additional conservation, however, would not provide adequate supplemental water for the area. Additional water must be obtained from some other source if the present agricultural development in the irrigated area that is encompassed by the proposed central Arizona project is to be maintained.

The only remaining source of substantial quantities of water that might be used in the State of Arizona is the Colorado River. Over 30 years ago, when Arizona had been a State but 5 or 6 years, the people of Arizona were discussing plans to divert Colorado River water to central Arizona. Many organizations in the State have advocated one plan or another to accomplish the needed diversion. At first the plans were somewhat vague. Later, the State appointed commissions to study the problem, resulting in more concrete proposals for the development. Then the Bureau of Reclamation was asked to investigate the project under a cooperative agreement with the State of Arizona.

These studies have provided data for the preparation of three reports. The first report, entitled "Comparison of Diversion Routes, Central Arizona Project, Arizona," was issued in September 1945. That report provided the basis for narrowing consideration of alternatives to two general plans, one employing the bridge-canyon or "gravity" route, the other being the Parker or "pumping" route. In February 1947, there was issued a preliminary draft of a report entitled "Report on Feasibility, Bridge Canyon Route, Central Arizona Project," with a supplemental memorandum on the Parker route, and a comparison of the two routes. This report provided the basis for a recommendation that detailed studies be concentrated on the plan employing the Parker route. The third report, issued December 1947, is entitled "Report on Central Arizona Project." It has been prepared in accordance with law; and, together with copies of comments of the interested Federal agencies and States, has been transmited by the Secretary through the President to the Congress. The report sets forth the plans for development of the central Arizona project under the Parker route.

The people of Arizona have long believed that the future of agriculture in Arizona, and thus the basic support of their economy, was directly linked to the Colorado River and the use of its water on lands of the State. Six States, in addition to Arizona, and the United Mexican States, have interests in the Colorado River and its water. A compact has been entered into by the States. A treaty has been entered into between the United States of America and the United Mexican States. Contracts have been entered into between the United States and several States. These documents, as is frequently the case with contracts, are subject to varying interpretations. It is neither the prerogative nor the intent of the Bureau of Reclamation, or Department of the Interior, to adjudicate controversies arising thereunder. In our studies of the central Arizona project, we have used, as a basis for our calculations of available water, the interpretations by officials of the State of Arizona. The State of California challenges the validity of Arizona's claims. It is assumed that the Congress, in considering this proposed project, will give this conflict the full consideration it deserves. The submission of this report is not intended in any way to prejudice full consideration of this controversial matter.

Available water supplies in the central part of Arizona have been greatly overdeveloped. Unless supplemental water is made available, about one-third of the productive capacity of the agricultural land within the potential project area will be lost. Agriculture is the basic support of the economy of the States; the problem, therefore, is serious. Water is needed to replace present overdrafts on the ground-water basin to supplement present surface-water supplies, to provide for replacement of salt-laden waters, and to allow for reactivation of some acreage that is presently idle because of lack of water.

In the Southwest area, consisting of southern California, Arizona, and southern Nevada, there is a pressing need for more electrical energy. Our reserve generating capacity in the Southwest is dangerously low at the present time. A sudden increase in the power demand, such as we experienced during World War II, could not be met. Unless hydro energy can be made available, steam developments must be expanded. This would result in a further drain upon our limited supplies of natural gas and oil which should be conserved wherever possible. The utilization of our available and feasible hydro power potentialities is sound conservation. At the beginning of World War II we had a substantial reserve generating capacity and large storage tanks full of oil. The picture is much different now.

In addition to supplying supplemental water for irrigation and generation of large quantities of electrical energy, the potential project would provide for silt

retention, flood control, river regulation, municipal water supply, recreation, and fish and wildlife propagation.

In view of the urgent need for supplemental irrigation water and domestic water supplies in central Arizona and for additional electrical energy in the Southwest area, we favor authorization of the project, assuming, of course, that it will have a dependable water supply.

Mr. MURDOCK. Now, Mr. Engle, if 15 minutes would suffice, we should be glad to hear you at this time.

Mr. ENGLE. It will, Mr. Chairman.

STATEMENT OF HON. CLAIR ENGLE, A REPRESENTATIVE IN CONGRESS FROM THE STATE OF CALIFORNIA, AND A MEMBER OF THE COMMITTEE ON PUBLIC LANDS

Mr. ENGLE. First, Mr. Chairman, I should like to submit for the record my prepared statement, following which I shall summarize it for the benefit of those who are present this morning.

(The statement referred to is as follows:)

STATEMENT BY CLAIR ENGLE, MEMBER OF CONGRESS FROM CALIFORNIA

Mr. Chairman, as you know, I was forced to leave this committee yesterday while Mr. Knapp was in the midst of his statement. When I left, I understood that Mr. Knapp would be available for me to ask him some questions about certain of the material in his statement. I am now informed that Mr. Knapp has left the city and will not again appear before this committee. Hence, I desire to call the attention of the chairman and of this committee, to certain matters which I would have developed had I had the opportunity to question Mr. Knapp.

Mr. Knapp appeared before us with the identification that he is a very prominent lawyer in Arizona, and I recognize, of course, that he appeared before this committee as an advocate for Arizona and in support of its position in the matter before us. While Mr. Knapp stated that he was not representing the State of Arizona, the entire purport of his statement was in support of Arizona's position.

On page 3 of his statement Mr. Knapp says:

"B. When the division point between the upper and lower basins was agreed upon—to wit, Lee Ferry— the virgin flow of the river at that point was proposed to be apportioned 7,500,000 acre-feet to the upper basin and 7,500,000 acre-feet annually to the lower basin."

Mr. Knapp surely knows that he has not clearly stated what the commissioners and the compact apportioned. I call the committee's attention to the following provisions of the Colorado River Compact, signed at Santa Fe, N. Mex., on November 24, 1922. Article II (a) says:

"The term 'Colorado River system' means that portion of the Colorado River and its tributaries within the United States of America."

Article III (a) reads as follows:

"There is hereby apportioned from the Colorado River system in perpetuity to the upper basin and to the lower basin, respectively, the exclusive beneficial consumptive use of 7,500,000 acre-feet of water per annum, which shall include all water necessary for the supply of any rights which may now exist."

Hence, it appears, Mr. Chairman, and I am sure that Mr. Knapp would not deny it if he were here, that it was not the virgin flow of the river at Lee Ferry that was apportioned. On the contrary, it was the use of the waters of the system—the main stream and its tributaries—that was apportioned. It is important to keep this in mind, Mr. Chairman and gentlemen of the committee, and it is important to remember that the Gila River is a tributary of the Colorado River and is therefore a part of the system, and the use of its waters was a part of the apportionment to the lower basin.

I call your attention to the final words in article III (a) of the compact: "which shall include all water necessary for the supply of any rights which may now exist." There is nobody from Arizona that will deny that full use of the waters of the Gila River was being made prior to the time the compact was signed in 1922. As a matter of fact, two attorneys general of the State of

Arizona in their formal complaints and briefs filed with the United States Supreme Court, one in the case of *Arizona* v. *California* (283 U. S. 423), filed in 1930, and the other *Arizona* v. *California* (298 U. S. 558), filed in 1935, told the Supreme Court that approximately 2,900,000 acre-feet of the waters of the Gila River had prior to 1932 been appropriated and had been put to full consumptive use. So, Mr. Chairman, the closing language in article III (a) of the compact which I have quoted was intended to include the uses that Arizona was then making of the Gila waters at the time the compact was signed. No other conclusion can be arrived at.

In his subdivision C, on page 3 of his statement, Mr. Knapp says:

"* * * it was decided that an additional million acre-feet should be apportioned to the lower basin ostensibly for the purpose of taking care of uses already being made of the Gila River in Arizona."

Whatever may be the reason for that, Mr. Chairman, article III (b) of the compact reads, as follows:

"In addition to the apportionment in paragraph (a), the lower basin is hereby given the right to increase its beneficial consumptive use of such waters by one million acre-feet per annum."

Search as you will, Mr. Chairman, you will not find the words "there is hereby apportioned," nor the words "in perpetuity" in that subparagraph. And, as you know, it is the language that was used in that article III (b) which is the source of one of the points of controversy between Arizona and California. Arizona contends that this million acre-feet was "apportioned" and California claims that "it was unapportioned."

Now you will note, Mr. Chairman, that the "right to increase" set out in article III (b) of the compact was to the lower basin and not to any individual State. I direct your attention—and if Mr. Knapp were here, I would have made him admit—that in 1934 Arizona filed another case in the United States Supreme Court entitled "*Arizona* v. *California et al.*" The decision of the Court is reported in 292 United States 341. In that case Arizona sought leave of the United States Supreme Court to perpetuate the testimony of certain persons to the effect that it was the intention of article III (b) of the compact to apportion that million acre-feet to Arizona exclusively, the basis being that the commissioners who signed the compact had agreed that the million acre-feet was intended for and should go to Arizona to compensate for the waters of the Gila River and its tributaries being included within the definition in the compact of the Colorado River "system." All of the contentions that are set out by Mr. Knapp on pages 7, 8, 9, 10, and 11 were before the Supreme Court, but what did that Court say? I'll tell you what it said. It denied the right of Arizona to perpetuate the testimony saying on page 358 of the decision:

"The considerations to which Arizona calls attention do not show that there is any ambiguity in Article III (b) of the Compact. Doubtless the anticipated physical sources of the waters which combine to make the total of 8,500,000 acre-feet are as Arizona contends, but neither Article III (a) nor (b) deals with the waters on the basis of their source. Paragraph (a) apportions waters 'from the Colorado River System'—i. e., the Colorado and its tributaries—and (b) permits an additional use 'of such waters'. The Compact makes an apportionment only between the upper and lower basin; the apportionment among the states in each basin being left to later agreement. Arizona is one of the states of the lower basin, and any waters useful to her are by that fact useful to the lower basin. But the fact that they are solely useful to Arizona, or the fact that they have been appropriated by her, does not contradict the intent clearly expressed in paragraph (b) (nor the rational character thereof) *to apportion* the 1,000,000 acre-feet to the states of the lower basin and *not specifically to Arizona alone*. It may be that, in apportioning among the states the 8,500,000 acre-feet allotted to the lower basin, Arizona's share of waters from the main stream will be affected by the fact that certain of the waters assigned to the lower basin can be used only by her; but that is a matter entirely outside the scope of the Compact."

There you have it, Mr. Chairman, in very plain language. Anybody can understand that the Supreme Court is saying there that the million acre-feet are not for Arizona exclusively but are for all of the States of the lower basin, and that Arizona's share of waters from the main stream will be affected by the fact that certain of the waters assigned to the lower basin can be used only by her, which means, Mr. Chairman—and Mr. Knapp would have admitted it if I had been able to ask him—that the Supreme Court has said that Arizona's share of the

uses of main-stream waters must of necessity be affected by her uses of the Gila River waters.

Notwithstanding the plain language of the United States Supreme Court that I have quoted above, Mr. Knapp says on page 5 of his statement that:

"Arizona contends the said 1,000,000 acre-feet was apportioned for the sole benefit of Arizona and in recognition of uses and established rights by Arizona over a period of years in the waters of the Gila and its tributaries."

Now, Mr. Chairman, let's be fair about this and I ask that the members of this committee read the decision of the United States Supreme Court from which I have quoted, if there is any question in their minds about what I have said, and then they will see just how much value there is in Arizona's contention that the million acre-feet in article III (b) of the compact was apportioned for her sole benefit and use.

Mr. Knapp, on pages 11 and 12 of his statement, attempts to show that Congress placed a construction on article III (b) of the compact—this same million acre-feet. If Mr. Knapp were here I would ask him to point out to me the language in the Project Act where Congress placed any construction on article III (b) of the compact. Remember, I have quoted to you what the Supreme Court has said—that article III (b) is not ambiguous. Now listen to some more language when the Supreme Court in that same case, on page 358 of the decision, said:

"The provision of article III (b), like that of article III (a) is entirely referable to the main intent of the compact which was to apportion the waters as between the upper and lower basins. The effect of article III (b) (at least in the event that the lower basin puts the 8,500,000 acre-feet to beneficial uses) is to preclude any claim by the upper basin that any part of the 7,500,000 acre-feet released at Lee Ferry to the lower basin may be considered 'surplus' because of Arizona waters which are available to the lower basin alone. *Congress apparently expected that a complete apportionment of the waters among the States of the lower basin would be made by the subcompact which it authorized Arizona, California, and Nevada to make.* If Arizona's rights are in doubt it is, in large part, because she has not entered into the Colorado River compact or into the suggested subcompact."

Now, Mr. Chairman, there is the language of the United States Supreme Court, not that Congress was apportioning any waters between any of the States, but that "Congress apparently expected" that a complete apportionment of the waters among the States of the lower basin would be made "by the subcompact which it authorized Arizona, California, and Nevada to make."

Mr. Knapp says on page 12 of his statement:

"It will be noted that Congress apportions 7,500,000 acre-feet annually to Arizona, California, and Navada out of the main stream, etc."

Mr. Knapp knows better than this. The compact apportions "system" waters between the upper and lower basins, and when Congress was suggesting a subcompact between the States of Arizona, California, and Nevada, it was suggesting a compact as to the uses of "system" waters and not main stream waters. Read it, if there is any question about it. The compact deals with "system" waters, article III (a) of the compact apportions "system" waters, and the language in the second paragraph of section 4 (a) of the Project Act starts out as follows:

"The States of Arizona, California, and Nevada are authorized to enter into an agreement which shall provide (1) that of the 7,500 acre-feet annually apportioned to the lower basin by paragraph (a) of article III of the Colorado River compact, etc."

It is obvious that Congress was suggesting among the States that they enter into a compact as to lower basin "system" waters, and that Congress was not making any apportionment itself. Note the language of the United States Court which I repeat:

"Congress apparently expected that a complete apportionment of the waters among the States of the lower basin would be made by the subcompact which it authorized Arizona, California, and Nevada to make."

Congress was authorizing the States to make an apportionment between themselves. There is not one word in the Project Act which can lead to any other conclusion. Whatever anybody believes about it, the Project Act was approved on December 21, 1928, and in the decision that I have quoted from above the Supreme Court was speaking on May 21, 1934.

Mr. Knapp, on page 12 of his statement, refers to regulations promulgated by Ray Lyman Wilbur, Secretary of the Interior on February 7, 1933, to cover a proposed water-delivery contract between the United States and Arizona, and he

quotes from the contract proposed by the Secretary of the Interior to the effect that there will be delivered to Arizona so much water as may be necessary to enable the beneficial consumptive use in Arizona of not to exceed 2,800,000 acre-feet annually by all diversions effected from the Colorado River and its tributaries below Lee Ferry, and he quotes the words "but in addition to all uses from waters of the Gila River and its tributaries * * *." Mr. Knapp says that this is "recognition" that the Gila uses were solely for Arizona in addition to the apportionment from the Colorado itself. But he did not read far enough, Mr. Chairman. The very next paragraph in the contract "proposed" by the Secretary of the Interior, after the one that Mr. Knapp refers to, reads as follows:

"(a) This contract is without prejudice to the claims of the State of Arizona and States in the upper basin as to their respective rights in and to waters of the Colorado River, and relates only to water physically available for delivery in the lower basin under the terms hereof."

And a later paragraph says:

"(c) It is recognized by the parties hereto that differences of opinion may exist between the State of Arizona and other contractors *as to what part of the water contracted for by each falls within Article III (a) of the Colorado River compact*, what part within Article III (b) thereof, what part is surplus under said compact, what part is unaffected by said compact, and what part is affected by various provisions of section 4 (a) of the Boulder Canyon Project Act. Accordingly, while the United States undertakes to supply water from the regulated discharge of Hoover Dam waters in quantities stated by this contract as well as contracts hereto or hereafter made pursuant to regulations of April 23, 1930, amended September 28, 1931, *this contract is without prejudice to relative claims of priorities* as between the State of Arizona and other contractors within the United States, and shall not otherwise impair any contract heretofore authorized by said regulations."

In a later section of the "proposed" contract is was provided that the contract was made upon the express condition and with the express understanding that all rights thereunder should be subject to and controlled by the Colorado River compact "but is without prejudice to the respective contentions of the State of Arizona and of the parties to said compact, as to interpretation thereof."

Mr. Chairman, the contract "proposed" to be made by the Secretary of the Interior with the State of Arizona to which I have referred was never made. And Mr. Knapp knows it was never made, and, therefore, he cannot fairly say as he did say on page 13 that the "proposed" contract was "a recognition that the Gila water uses were solely for Arizona in addition to the apportionment from the Colorado itself."

Mr. Knapp refers to the contract as actually made by the United States and Arizona on February 9, 1944, and he refers particularly to section 7 (e) to the effect that the contract is for permanent service, etc. He does not tell you that that same contract executed by the United Staes and Arizona on February 9, 1944, in paragraph 7 (h) recites as follows:

"Arizona recognizes the right of the United States and agencies of the State of California to contract for storage and delivery of water from Lake Mead for beneficial consumptive use in California, provided that the aggregate of all such deliveries and uses in California from the Colorado River shall not exceed the limitation of such uses in that State required by the provisions of the Boulder Canyon Project Act and agreed to by the State of California by an act of its legislature (Ch. 16, Statute of California 1929) upon which limitation the State of Arizona expressly relies."

Nor does he tell you about article 10 of that very same contract which says:

"10. Neither article 7, nor any other provision of this contract, shall impair the right of Arizona and other States and the users of water therein to maintain, prosecute, or defend any action respecting, and is *without prejudice to*, any of the respective contentions of said States and water users as to (1) the intent, effect, meaning, and interpretation of said compact and said act; (2) what part, if any, of the water used or contracted for by any of them *falls within article III (a) of the Colorado River compact; (3) what part, if any, is within article III (b) thereof; (4) what part, if any, is excess or surplus waters unapportioned by said compact*; and (5) what limitations on use, rights of use, and relative priorities exist as to the waters of the Colorado River system; provided, however, that by these reservations there is no intent to disturb the apportionment made by article III (a) of the Colorado River compact between the upper basin and the lower basin."

I put it to you, Mr. Chairman and gentlemen, as to whether or not Arizona in

her existing contract, under which she claims the water necessary to serve the central Arizona project, has not reserved to the State of California, and all the other States of the lower basin, their respective contentions as to the intents, effects, meanings, and interpretations of the compact and of the project act.

As a matter of fact, it is a little difficult to follow Mr. Knapp. At the bottom of page 15 of his statement he refers to certain evidence given by Judge Clifford H. Stone of Colorado and he quotes Judge Stone as saying that in this case of *Arizona* v. *California* (292 U. S. 341) the Supreme Court did *not* sustain Arizona's claim that the million acre-feet was specifically apportioned to Arizona alone. After having quoted Judge Stone as he did, Mr. Knapp then goes ahead and submits (on page 16 of his statement) that the compact commission by adding the 1,000,000 acre-feet in article III (b) did so for the sole benefit of Arizona. As I have shown you above, the Supreme Court has passed on this matter and decided it adversely to Arizona.

Now, Mr. Chairman and gentlemen, what I am trying to show you is that there is a serious controversy before you, a controversy that this Congress cannot settle nor is it a controversy that has been already settled in favor of Arizona. As late as February 9, 1944, Arizona in the formal agreement wtih the United States hereinabove mentioned specifically reserved to California all of California's intents, and interpretations of these documents and laws that have been referred to as the "law of the river." I repeat: the Colorado River compact dealt with "system" waters; any and all apportionments in the compact were of "system" waters; the Gila River as a tributary of the Colorado River is a part of the "system;" and the Gila waters were intended to be, are and have been held by the Supreme Court of the United States to be a part of the "system" waters.

Mr. Knapp in his statement devoted considerable time in giving you his ideas as to what was meant by "beneficial consumptive use" and what the California Limitation Act really means. I submit, Mr. Chairman and gentlemen, that all that Mr. Knapp was doing was setting forth his own ideas and he was frank to admit to my colleague, Mr. Poulson, that it is the diverse interpretation by lawyers of documents before them that lead to lawsuits and that only the Court can determine those lawsuits. The dispute between Arizona and California as to "beneficial consumptive use"—what does it mean—and the extent to which California is bound by its limitation act are just as real as the other matters that I have already referred to. There is a real dispute between these States, and as the Secretary of the Interior has said, and I have already read you his words, if California's contentions are correct there is no water for the central Arizona project.

Mr. ENGLE. I regret, Mr. Chairman, to make my comments on Mr. Knapp's testimony in his absence. It is always better to comment on some other person's statements in his presence, so that he may have an opportunity to answer.

I have handed to each of the committee members a copy of my statement, which I have offered for the record. I do not intend to read it, but shall summarize it and call the committee's attention to some of the significant parts of it. Also I have handed to members of the committee a copy of Mr. Knapp's statement in order that they may follow my comments.

On page 3, paragraph B, Mr. Knapp makes the following statement:

> When the division point between the upper and lower basins was agreed upon, to-wit: Lee Ferry, the virgin flow of the river at that point was proposed to be apportioned 7,500,000 acre-feet to the upper basin, and 7,500,000 acre-feet annually to the lower basin.

The other day I pointed out to the committee that it was not the virgin or any flow in the river which was apportioned under the basin compact. It was the water in the river system, and as my authority for that, I cited the language of the compact itself. If you will turn to page 2 of my statement, at the top of the page, there is a quotation from article II (a) of the compact defining the term "Colorado River system." It says:

The term "Colorado River system" means that portion of the Colorado River and its tributaries within the United States of America.

Then article III (a) says:

There is hereby apportioned from the Colorado River system—

I call your attention to that, gentlemen. Article III (a) refers to the Colorado River system which was defined in article II (a) to be the Colorado River and its tributaries within the United States of America, and it is that system which is apportioned in perpetuity under article III (a) to the upper basin and the lower basin, respectively. The language is:

There is hereby apportioned from the Colorado River system in perpetuity to the upper basin and to the lower basin, respectively, the exclusive beneficial consumptive use of 7,500,000 acre-feet of water per annum, which shall include all water necessary for the supply of any rights which may now exist.

In other words, Mr. Knapp's statement on page 3 that it is the virgin flow of the river at Lee Ferry which was apportioned 7,500,000 acre-feet to the lower and 7,500,000 acre-feet to the upper basin, is not correct and is not in conformity at all with the express provisions of the compact, which defines the Colorado River system and which makes a division of the beneficial use of the waters in the system, not in the main stream.

That may not seem to be very important or relevant now, but as your thinking on this subject develops I am sure that the significance of it will become more apparent.

Now we turn to page 5 of Mr. Knapp's statement, at the bottom of the page, where he says:

"Why did the Compact Commission increase the beneficial consumptive use by 1,000,000 acre-feet per annum to the lower basin, as provided in article III (b) of the compact?

"Arizona contends the said 1,000,000 acre-feet was apportioned for the sole benefit of Arizona and in recognition of uses and established rights by Arizona over a period of years in the waters of the Gila and its tributaries."

On page 6 of his statement, under contention 1 he repeats that statement saying with reference to the 1,000,000 acre-feet that it was apportioned solely for the benefit of Arizona and in recognition of uses and established rights by Arizona in the Gila River, and not surplus waters as California contends.

Then Mr. Knapp proceeds for some 15 pages to cite what he considers authority in support of that proposition.

Now I refer you to the bottom of page 15 of Mr. Knapp's statement where he quotes the Supreme Court of the United States against himself on that very proposition. At the bottom of the page he quotes Judge Stone as follows:

In *Arizona* v. *California* (292 U. S. 341), the Court did not sustain Arizona's claim that the million acre-feet covered by III (b) water was specifically apportioned to Arizona alone.

Now let us go back again and look at page 6 so we can tie the two together. On page 6, under contention 1 he states that it is apportioned waters in recognition solely of Arizona's uses and rights in the Gila River. Then on page 15 he cites the United States Supreme Court in diametric opposition to the very point that he is trying to

make. Then if you want to see complete incongruity in this statement, turn to page 16 and read the third paragraph under (a) in which he says this:

Arizona respectfully submits that the foregoing records show conclusively that:

(a) The Compact Commission, in adding III (b) 1,000,000 acre-feet to the compact, did so for the sole benefit of Arizona—

But if you go back to the preceding paragraph you find him saying, in *Arizona* v. *California* that the Court did not sustain Arizona's claim that the million acre-feet covered by III (b) water was specifically apportioned to Arizona.

Mr. MURDOCK. Will the gentlemen yield for just a moment? I do not want to interrupt the gentleman's statement, but I just wanted to flag this one thing; I see no inconsistency there and when further time permits I think it can be shown that the Supreme Court said that the water is not apportioned to Arizona, and Judge Knapp was not contending that it was apportioned to Arizona specifically, but was apportioned water, meaning apportioned to the lower basin.

I am sorry for the interruption.

Mr. ENGLE. Let us return to page 6 of Mr. Knapp's statement and I shall read it again.

It is apportioned water in recognition solely of Arizona's uses and rights in the Gila River—

And on page 5, at the bottom of the page, he says.

Arizona contends the said 1,000,000 acre-feet was apportioned for the sole benefit of Arizona and in recognition of uses and established rights by Arizona over a period of years—

Then after 16 pages of authority he cites the Supreme Court against himself on the proposition which he has been endeavoring in this brief to establish.

Now let us go back and find out what happened. Arizona brought a suit in the Supreme Court to perpetuate certain testimony; that is the testimony to which Mr. Knapp has alluded in those 15 pages, in support of the proposition that this was water apportioned for the sole benefit of Arizona. The Supreme Court not only did not sustain the position of Arizona but went on to say that the language of III (b) was perfectly clear and denied the right to perpetuate this testimony, which is cited in these 15 pages, on the ground that it was wholly irrelevant, in view of the fact that the language of the compact itself was clear and unambiguous and therefore not subject to interpretation by collateral testimony of any type.

Let me read to you the language of the Supreme Court in which it denied the right of Arizona to perpetuate this testimony which is set forth in these 15 pages of brief. I am quoting from page 385 of the decision, and you will find it on page 4 of my statement.

The considerations to which Arizona calls attention do not show that there is any ambiguity in article III (b) of the compact.

That is what I am talking about. They tried to perpetuate testimony for the purpose of explaining the reason for III (b) waters in the compact and the Court said that—

The considerations to which Arizona calls attention do not show that there is any ambiguity in article III (b) of the compact. Doubtless the anticipated

physical sources of the waters which combine to make the total of 8,500,000 acre-feet are as Arizona contends—

You will recall that I read you the other day from Mr. Acheson's brief on that subject.

but neither article III (a) nor (b) deals with the waters on the basis of their source. Paragraph (a) apportions waters "from the Colorado River System"—

That is just what I was talking about here a few mintue ago—

the Colorado and its tributaries and (b) permits an additional use "of such waters." The compact makes an apportionment only between the upper and lower basin;—

It is not an apportionment of the stream flow, virgin or otherwise, at Lee Ferry. As the Supreme Court says, it is an apportionment between the upper and lower basin of the stream's system, the Colorado River System, which is the Colorado River and its tributaries—

the apportionment among the States in each basin being left to later agreement. Arizona is one of the States of the lower basin and any waters useful to her are by that fact useful to the lower basin.

In other words, the additional 1,000,000 feet, useful to the basin, is useful to her.

But the fact that they are solely useful to Arizona—

Now, listen to this statement—

But the fact that they are solely useful to Arizona, or the fact that they have been appropriated by her, does not contradict the intent clearly expressed in paragraph (b) (nor the rational character thereof) to apportion the 1,000,000 acre-feet to the States of the lower basin and not specifically to Arizona alone.

Now, here is something very significant—

It may be that, in apportioning among the State the 8,500,000 acre-feet allotted to the lower basin, Arizona's share of waters from the main stream will be affected by the fact that certain of the waters assigned to the lower basin can be used only by her—

That is the Gila River; it cannot refer to anything else.

but that is a matter entirely outside the cope of the compact.

Mr. REGAN. Will the gentleman yield there?

Mr. ENGLE. Yes.

Mr. REGAN. Was the apportionment of the 7,500,000 acre-feet of water based on the additional 1,000,000 feet of the Gila River? When you divide the water 4,400,000 against 2,800,000—my understanding is that that was the division—of the 7,500,000 acre-feet. It went 4,400,00 to California and 2,800,000 to Arizona and 300,000 to Nevada. The difference there would be 1,600,000 acre-feet. Was not the Gila River water given consideration in arriving at that division of water, of the 7,500,000 acre-feet in the Colorado?

Mr. ENGLE. I do not think so. I think that it may have had some bearing, but it was not the essential thing.

I have here before me a statement by Mr. Sloan, who was the legal adviser to the Colorado Compact Commission for Arizona, which was made in 1923, shortly after the compact was entered into and reprinted from the Arizona Mining Journal. As far as we know, there is no official statement made to the Arizona Legislature. But here is what he said. He said that the needs of each basin were arrived at and then 1,000,000 acre-feet added. I am quoting now from the

appendix page A–69, the statement of Sloan of Arizona, contained in a book entitled "The Hoover Dam Documents," which is House Document 717 of the Eightieth Congress. He says that:

The known requirements of the upper basin being placed at 6,500,000 acre-feet, a million acre-feet of margin gave the upper basin an allotment of 7,500,000 acre-feet. The known future requirements of the lower basin from the Colorado River proper were estimated at 5,100,000 acre-feet. To this, when the total possible consumptive use of 2,350,000 acre-feet from the Gila and its tributaries are added, gives a total of 7,450,000 acre-feet. In addition to this, upon the insistence of Mr. Norviel, 1,000,000 acre-feet was added as a margin of safety, bringing the total allotment for the lower basin up to 8,500,000 acre-feet.

In other words, they took the total uses of each basin and added a cushion of 1,000,000 acre-feet to each one. That is how they arrived at their figure.

I can make this available to you, if you want to read it; it is not a very long statement. But I should like to move along if I may.

Mr. Knapp proceeded then to discuss certain proposed contracts. He did not say what was in all of those contracts and you must remember that a proposed contract is not a contract. But when Arizona actually entered into a contract in 1944 with the Secretary of the Interior—and I ask you now to refer to page 9 of my statement where you will see what was written in article 7 and article 10 of this contract. There is a very specific reservation of all rights. It says:

Neither article 7, nor any other provision of this contract, shall impair the right of Arizona and other States and the users of water therein to maintain, prosecute or defend any action respecting, and is without prejudice to, any of the respective contentions of said States and water users as to (1) the intent, effect, meaning, and interpretation of said compact and said act; (2) what part, if any, of the water used or contracted for by any of them falls within article III (a) of the Colorado River compact; (3) what part, if any, is within article III (b) thereof—

And this is just what we are talking about—

(4) what part, if any, is excess or surplus waters unapportioned by said compact; and (5) what limitations on use, rights of use, and relative priorities exist as to the waters of the Colorado River system.

In other words, contrary to what Mr. Knapp says, that these contracts offered and finally entered into are any interpretation at all of the basic disagreements between California and Arizona, the contract finally entered into recognizes the conflict and respects the right of each side with respect to those disagreements.

Now, my time is running out and I want to add just one further proposition. Mr. Knapp devoted himself at some length to the discussion of the meaning of beneficial consumptive use.

I want to get into that a little later because I feel sure that my friend, Mr. Lemke, who is a very splendid lawyer, is somewhat confused.

I want to call the committee's attention to this, that on page 19 of Mr. Knapp's statement, he cites the upper basin States compact, approved by this committee as proof of their interpretation of the consumptive beneficial use of the water.

The members of this committee know that witness after witness got on the stand here and testified that the consent by Congress to this upper-basin States compact was in no sense an interpretation by the Congress as to the meaning of the upper basin compact. They were so sure on that point that they wrote it into the report in specific lan-

guage, and it was reiterated on the floor of the House and reiterated on the floor of the Senate. It was left out of the language of the compact itself for the reason that Mr. Breitenstein of Colorado contended that if there was any disclaimer in the bill it might be construed.

That is all I have to say with reference to that portion of Mr. Knapp's statement on this subject, except to say that his further arguments are just as specious as that one is. And within the knowledge of the committee the members know that it was not the intention of the Congress to give any such implication to the Colorado River compact in giving this consent to that compact.

Mr. Chairman, I could continue for much longer, but I have already taken 2 minutes more than I had intended to this morning, and I very much appreciate the attention you have given me.

Mr. MURDOCK. According to the agreement made at the beginning of the session we will adjourn at this hour, because this is the hour set for the funeral of our former chairman of this committee. The committee will stand adjourned subject to the call of the chairman, but later than the Easter recess.

(At 10:32 a. m. the committee adjourned subject to the call of the chairman.)

91190—49—ser. 11, pt. 1——26

THE CENTRAL ARIZONA PROJECT

WEDNESDAY, APRIL 27, 1949

HOUSE OF REPRESENTATIVES,
SUBCOMMITTEE ON IRRIGATION AND RECLAMATION OF
THE COMMITTEE ON PUBLIC LANDS,
Washington, D. C.

The subcommittee met, pursuant to adjournment, at 10 a. m., in room 223, House Office Building, the Honorable John R. Murdock (chairman of the subcommittee) presiding.

Mr. MURDOCK. I believe the subcommittee is ready to proceed now, although I wish we had a full attendance this morning.

We will proceed with the hearing on H. R. 934, after the Easter recess. Our next division of testimony will be the affirmative presentation of the matter by the Bureau of Reclamation.

I might say for the benefit of the press that there are two other subcommittees besides this subcommittee of the Public Lands Committee meeting this morning, which illustrates how crowded we are for time and space. I hope all may be comfortable.

Furthermore, this subcommittee must adjourn to the main committee room at 11:40 this morning to meet with the full committee for a few minutes before the House convenes today.

With that understanding, and with regret that we do not have more room and a larger attendance to hear this important testimony, I will call on Mr. V. E. Larson, assistant planning engineer of the Bureau of Reclamation in region III.

Mr. Larson, before you begin your statement may I say that thus far we have stressed the need of water in central Arizona, which we felt was basic in support of this legislation. Several members of the committee have said to me that they are convinced of the need, and they would prefer from now on to hear the testimony concerning the availability of water for the project, the physical availability, and of course the legal availability.

We have with us the engineer, who can, I presume and I hope discuss the physical availability, Mr. Larson.

STATEMENT OF V. E. LARSON, ASSISTANT REGIONAL PLANNING ENGINEER FOR REGION III, BUREAU OF RECLAMATION, DEPARTMENT OF THE INTERIOR

Mr. LARSON. Mr. Chairman and members of the committee, my name is V. E. Larson, assistant regional planning engineer for region III of the Bureau of Reclamation in immediate charge of investigations of the central Arizona project for the Bureau.

The findings and recommendations of the Bureau of Reclamation

resulting from the investigations of the central Arizona project have been outlined briefly in the statement presented for the record by the Commissioner and regional director. I will expand on these informative statements by presenting factual data compiled by the Bureau.

The potential central Arizona project, when viewed in the light of all the facilities required to make it an effective development, embraces an area that extends to all boundaries of the State of Arizona as can be observed from a glance at the general location map. There are copies of the maps and charts attached to these statements. There is a general location map prepared by Arizona. We do not have a copy of our general location map. I imagine it is over in the other committee room, but this shows the location of all potential developments.

Mr. MURDOCK. Off the record.

(Discussion off the record.)

Mr. MURDOCK. Proceed, Mr. Larson.

Mr. LARSON. In two cases, however, the project features extend beyond these borders into the States of Utah and New Mexico.

Relative to the prime purpose of the project, irrigation, the area embraced, as generally discussed, consists of approximately 672,000 acres of highly fertile and productive farm land on the flood plains and in the valleys of the Gila River system extending upstream from the vicinity of Gila Bend. These lands are represented by the shaded portions of the agricultural area map included in the report. This area represents 80 percent of the land irrigated in Arizona. Due to the existence of favorable temperatures, diversified cropping is practiced throughout the year.

Events responsible for the advancement of this investigation to its current status stem from the decline of irrigation water supplies as related to a growing agricultural economy in the project area. For the past 25 years, a number of plans have been advanced by various groups for the diversion of Colorado River water to central Arizona. The Bureau of Reclamation initiated preliminary investigations of a potential diversion route late in 1940.

In February 1944 the Arizona State Legislature, mindful of the growing water shortage in central Arizona, appropriated $200,000 to be used in cooperation with the Bureau of Reclamation to make surveys, investigations, and compilations of the water resources of the State and their potential development. A like sum for the same purpose was allocated by the Bureau, from its investigation funds, and a formal agreement on procedure was executed July 31, 1944.

The purpose of these specific investigations has been to develop the best means by which Colorado River water could be diverted to central Arizona to alleviate a mounting and critical shortage of water. The Colorado River is the only remaining source of water within the State capable of meeting these shortages. Concurrently with this concentrated study, other investigations have been conducted relating to improvement in the utilization of existing water supplies in the project area.

On the basis of previously accumulated data, the Bureau, in 1944, selected three plans for diversion of water from the Colorado River which merited further investigation. On the general location map

they are designated as the Marble Canyon, Bridge Canyon, and Parker routes. That is the second map.

Investigations by the Bureau of Reclamation indicate that under present conditions the Parker route is the most economical, therefore, this route was adopted and made a part of the plan of development as presented in the report on the central Arizona project, copies of which have been made available to this committee. This report has come to the Congress through proper channels in accordance with the Flood Control Act of 1944.

The investigation of any multiple-purpose reclamation project involves the analysis of four fundamental elements. They are: (*a*) Need for the project; (*b*) available water supply; (*c*) plan of development to serve the needs; and (*d*) economic feasibility of the project. My testimony will treat these elements in that order.

Need for the project: Farming in the project area is impossible without irrigation. Rainfall in the vicinity of Phoenix averages about 8 inches annually. In addition to rainfall, the optimum irrigation requirement is an average delivery to the farm of 4 acre-feet of water per acre per year.

The first canal built by white men in the area was constructed in 1867. Other canals were completed later, although it was not until the enactment of the Reclamation Act in 1902 by the Congress, and the completion thereunder in 1911 of Roosevelt Dam on the Salt River, that the present-day agricultural economy was established. Closely following developments on the Salt River were similar developments in various locations on the middle and upper Gila River system. Practically all of the surface run-off in the area is now regulated and utilized for irrigation.

Some years ago a drainage problem developed in the lower reaches of the project area. It was found that this drainage problem could be corrected by drilling wells and pumping water from the ground-water basin. This pumped water was satisfactory for irrigation and during the ensuing period pumped water has represented an increasing percentage of the annual irrigation supply. The stage has been reached where agricultural development has expanded beyond the water supply now available and people of the area are looking to the last source of supply, the Colorado River. For the past 25 years representatives of the State of Arizona, local organizations and individuals have made investigations looking to diversion of Colorado River water into the area at such time as that source of supply was needed. That requirement has now been reached. In fact, without Colorado River water about one-third of the productive capacity of the agricultural development will be lost which will result in large scale abandonment and migration. Agriculture is the basic support for the existing economic structure in the State of Arizona. The possibility of losing a third of this support naturally presents a grave problem to the State.

The need of additional water for irrigation in the central Arizona project area is fourfold. Additional water is needed (1) to relieve the ovedraft on the ground-water basins; (2) to provide a supplemental supply to lands now in production, but not adequately irrigated; (3) to permit the drainage of excess salts out of the area and maintain a salt balance; and (4) to provide water for land irrigated in the past but now idle for the lack of water.

For the period of 1940 to 1944, the pumping overdraft is estimated from available information to have averaged about 468,000 acre-feet a year. This period is representative of the long-time water-supply conditions in the area; therefore, it is believed that this estimate of overdraft is within reasonable limits.

Many acres of land now in cultivation receive a deficient supply of water. This results in a reduction of the crop yield and in some cases has resulted in crop failures. When the delivery of water is less than optimum, the productive capacity of the land is reduced.

When irrigation water is applied to the land a large part is consumed in plant growth, transpiration, and evaporation, leaving practically all its mineral salts concentrated in the water percolating to the ground-water supply. With each successive reuse by pumping, the salt content is further concentrated. In some localities the water is becoming concentrated with mineral salts toward the point where the water is toxic to vegetation. Such areas will spread through the ground-water basin unless the progress in salt concentration is stopped. Surface waters diverted to the area each year are estimated to contain 846,000 tons of mineral salt. Local experience indicates that water containing concentrations in excess of 5½ tons of salt in an acre-foot of water is detrimental to crops. To maintain a favorable salt balance it then becomes necessary to release from the area an annual flow of 154,000 acre-feet of salt-charged water.

The maximum acreage that has ever been irrigated in the central Arizona project area, up to 1945, is about 672,000 acres. Because of water shortages in the area a portion of that acreage lies idle. The average acreage irrigated during the period 1940–44 was about 566,000 or 106,000 acres below the maximum. Additional water is required if this acreage or a portion thereof is to be returned to a productive status.

Municipal water supply: The growth of the city of Tucson and adjacent residential areas has developed a critical problem of domestic water supply. The ground-water basin now serving this city is overdrawn and supplemental supplies from other sources must be developed. It is estimated that a diversion of 12,000 acre-feet a year would be required to furnish the city of Tucson with an adequate municipal water supply.

Electrical-energy requirements: There is an urgent and measurable need for additional electrical energy in Arizona, southern California, southern Utah, and southern Nevada. This area has experienced a critcal power shortage during recent years and appropriate indexes indicate a rapidly expanding demand in the future. The situation is illustrated by the chart labeled "Estimated energy requirements and supply." A copy of that chart is also attached.

Present power developments in this power market area range from large hydroelectric and fuel-burning plants to small power plants in isolated camps and towns. Hoover and Parker plants on the Colorado River constitute a large source of low-cost power for southern California, southern Nevada, and Arizona. When generating units, in the area, now under construction or authorized have been completed, the total installed capacity available to the power market area will exceed 3,000,000 kilowatts.

The population of the power market area is in excess of 4,500,000

and the average annual per capita consumption is 2,400 kilowatt-hours. Total annual power consumption has grown from 1.5 billion kilowatt-hours in 1920 to an annual usage of almost 14 billion kilowatt-hours in 1947.

At the present time approximately 58 percent of the electrical energy consumed in the referenced area is supplied by fuel-burning plants. The fuel consists mainly of oil and natural gas. The availability in the area of these natural resources is limited and the need of greater conservation is a reality. Utilization of hydropower potentialities where economically feasible would result in a considerable saving of these national resources.

Available water supply—General: The central Arizona project contemplates further use of the waters of the Verde, the Gila, and the San Pedro Rivers, together with importation of water from the Colorado River.

Colorado River water: In the determination of the amount of water available for diversion to the central Arizona project from the Colorado River, consideration must be given to the over-all amount of water available in the stream. The Colorado River compact apportioned waters of the Colorado River between the upper and lower basins, designating "Lee Ferry," on the Colorado River, 1 mile below the mouth of the Paria River, as the point of division. The apportionment of Colorado River waters by the Colorado River compact is from the virgin or undepleted flow of the stream, that is, from the stream as would be in the absence of any development. The following table presents for the period 1897–1943, inclusive, the estimated average annual virgin flow at Lee Ferry and other points downstream to the international boundary.

Average annual flows for 1897 to 1943, inclusive, under virgin conditions: Flow at Lee Ferry, 16,270,000 acre-feet. Gain, Lee Ferry to Hoover Dam, 1,060,000 acre-feet. Flow at Hoover Dam, 17,330,000 acre-feet. Tributary inflow, Hoover Dam to international boundary: Williams River and minor washes, 150,000 acre-feet. Gila River at mouth, 1,270,000 acre-feet. Subtotal, 1,420,000 acre-feet. Less natural main stream channel losses, 1,030,000 acre-feet. Gain, Hoover Dam to international boundary, 390,000 acre-feet. Colorado River at international boundary, 17,720,000 acre-feet.

Potential projects in the upper basin could, apparently, fully utilize the 7,500,000 acre-feet apportioned to the upper basin by the Colorado River compact. It is also quite possible that the upper basin could utilize that part of the surplus flows which could be apportioned to the upper basin under provisions of article III (f) of the compact. Conservatism in making any determination of the availability of water under ultimate conditions requires that it be assumed that the average anual flow of the Colorado River at Lee Ferry will be decreased by 7,500,000 acre-feet plus any water apportioned to the upper basin under article III (f) of the compact. The following tabulation has been prepared to present an analysis of the present apportionment of the waters of the Colorado River:

Virgin flow, Colorado River at international boundary, 17,720,000 acre-feet. Apportioned to upper basin by article III (a) of the Colorado River compact, 7,500,000 acre-feet. Apportioned to lower basin by article III (a) of compact, 7,500,000 acre-feet. Apportioned

or allocated to lower basin by article III (b) of compact, 1,000,000 acre-feet. Estimated delivery to Mexico pursuant to treaty, 1,500,000 acre-feet. Total apportioned and/or allocated water, 17,500,000 acre-feet. Indicated surplus water, 220,000 acre-feet.

In the absence of a compact as to the division of water among the various States involved, the determination of Colorado River water available for diversion to the central Arizona project herein presented is based upon interpretations by responsible officials of the State of Arizona. This presentation is not intended to be prejudicial to the claims of the States challenging Arizona's interpretations. The Bureau of Reclamation recognizes these differences of opinion, but, as has been stated in our report, the Bureau cannot authoritatively resolve those differences.

Arizona contends that 8,500,000 acre-feet of water are apportioned to the lower basin in the Colorado River compact, of which California may use not to exceed 4,400,000 acre-feet of water under its Limitation Act of March 4, 1929. Nevada has a contract for the use of 300,000 acre-feet of apportioned water, which is adequate for her potential developments. That would leave 3,800,000 acre-feet of apportioned water for use by Arizona.

Arizona officials recognize the rights of Utah and New Mexico to the use of waters in the lower basin, such use to be deducted from that portion allocated to Arizona. It is estimated that ultimate development by New Mexico will deplete the Little Colorado River by 13,000 acre-feet and the Gila River by 16,000 acre-feet. Under ultimate development, it is estimated that Utah will deplete the Virginia River by 94,000 acre-feet and Kanab Creek by 7,000 acre-feet. Ultimate depletions in the lower basin by these States are thus 29,000 by New Mexico and 101,000 by Utah, or a total of 130,000 acre-feet.

As provided in article III (f) of the compact, further equitable apportionment of the unapportioned water of the Colorado River will be made after October 1, 1963. The unapportioned water is estimated as 220,000 acre-feet a year. It is assumed that one-fourth of the unapportioned water, or 55,000 acre-feet, will be made available to Arizona.

On the basis of these assumptions, Arizona's share of the Colorado River under ultimate conditions is summarized as follows:

Water from article III (a) and (b), 3,800,000 acre-feet. Less use by New Mexico and Utah in lower basin, 130,000 acre-feet. Net water available from article III (a) and (b), 3,670,000 acre-feet. One-fourth share of surplus water, 55,000 acre-feet. Total available for Arizona, 3,725,000 acre-feet. Of this 3,725,000 acre-feet of water, the central Arizona project can utilize the part that remains after deducting the amount now being utilized, the amount that will be utilized in the future by other projects elsewhere in the State, and main-stream reservoir losses chargeable to Arizona.

Evaporation losses from the surfaces of the reservoirs required for the complete utilization of the water resources of the Colorado River will represent a material depletion in the flow of the river. It is estimated that under ultimate conditions about 900,000 acre-feet of water will be lost annually to evaporation from main-stream reservoir surfaces in the lower basin. This amount is in addition to the quantities lost from the same areas prior to the creation of any reservoirs. In-

asmuch as these losses represent a depletion of the water supply of the lower basin as a whole, Arizona assumes that these losses would be apportioned between the various States of the lower basin on an equitable basis. It is the contention of Arizona that a just method of apportionment would be to charge California, Nevada, and Arizona with these main-stream reservoir losses in the ratio that these States receive water from the Colorado River, exclusive of uses of tributaries in the lower basin.

On this basis, with main-stream reservoir losses of 900,000 acre-feet, Arizona would be charged with 313,000 acre-feet a year.

In addition to present depletions by Arizona, there are potential irrigation projects other than the central Arizona project which would utilize a part of Arizona's share of the Colorado River water. These potential developments and contemplated expansion of projects now in a construction stage are recognized as potential units in a basin-wide plan of development.

Under ultimate development, it will be necessary to release water from the central Arizona project area to carry out excess salts and maintain a salt balance. The net effect of such release would increase the annual return to the Colorado River about 123,000 acre-feet.

The following table has been prepared to summarize the present and future depletions and reservoir losses chargeable to the State of Arizona and to aid in computing the amount of water available for the central Arizona project: Total available for Arizona, 3,725,000 acre-feet: Less: Main-stream reservoir losses (present and future), 313,000 acre-feet. Present depletions: Gila River Basin, 1,135,000 acre-feet; Little Colorado River Basin, 59,000 acre-feet; Virgin River and Kanab Creek, 5,000 acre-feet; Williams River Basin, 3,000 acre-feet: Colorado River below Parker Dam, 206,000 acre-feet; subtotal, 1,408,000 acre-feet.

Future depletions: Gila River Basin, 20,000 acre-feet; Little Colorado River Basin, 10,000 acre-feet; Virgin River, 12,000 acre-feet; Colorado River below Parker Dam, 851,000 acre-feet; unassigned water, 34,000 acre-feet; subtotal, 927,000 acre-feet; 2,648,000 acre-feet.

Potential depletion by central Arizona project, 1,077,000 acre-feet. Plus increase in return to Colorado River through Gila River by reason of central Arizona project development, 123,000 acre-feet. Available for diversion to central Arizona project, 1,200,000 acre-feet.

Additional Gila Basin water: The enlargement of Horseshoe Reservoir on the Verde River from its present capacity of 68,000 acre-feet to a capacity of 298,000 acre-feet would impound floodwaters which cannot now be put to beneficial use. The enlarged capacity would provide an additional average yield from the Verde Reservoir system of 42,000 acre-feet a year.

The construction of Buttes Dam on the Gila River would impound floodwater and tributary inflow below Coolidge Dam which cannot now be put to beneficial use in the middle Gila area. Buttes Reservoir would provide an additional average yield of 64,000 acre-feet annually for use in the middle Gila area.

Developments could be provided in the upper Gila area which would permit more efficient irrigation practices. The net effect of these developments would be to provide 19,000 acre-feet of supplemental water for this area.

A dam could be constructed at the Charleston site on the San Pedro River to provide regulation of the stream. Stored water would provide a supplemental irrigation supply for the area and a municipal water supply for the city of Tucson. It is estimated that this development would conserve 7,000 acre-feet of water which otherwise would be lost in the river channel.

Total new water: The following table has been prepared to summarize the new water developed under the central Arizona project: Colorado River, 1,200,000 acre-feet. Less aqueduct losses, 250,000 acre-feet. Balance, 950,000 acre-feet. Developed on Verde River by Horseshoe Dam enlargement, 42,000 acre-feet. Developed on Gila River: Buttes Dam, 64,000 acre-feet. Developed in upper Gila area, 19,000 acre-feet. Total 83,000 acre-feet. Developed on San Pedro River by Charleston Dam, 7,000 acre-feet. Total new water developed 1,082,000 acre-feet.

On the basis of the above analysis 1,082,000 acre-feet of new or additional water would be available for utilization in the potential central Arizona project.

Plan of development to serve the needs—Project features: Primarily the central Arizona project would provide Colorado River water to the central part of the State. This would be accomplished by pumping from Lake Havasu behind Parker Dam, into a canal which would extend to the existing Granite Reef Dam located about 3 miles below the junction of the Verde and Salt Rivers. In order to effect full development for the area, a number of works would be constructed in the States of Arizona, Utah, and New Mexico.

For convenience in discussion, the central Arizona project has been segregated into 17 units, or features, listed as follows:

1. Bluff Dam.
2. Coconino Dam.
3. Bridge Canyon Dam and power plant.
4. Havasu pumping plants.
5. Granite Reef aqueduct.
6. McDowell pumping plant and canal.
7. McDowell Dam and power plant.
8. Horseshoe Dam enlargement and power plant.
9. Salt-Gila aqueduct.
10. Buttes Dam and power plant.
11. Charleston Dam.
12. Tucson aqueduct.
13. Safford Valley improvements.
14. Hooker Dam.
15. Irrigation distribution system.
16. Drainage system for salinity control.
17. Power transmission system.

The necessity for all of these features may not be apparent at first; let us, therefore, consider their relationship. Approximately 1.5 billion kilowatt-hours of energy will be required annually for project pumping. There is no surplus energy presently available in the area, and certainly no prospect of private development involving output of this magnitude. Accordingly, Bridge Canyon Dam and power plant would be constructed on the Colorado River, 117½ miles upstream from Hoover Dam. Roughly one-third of the power developed at this

site would be utilized to operate the pumping plants needed to raise the water from Havasu Lake for delivery to central Arizona. The remainder would be sold to the power market at a rate sufficient to provide revenue to repay the costs of this power development and a portion of the costs of the irrigation developments needed under the central Arizona project.

Located in a deep canyon, the Bridge Canyon Reservoir would have a comparatively small capacity, totaling 3,720,000 acre-feet. Silt inflow to this reservoir would amount to about 127,000 acre-feet a year. Unless preventive measures were taken, this silt would infringe on the active storage capacity of the reservoir. In addition, the capacity of Bridge Canyon Reservoir would be so limited that it appears desirable to provide upstream river regulation to permit maximum utilization of this site. Studies of stream flow at the Bridge Canyon site, when considered in conjunction with design costs, indicate that upstream flood-control storage would be highly desirable in order to reduce the costs of spillway construction at the Bridge Canyon Dam.

For the foregoing reasons, two upstream reservoirs have been considered as essential adjuncts to the Bridge Canyon Dam. The farthest upstream of these is Bluff Dam, on the San Juan River. This dam would be located about 12 miles downstream from Bluff, Utah. It would be tripurpose, in that it would provide flood control, silt retention, and regulation of stream flow. The San Juan River now contributes about 23 percent of the total silt load of the Colorado River at the Bridge Canyon Dam site.

A dam at the Coconino site on the Little Colorado River would be constructed about 49 miles upstream from the mouth of that stream as a second adjunct to the Bridge Canyon development. This structure would impound 22 percent of the silt load of the Colorado River at the Bridge Canyon Dam site, and, in addition, would provide flood-control storage capacity.

As previously stated, part of the power generated at the Bridge Canyon development would provide energy to operate the Havasu pumping plants. These pumping plants would be located along the extreme western 20 miles of the Granite Reef aqueduct. Four in number, they would raise the water, by a series of lifts, a total of 985 feet.

Granite Reef aqueduct would consist of approximately 241 miles of open concrete-lined canal, leading from Lake Havasu to Granite Reef Dam. The westernmost 25 miles of the aqueduct would traverse extremely rugged terrain. The remainder of the canal would be located in typical desert country, skirting occasional small mountain ranges. Major siphon crossings would be required at Cunningham Wash, Centennial Wash, and the Hassayampa, Agua Fria, and New Rivers. The aqueduct would terminate in the pool above the existing Granite Reef diversion dam. Diversions would be made from the aqueduct as needed to supply requirements on lands located in the western portion of the project area.

The achievement of maximum efficiency necessitates operation of the Havasu pumping plants and Granite Reef aqueduct at a continuous rate in order that a minimum design capacity may be adopted. For this reason, these features would be designed to operate at a capacity of 1,800 cubic feet per second at all times except for 1 month

each year, at which time diversion could be entirely discontinued to allow for maintenance and repairs to the canal and pumping plants. Under such a system, deliveries to the project area would exceed irrigation demands during the winter months. During this period, the excess water delivered to Granite Reef Dam would be raised 88 feet by the McDowell pumping plant, and delivered by the McDowell pump canal to the proposed McDowell Reservoir for storage until required.

McDowell Reservoir would be created by the construction of a dam just below the confluence of the Salt and Verde Rivers. As previously described it would be used to impound water of the Colorado River delivered during the winter months when irrigation demands are light. Other uses would be the regulation of releases from upstream dams and the provision of flood control storage for the protection of downstream developments. A power plant would be installed to utilize the available head.

As a part of the central Arizona project, the existing Horseshoe Dam on the Verde River would be increased 40 feet in height, to provide a normal storage capacity of 298,000 acre-feet, in place of the 68,000 acre-feet now existing. A power plant installed at this dam would utilize Verde River water for energy production.

By an exchange of Colorado River water for Salt River water it would be possible to divert Salt River water from Sahuaro Lake behind Stewart Mountain Dam. The water thus diverted would flow by gravity through the potential Salt-Gila aqueduct to lands in the flood plain off the middle Gila and lower Santa Cruz Rivers. The aqueduct would have an over-all length of about 74 miles, most of which would be open concrete-lined canal, and would terminate in the existing Picacho Reservoir, south of Coolidge. Deliveries through this aqueduct would not only meet the supplemental water requirements of the area served, but would provide additional water as a basis for exchange which would permit increased diversions by upstream users.

The following three developments were investigated and reported on by the United States engineer office of Los Angeles, Calif., in their "Report on Survey—Flood Control—Gila River and tributaries above Salt River—December 1945." Data pertaining to these developments have been used with the consent and cooperation of that office. These developments have been incorporated in this project because they would serve a definite purpose in the over-all plan of development.

Construction of the Buttes Dam and power plant on the Gila River, approximately 62 miles below Coolidge Dam, would conserve a large part of the flood flows which enter the Gila River below Coolidge Dam. By utilizing the power head available at the Buttes site, energy would be provided for local irrigation pumping and commercial load. In addition, the Buttes Reservoir would provide control of floods for the protection of downstream lands. It would also impound silt which is contained in large quantities in the waters which are now diverted to the irrigated lands during the summer months, and which presents a serious problem to farmers of the area.

With water from the Salt River provided to lands in the middle Gila area as a basis for exchange, construction of a dam at the Charles-

ton site on the San Pedro River could be accomplished without infringement on the rights of downstream water users. This dam would be located about one-half mile north of Charleston, Ariz. It would provide flood control for the protection of downstream developments. In addition, it would regulate the erratic flows of the San Pedro River and facilitate diversions to land now irrigated along the river.

In addition, the Charleston Dam would serve as a diversion structure for the Tucson aqueduct. The Tucson aqueduct would consist of approximately 70 miles of closed conduit through which water would be conveyed to the city of Tucson. As a part of the aqueduct, a pumping plant would be installed to lift the water 300 feet for delivery to the aqueduct.

As a part of the central Arizona project, certain developments above San Carlos Reservoir would be required to meet the needs of the upstream irrigated areas. Numerous plans of development have been proposed for these upper lands. In general there appear to be four areas in need of additional development, namely, the Safford Valley, the Duncan-Virden Valley, the Red Rock Valley, and the Cliff Valley.

The principal function of the Safford Valley improvements would be to conserve and utilize the existing water supply to best advantage, and to consolidate the existing distribution system. A permanent diversion structure at the upper end of the Safford Valley to supply a high line canal would be included as a part of this development. This canal would extend along the south side of the valley, and a branch canal would cross the Gila River near Safford to serve the north side. Ground water in the area would be further developed to supplement the available surface water.

Construction of a dam at the Hooker site about 7 miles northeast of Cliff, N. Mex., is considered as a potential development to serve requirements of areas along the upper reaches of the Gila River. A dam at this site would provide partial flood control and silt retention for the benefit of downstream irrigators. It would also regulate the flood flows of the river, for use at a time when the normal flow of the river would be insufficient to meet irrigation requirements. Lands in the Cliff Valley, the Red Rock Valley, the Duncan-Virden Valley, and the Safford Valley, would all be benefited by this regulation.

Some of the districts included under the central Arizona project maintain their own distribution systems. However, many of those areas which are irrigated by pump water do not. In addition, some areas irrigated by surface water have inadequate distribution facilities. Under the central Arizona project, additions to the irrigation distribution system would be required for the delivery of water.

Despite water shortages throughout the major part of the central Arizona project, some of the lower-lying lands are faced with the problem of waterlogging. The central Arizona project would include a drainage system for salinity control. Open gravity drains would be used where possible. Other drainage, as required, would be accomplished by pumping from wells.

Under this project a power transmission system would be needed to convey power from Bridge Canyon power plant to the Havasu pumping plants, and from the various power plants throughout the project to the power market areas.

In discussing these various features, the primary purposes of each have been outlined. In addition to those enumerated, each of the features would have secondary purposes or provide incidental benefits which, considered in the aggregate, are of considerable importance. Possibly the most important of these is the recreational value of the various dams and reservoirs. Bridge Canyon Dam and Reservoir would afford a scenic attraction comparable to Hoover Dam and Lake Mead.

The importance of this may be more fully realized when it is recalled that 354,500 visitors were conducted through the powerhouse at Hoover Dam during 1946, 424,175 in 1947, and 407,980 in 1948. During this period more than 1,000,000 persons visited the Lake Mead recreational area each year. Thousands of visitors could enjoy the recreational facilities which would be provided by the Bridge Canyon Reservoir. In an arid country, such as that in which the central Arizona project is located, the importance of lakes for recreational uses is of far greater significance than commonly realized by residents of more humid climates.

Fish and wildlife propagation would be another important purpose served by each of the reservoirs to be created under the central Arizona project.

How the development would serve the needs: Water for irrigation and municipal requirements could be provided under the proposed plan of development. As previously outlined, the needs consist of replacement of the present overdraft on the ground-water basins, a supplemental supply for lands now in production, provision for drainage of excess salts out of the area to maintain a salt balance, increasing the water supply for the city of Tucson, and provision for the irrigation of land formerly irrigated but now idle for the lack of water.

As previously outlined in my testimony, it is estimated that 1,082,000 acre-feet of water could be made available under the proposed plan. Utilization of this water is outlined in the following table: New surface water at district headgates, 1,082,000 acre-feet. Supplemental water needed for lands now irrigated and to replace the necessary reduction in pumping and provide release for salt balance, 652,000 acre-feet. Required for municipal water supply, 12,000 acre-feet. Water remaining available for lands formerly irrigated but now idle for lack of water, 418,000 acre-feet.

In addition to providing 12,000 acre-feet of water for municipal requirements the project would provide supplemental water for 640,000 acres of the 672,000 acres irrigated at some time prior to 1945. Without the project 414,000 acres could be served an adequate water supply. This would indicate a loss of about one-third of the productive capacity of the irrigated area. Actually, the impending loss would be greater because continuation of the existing circumstances will result in less and less economical farming; those with substantial reserves will hang on, and one by one those individuals with the least reserves will be squeezed out until stability has been reached. That stable point will be one at which a bare profit can be made out of the irrigation enterprises—competition will keep it so.

The losses and distress to the individual enterprises during the adjustment period will be tremendous. The correlative interests—the loaning agencies, the local and State governments, and the Nation—

will suffer revenue and economic losses. Business houses will lose accounts, some will be forced out of business; mortgages will be foreclosed; farms will be taken over for taxes; and local, county, State, and Federal tax revenues will shrink.

Power development features of the project would contribute substantially to the increasing needs for electrical energy in the area. These features include one major power plant on the Colorado River at Bridge Canyon and small plants on the Salt, Verde, and Gila Rivers at McDowell, Horseshoe, and Buttes Dams, respectively. The potential Bridge Canyon power plan would be a logical step toward the ultimate development of the power resources of the lower Colorado River Basin. Under this development it has been assumed that provisions would be made for coordinated and integrated operation of all Government power plants on the lower Colorado River. These plants would be those at Bridge Canyon, Hoover, Davis, and Parker Dams. Coordinated operation would result in the production of greater amounts of firm energy and a more effective utilization of water than if the power plants were operated independently of each other.

The power market for the energy thus developed would consist of the State of Arizona, southern California, southern Utah, and southern Nevada. This area corresponds roughly to power supply areas 47 and 48 as designated by the Federal Power Commission.

Reservoir operation studies for power production have been made by the Bureau of Reclamation on the basis of full coordination and integration of the Government plants on the lower Colorado River. It has been assumed that Davis power plant would be completed and that the full designed capacity would be installed in Hoover power plant at the time that Bridge Canyon power plant was completed. In all studies, the amount of water available for power generation has been that incidental to river regulation, flood control, and irrigation releases and storage.

Coordinated operation of all power plants produces the largest possible amount of firm power. Under this system the plants with small reservoirs would generate a greater percentage of the total power produced during periods of high run-off, than they would in low run-off periods. Concurrently the plants with large reservoir capacity could reduce their output and store all possible water for use in low run-off periods. With this system of operation it is possible to produce a higher total system firm energy than under independent operation.

In the studies of reservoir operation for power, river flows for the years 1923 to 1942, inclusive, were used. These years represent a period of run-off for the Colorado River in which the average yearly flow is about 90 percent of the estimated long-time yearly average. The period 1931 to 1940, inclusive, is taken as a period of low flow of the river and is assumed as the critical period for the reservoir operation studies. These studies were computed for initial conditions of project development. Additional studies were made to determine the firm energy production under ultimate development.

Virgin stream flows were depleted for conditions estimated as representative of the above conditions of project development and were then used in the reservoir operation studies.

In order to present the studies of the various power plants under

different conditions of operation, and yet on comparable bases, certain fundamental concepts were adhered to in all studies. These concepts were (1) all reservoirs were full or at required flood-control levels at the start and finish of all reservoir operation studies; (2) irrigation demands governed the amount of water available for power; (2) under coordinated operation the firm-power production credited to Hoover power plant was equal to the amount which that plant could produce under independent operation; (4) minimum reservoir content of Lake Mead was held to the same level as would be experienced under independent operation; (5) all power plants under coordinated operation produced their average yearly credited amounts of firm power over the 10-year critical period; and (6) for comparative purposes Hoover and Bridge Canyon power plants were operated both independently and integrated in order to show the national benefits under coordinated operation.

The potential output of the Colorado River plants under the coordinated operation previously mentioned and at initial conditions is 10,725,000,000 kilowatt-hours of firm energy annually. Of this amount Bridge Canyon is credited with 4,675,000,000 kilowatt-hours, Hoover with 4,500,000,000 kilowatt-hours, and Davis and Parker with a combined total of 1,550,000,000 kilowatt-hours. The other power plants of the central Arizona project are credited with an annual production of 98,000,000 kilowatt-hours of firm energy annually.

The following table shows the generation of central Arizona project for the three stages of development studies.

For each of the potential power plants the table shows the installed capacity, the average gross power head feet, and the annual firm energy in million kilowatt-hours under initial conditions, average conditions, and ultimate conditions.

The chart shows the Stewart Mountain replacements, and the power required between Havasu and McDowell pumping plants is shown, with each condition, and the net energy production available for the commercial market.

(The document is as follows:)

Summary of power plants

Power plants	Installed capacity	Average gross power head feet	Annual firm energy in million kilowatt-hours		
			Initial conditions	Average conditions	Ultimate conditions
Bridge Canyon	750,000	612	4,675	4,395	4,114
McDowell	4,100	54	23	21	19
Horseshoe	10,000	141	40	40	40
Buttes	6,000	144	35	35	35
Total	770,100		4,773	4,491	4,208
Stewart Mountain replacements			25	28	31
Total			4,748	4,463	4,177
Pumping requirements, Havasu and McDowell			1,154	1,393	1,633
Net energy production			3,594	3,070	2,544

Mr. LARSON. Other needs of the area would be served by multiple-purpose features of the project through incidental benefits, such as

flood control, silt retention, salinity control, recreation, and fish and wildlife propagation. Although these benefits are considered incidental to the primary purpose of the project, they are significant.

Economic feasibility of the project: The last major element to be considered in the investigation of a project is economic feasibility. Will the project pay out? Will the returns equal the cost? Do the benefits exceed the cost?

Estimated construction costs are presented in table A–5, entitled "Summary of costs." Annual costs are presented in table B–5, entitled "Summary of annual costs." Cost estimates by the Bureau of Reclamation were completed on the basis of construction cost-levels prevailing in July 1947. Estimates and costs for Buttes and Charleston Dams, Tucson aqueduct, and Safford Valley improvements were prepared by the United States engineer office, Los Angeles, Calif. These estimates were based on prices prevailing in 1939 and were adjusted by the Bureau of Reclamation to reflect construction-cost levels prevailing in July 1947. All costs include allowances for engineering and contingencies.

It will be recognized that the Bureau's report had anticipated somewhat different provisions as to repayment requirements than are presented in the bill under consideration by this committee. The discussions which follow reflect the provisions of the bill now under consideration. Tables A–5 and B–5 show the allocation of construction costs and annual costs, respectively, that have been made to the several items for which allocable costs would be authorized in the bill. Incidentally copies of those tables are also attached to this report. The studies allocate construction and annual costs to irrigation, power, municipal water supply, flood control, silt control, recreation, fish and wildlife conservation and propagation, and salinity control. The first three items are considered reimbursable, the last five are considered nonreimbursable. Costs allocated to irrigation and municipal water supply are considered repayable without interest. The construction costs allocated to power are considered as interest-bearing. An interest rate of 3 percent has been applied and the interest component has been used to assist in repayment of the irrigation obligation which is beyond the ability of the water users to repay.

Annual costs of the project shown on table B–5 include operation and maintenance and replacement reserve. Other annual costs include the annual payments on the reimbursable portion of the construction cost.

Allocation of construction costs to the various functions were computed by two methods—the alternate justifiable expenditure method and the proportionate use method. The method chosen for use on any one feature was that which was most suitable.

Direct returns would accrue to the project from the sale of irrigation water, municipal water, and electric energy. The estimated average annual returns from these items would be (1) from irrigation water, $3,147,900; (2) from municipal water $527,900; (3) from power, $12,635,000. These returns are sufficient to repay the full reimbursable project construction cost, annual operation and maintenance expenses, and establish the necessary replacement reserve.

A charge to the farmer of $3.30 an acre-foot at the district headgates which corresponds to a charge of $4.75 at the farm headgate

91190—49—ser. 11, pt. 1——27

was used as the basis for computing annual returns from the sale of irrigation water. This price is predicated upon repayment ability studies made of the project area, based on 1939 to 1944 average values of crops at the farm.

A study of municipal water rates in various cities in the West indicates that the city of Tucson could pay for its municipal water at the rate of $0.15 per 1,000 gallons at the intake of its distribution system.

The rate at which electrical energy would be sold was determined on the basis of providing revenues adequate to assure full payment of all reimbursable costs after the revenues from irrigation and municipal water had been credited to the account. The rate determined is 4.65 mills per kilowatt-hour at the load centers.

As outlined above the project would pay out; and the returns would equal the costs in accordance with the repayment provisions of the bill under consideration.

Benefits accrue not only to direct beneficiaries, such as the initial purchasers of irrigation water, municipal water, and electrical energy, but there are innumerable indirect beneficiaries whose income and livelihood are dependend upon or substantially affected by the creation of raw materials on the irrigated lands and the production of electric energy. Nor are the benefits limited to those arising out of irrigation and municipal water, and out of the use of electrical energy. The central Arizona project would be a multiple-purpose development which would also furnish public benefits from flood control, silt control, fish and wildlife conservation, salinity control, and recreation. The following analysis compares total or national benefits with total or national costs.

Benefits from the project have been divided into two categories. The first comprises those tangible benefits upon which monetary values have been placed. The second includes intangible benefits, which cannot be evaluated in monetary terms, and a few tangible benefits not evaluated.

Tangible benefits from irrigation are estimated to have an average annual value of $25,268,000. In arriving at this estimate two general types of tangible irrigation benefits from the project have been evaluated. The first is composed of benefits accruing directly to farmers and indirectly to others from the production of a larger volume of agricultural products than would be produced without additional irrigation water. The second is comprised of benefits accruing directly to farmers from the reduced pump lift that would result from elimination of the overdraft of ground water.

The sum of tangible benefits accruing to direct and indirect beneficiaries that would result from the production of additional farm products will average $23,579,000 annually. These benefits are calculated as the increase in the gross value of crops at the farm, based on a price level equivalent to that occurring during the years 1939 to 1944 which is substantially less than occurred during the past few years. The benefits from savings in the cost of pumping irrigation water will average $1,689,000 annually, which represents the difference between the deteriorated conditions that will occur if supplemental water is not forthcoming, and the improved conditions that would accompany the furnishing of additional water.

The $25,268,000 of annual irrigation benefits is considered as a

measure of the net effects of producing, processing, and handling in commercial channels the greater volume of agricultural products emanating from the project area. It is, therefore, assumed to represent the net benefits from irrigation. These include such benefits as the stimulation of business activities associated directly and indirectly with this larger volume of production. As an example, the farmers grow more lettuce; the truckers, packers, and railways handle more lettuce; and the business activity of restaurants, retail stores, personal services, and many others improves. All make greater net returns because of the greater volume of lettuce. The converse will occur with a decreased volume of agricultural products. Maintenance and even expansion of public facilities without increasing State and local tax rates would be possible with increased supplemental water, in contrast to the prospective retrenchment that would accompany the reduced agricultural production without it. All benefits of this type are included in the irrigation benefits which are used in the benefit-cost ratio.

Power benefits resulting from consummation of the central Arizona project would pyramid into a volume far above the sale value of the actual energy produced. A monetary value of benefits has not been determined but, in lieu thereof, the computed sales value of the power has been used as a conservative estimate of the minimum benefit. Average annual power benefits are, therefore, assumed as being measured by the sale of electrical energy at a unit price of 4.65 mills per kilowatt-hour. The annual return would aggregate $12,635,000. In computing these returns, the accumulative effect of upstream depletions resulting in a corresponding gradual reduction in power output, has been reflected.

Municipal water supply benefits, like those of power, are so widely distributed that they cannot be fully evaluated. In lieu of a more accurate determination they have been considered as being equal to the estimated revenue derived from the sale of water. Such consideration reflects utmost conservatism. Municipal water supply returns are computed at $528,000 annually. This amount was derived from the application of a unit sales price of $0.15 per 1,000 gallons to 10,800 acre-feet of water delivered annually to the municipal distribution system of Tucson.

Silt control benefits are estimated to have an annual value of $1,350,000 during the project repayment period. This total includes the value of protecting the Boulder Canyon project, the value of this protection being based on the replacement cost of a proportionate part of Lake Mead storage. It also includes the benefits associated with Buttes and Hooker Reservoirs. These benefits from the latter two reservoirs were derived from data furnished by the United States engineer office, Los Angeles, Calif.

Recreation benefits have been estimated by the National Park Service on the basis of travel value per car, the recreational value per visitor, periodic value of visitors, and a general value which represents a gross profit to local business. The annual benefit is estimated at $1,482,000 annually.

Fish and wildlife benefits of $145,000 have been estimated by the Fish and Wildlife Service. This net annual benefit represents the minimum that may be expected from operation of the project as

presently contemplated. The estimated annual value covers fish, large and small game, fur-bearing animals, and waterfowl.

Flood-control benefits are computed at $316,000 annually. Five of the features included in the central Arizona project would provide flood control. Such benefits at Buttes, Charleston, and Hooker Dams, and the Safford Valley improvements were evaluated by the United States engineer office on the basis of 1939 levels. The benefits determined by that office were subsequently adjusted by the Bureau of Reclamation to reflect the higher price levels that, it is believed, will occur during the repayment period. Flood-control benefits at McDowell Dam were determined on the basis of preliminary studies made by the Bureau of Reclamation.

Benefits accruing because of the salinity control provided by the project drainage system have been estimated to amount to $256,000 annually. This benefit results from the use of the drainage system for the release of water from the project area which contains accumulations of various salts in harmful quantities.

In evaluating annual costs for determining a benefit-cost ratio, all construction costs are assumed to be amortized with interest as a measure of the actual national cost, regardless of the legal aspects of reimbursability or interest-free allocations. Annual amortization costs have been computed on the basis of retiring all project construction costs over a 70-year period at an assumed national interest charge of 2 percent on the unpaid balance of the debt. This annual charge has been computed to be $19,691,600.

Operation and maintenance costs have been estimated for each of the various features included in the potential project development. The total of these costs would average $4,551,200 annually during the repayment period.

Reserve for replacement is provided in accordance with the estimated requirements for the various features of the project development. It is estimated that payments totaling $2,212,400 annually would be required to provide the necessary reserve.

The relationship between project benefits and costs is outlined in the following table:

COMPARISON OF BENEFITS AND COSTS

Average annual benefits: irrigation, $25,268,000; power, $12,635,000; silt control, $1,350,000; recreation, $1,482,000; municipal water supply, $528,000; flood control, $316,000; fish and wildlife conservation, $145,000; salinity control $256,000; total, $41,980,000.

Average annual costs: operation and maintenance, $4,551,200; reserve for replacement, $2,212,400; amortization of all project construction costs at 2 percent, $19,691,600; total, $26,455,200. Ratio of annual benefits to annual costs equal 1.59 to 1.

Intangible benefits of the project are many but are of such complexity that they have not been evaluated in monetary terms.

The serious consequences that would result from a retrenchment in the economy of the area, including a probable enforced migration of many rural and urban families would be averted. Instead, much additional employment would result, both during construction and as a result of operating the project and project lands. The increased production of electric energy would encourage industrial expansion

far beyond the borders of the project and even beyond the boundaries of Arizona. Increased productive capacity and the wider use of electric energy for domestic use would improve living standards. Such benefits and many similar ones add to the desirability of the development.

Summary: On the basis of the investigations completed on the central Arizona project by the Bureau of Reclamation, the analysis of the four fundamental elements can be summarized as follows:

(*a*) There is a definite need for supplemental water for irrigation of lands now under cultivation within the project area. All of the potential supply of water is needed by lands that have been farmed. Unless supplemental water is made available approximately one-third of the productive capacity of the agricultural development will be lost resulting in a serious economic problem to the State of Arizona. The city of Tucson is in need of a supplemental supply of water to meet the growing requirements. There is a critical power shortage in the southwest area at the present time. Unless hydro-power potentialities are utilized, requirements must be met by expanding steam developments which will result in further consumption of limited irreplaceable natural resources. All of the potential power output of the project could be utilized immediately.

(*b*) Practically all of the potential water supply for the project must come from the Colorado River. Compacts, and contracts have been entered into by the States and the United States. There is a wide difference in the interpretation of these documents by officials of the States of Arizona and California. The project water supply from the Colorado River is dependent on the validity of the interpretations by officials of Arizona.

(*c*) The potential development, as outlined, would serve the needs of the area to the full extent of Arizona's asserted entitlement. The supplemental irrigation water made available in Arizona would prevent a one-third loss of the productive capacity of the farm land that has been in cultivation. Domestic water supplies would be improved. The hydro power that could be made available would result in a saving of about 6,000,000 barrels of oil annually. Many other needs would be served or supplemented by the potential development.

(*d*) Under provisions of the bill now under consideration the project would pay out. The benefits exceed the costs by a ratio of more than 1.59. Experience and history have proven that the strengthening of a weak unit of our national economy adds to the strength of the whole, both in normal times and in emergencies; the central Arizona project has been designed for such purpose.

Mr. MURDOCK. Thank you, Mr. Larson. This thought runs through my mind, though it is not a question but just a statement of fact: In our Public Lands Committee many times we have to do with arid countries in the West for grazing purposes, and I have pointed out frequently that the possession of a water hole by stockmen, although it may be only a small water hole, controls a vast surrounding area, and makes the total area profitable. Somehow the matter comes to mind as I have listened to the discussion. I mean a comparatively small amount of water will firm up the economy of a whole large State. Because Utah and New Mexico are interested and Governor Miles is here, I think we ought to call on him for any questions, comments, or statements he may have.

Mr. MILES. I do not believe I have any at this time.

Mr. MURDOCK. We want to adjourn to go to a meeting of the full committee in a few minutes. You will be available tomorrow, I presume, Mr. Larson?

Mr. LARSON. Yes, sir.

Mr. ENGLE. Mr. Chairman, I have some questions to ask. I wonder if I could initiate the questioning.

Mr. MURDOCK. Yes, go ahead, Mr. Engle. Let us confine this session to about 10 minutes as a starter.

Mr. ENGLE. Mr. Larson, I want to direct your attention to page 8 of your statement. The second sentence on page 8 says:

> The Colorado River compact apportioned waters of the Colorado River between the upper and lower basins, designating "Lee Ferry," on the Colorado River, 1 mile below the mouth of the Paria River, as the point of division. The apportionment of Colorado River waters by the Colorado River compact is from the virgin or undepleted flow of the stream, that is, from the stream as would be in the absence of any development.

Now, I have before me a copy of the Colorado River compact. That is section III (a).

I am reading from article II (a) of the Colorado River compact which says:

> The term "Colorado River system" means that portion of the Colorado River and its tributaries within the United States of America.

Article III (a) reads as follows:

> There is hereby apportioned from the Colorado River System in perpetuity to the upper basin and to the lower basin respectively the exclusive beneficial consumptive use of 7,500,000 acre-feet of water per annum which shall include all water necessary for the supply of any rights which may now exist.

I want to ask you how you reconcile that quotation from the Colorado River compact with your statement that the "Colorado River compact apportions the waters of the Colorado River."

Mr. LARSON. As I see it, it would be apportioned from the virgin flow, but the apportioned water would include any existing uses.

Mr. ENGLE. Can you show me anywhere in this compact where it uses the word "virgin"? I do not believe it is there, Mr. Larson, and I bring up the point to emphasize the proposition that for a proper understanding of the differences of opinion it is essential for the committee to understand that the Colorado River compact does not divide waters of the Colorado River but allocates the beneficial consumptive use of water of the Colorado River system in the upper and lower basins.

Now I assume, Mr. Larson, that the statement which you have made here is predicated to some extent at least—inevitably it must be—upon the contentions of Arizona. I believe you say that. That is, if Arizona's contentions are not correct there is no water for this project, is that right?

Mr. LARSON. That is right. That is the way the report is set up.

Mr. ENGLE. In other words as Mr. Straus said on January 26, 1948, and I am reading from his statement:

> If the contentions of California are correct there will be no dependable water supply available from the Colorado River for this diversion.

Now, in order to point the matter up a little more specifically, I would like to have you refer to page 11 of your statement. On page 11

of your statement, in the next to the last paragraph, on the basis of these assumptions, which are the assumptions of Arizona, you have indicated what Arizona's share of the Colorado River would be, and I am quoting from your statement:

Water from article III (a) and III (b), 3,800,000 acre-feet.

Since that includes the III (b) water I assume that it includes all the III (b) water which would be 1,000,000 acre-feet. Is that correct?

Mr. LARSON. That is correct.

Mr. ENGLE. But if California's contention is correct there would be deducted from that one-half million acre-feet or 500,000 acre-feet?

Mr. LARSON. That is right.

Mr. ENGLE. That is correct.

Now, going over to page 13 of your statement, in the middle of the page, you indicate the present depletions, and give the Gila River Basin depletion at 1,135,000 acre-feet. However, on California's theory of beneficial consumptive use that should be 2,300,000 acre-feet?

Mr. LARSON. My understanding is California's contention is that Arizona should be charged for the amount of water they are using on the Gila River for beneficial consumptive use.

Mr. ENGLE. That is correct, and in that instance, then, you would have to add to the Gila River Basin depletion 1,000,000 acre-feet of water, is that not right?

Mr. LARSON. Not under the term "depletions."

Mr. ENGLE. What do you mean by that?

Mr. LARSON. As I stated. In other words, the depletions of the Gila River, speaking of the flow at the mouth, are given. Throughout our statement we refer to depletions at Lee Ferry and at the Mexican boundary.

Mr. ENGLE. I know what you mean. It is perfectly correct that if you adopt Arizona's theory of depletions the depletion is 1,135,000 acre-feet. That is what you are saying, is it not?

Mr. LARSON. That is the amount that Arizona's use of water would deplete the flow of the Gila River at the mouth.

Mr. ENGLE. On the contrary, if you accept California's theory and charge Arizona with the beneficial consumptive use in the Gila River Basin, then that beneficial consumptive use would be 2,300,000 acre-feet approximately, is that correct?

Mr. LARSON. It would be something less than that. It would be whatever the virgin flow was, less the amount of water now flowing out of that area.

Mr. ENGLE. You used the words "virgin flow" again. That is a matter of interpretation, also, is it not, inasmuch as the word "virgin" itself does not appear in the compact? I do not want to argue about the particular amount of water. The point I want to bring out is that if California's theory is correct these figures have to be reshuffled.

Mr. LARSON. That is correct. They would have to be readjusted.

Mr. ENGLE. In addition to that, there is one other item. That is the matter of the main stream reservoir losses which are set here at 313,000 acre-feet. Now, if California is correct that the 4,400,000 acre-feet allowed California under its limitation act is net for use in California, then California would not be chargeable with evaporation losses on the Lake Mead Reservoir; is that correct?

Mr. LARSON. That is correct under California's interpretation.

Mr. ENGLE. That would give California that much more water. Under those circumstances there would be, as Mr. Straus says, no available water supply for this project, or no available firm water supply; I will put it that way; is that correct?

Mr. LARSON. That is right. In other words, that was brought out in the statment, I think.

Mr. ENGLE. I believe it was, but I just wanted to emphasize it.

Now, I return to page 2 of your statement, and I read here in the last sentence of the next to the last paragraph:

A like sum—

referring to $200,000—

for the same purpose was allocated by the Bureau, from its investigation funds, and a formal agreement on procedure was executed July 31, 1944.

Why would the Bureau of Reclamation spend $200,000 of the taxpayers' money investigating a project for which there was no firm water supply?

Mr. LARSON. In investigating projects it has always been the policy of the Bureau of Reclamation to match our funds with contributed money.

Mr. ENGLE. Well, I agree with that, but is it not true that if this case goes finally to the Supreme Court and is adjudicated—I think that is the only way it can be adjudicated—and it develops that Arizona is not correct in its contentions, all of them, then the $200,000 you have spent or presumably will have spent on these investigations will have been wasted?

Mr. LARSON. Well, that may be true in many other cases. For example, until a project is investigated very little is known with regard to its feasibility, water supply or anything else. That is the purpose of the investigation.

Mr. ENGLE. The purpose of your investigation, Mr. Larson, is not to determine the correctness of California's contentions. As a matter of fact, in your own statement here you have emphasized the proposition, and I am reading from page 10:

This presentation is not intended to be prejudicial to the claims of the States challenging Arizona's interpretations. The Bureau of Reclamation recognizes these differences of opinion, but, as has been stated in our report, the Bureau cannot authoritatively resolve those differences.

The point I am making is, and it may not be particularly important, why in the world would the Bureau of Reclamation spend $200,000 of the taxpayers' money investigating the economic and engineering feasibility of a project without first knowing something about the solution of these problems which it admits exists. If they are determined adversely to Arizona then $200,000 is wasted, is it not?

Mr. LARSON. Well, Congressman, the same thing would apply to developments in California. Why investigate land classification on the east and west mesa, for example? That would be money thrown away on the same basis.

Mr. ENGLE. I think there is a very clear difference, Mr. Larson, between investigating economic and engineering feasibility of a project and launching upon an investigation costing $200,000 of the taxpayers' money when it is well known that there are legal questions

involving the source of water. That is like doing the engineering on construction of a building before you have title to the lot.

Mr. MURDOCK. Would my colleague yield for a question?

Mr. ENGLE. Yes.

Mr. MURDOCK. We have a general investigation fund on the part of the Bureau of Reclamation. It is included each year in the appropriation bill for the Department of the Interior. One item in it amounts to $500,000, to carry on investigations in the Colorado River Basin. Since the whole basin of the Colorado River is in question in your mind, have we not been wasting $500,000 annually in that appropriation? More than 100 projects in the Colorado River Basin have been listed.

Mr. ENGLE. Well, I think, Mr. Murdock, that it is apparent that some projects sometime or other are going to be adopted. This is a specific allocation of $200,000 to the study of the economic and engineering feasibility of a project predicated upon assumptions of a legal title which are not known to exist. It would seem to me to have been much more logical to determine the legal questions involved in this matter and then spend the money. If you wasted it then it would be because of the engineering and economic feasibility, which did not work out, but not because there was a basic legal question which was not solved beforehand.

Mr. POULSON. Will my colleague yield?

Mr. ENGLE. Yes.

Mr. POULSON. That is further summarized in your statement on page 37, in article (b) where it says:

> Practically all of the potential water supply for the project must come from the Colorado River. Compacts, and contracts have been entered into by the States and the United States. There is a wide difference in the interpretation of these documents by officials of the States of Arizona and California.

Here he summarizes the crux of the whole matter, as you brought out:

> The project water supply from the Colorado River is dependent on the validity of the interpretations by officials of Arizona.

It is not the officials of any other State, but "officials of Arizona." That summarizes the crux of the whole matter, as you brought out.

Mr. ENGLE. Mr. Chairman, I know our time is up. I have some questions I want to ask about the economic feasibility of this project which will take some time. I assume Mr. Larson will be available tomorrow?

Mr. LARSON. That is right.

Mr. MURDOCK. He will be available tomorrow at 10 o'clock.

In view of the fact that the full committee is meeting for a few minutes just before 12 o'clock, the subcommittee will stand adjourned until 10 o'clock tomorrow morning.

(Thereupon, at 11:42 a. m., Wednesday, April 27, 1949, an adjournment was taken until 10 a. m., Thursday, April 28, 1949.)

THE CENTRAL ARIZONA PROJECT

THURSDAY, APRIL 28, 1949

HOUSE OF REPRESENTATIVES,
SUBCOMMITTEE ON IRRIGATION AND RECLAMATION
OF THE COMMITTEE ON PUBLIC LANDS,
Washington, D. C.

The subcommittee met, pursuant to adjournment, at 10 a. m., in the anteroom of the committee room of the House Committee on Public Lands, New House Office Building, the Honorable John R. Murdock (chairman of the subcommittee), presiding.

Mr. MURDOCK. The subcommittee will please come to order.

We will continue our hearings this morning on H. R. 934. At our session yesterday in a small committee room we were unable to have a full attendance. I hope that we may be favored with a larger attendance from now on.

At our session yesterday we heard from Mr. Larson, a representative of the Bureau of Reclamation. I do not know that I told him so, but I think this is a good presentation. It appealed to me, as sponsor of the bill, because it shows the comprehensive plan that is involved here and the far-reaching effects. The Bureau of Reclamation has evidently looked into this matter from top to bottom and has gone clear out to the twig ends of the matter to show its effect not only upon the entire State of Arizona, but upon the neighboring States of Utah and New Mexico, also.

Mr. Larson had just completed his statement about 10 minutes before we adjourned, and we had taken up the matter of questioning. Mr. Engle had the floor on the matter of questioning.

Mr. Larson is with us.

May I ask: Was there any other member of the Department to give us further information on this? Were you, Mr. Nielsen?

Mr. NIELSEN. No.

STATEMENT OF V. E. LARSON, ASSISTANT REGIONAL PLANNING ENGINEER, REGION III, BUREAU OF RECLAMATION, DEPARTMENT OF THE INTERIOR—Resumed

Mr. ENGLE. Mr. Chairman, yesterday I indicated I wanted to ask Mr. Larson some questions relating to the showing of financial feasibility of this project.

Mr. Larson, I have before me the letter from the Bureau of the Budget of February 4, 1949, in which Mr. Pace says that this project is not in accord with the program of the President. Have you seen that letter?

Mr. LARSON. Yes; I have.

Mr. ENGLE. I am reading from the fourth paragraph on the first page, in which Mr. Pace says, and I quote:

> It is the opinion of the regional director of the Bureau of Reclamation that the "project has engineering feasibility in the sense that there are no physical obstacles * * * that could not be overcome."

Now, that phrase intrigued me a little. Does that mean that the project is engineeringly feasible if you are willing to spend enough money to overcome the physical obstacles? Is that correct?

Mr. LARSON. The project can be built from an engineering standpoint. There is nothing we have found that could not be overcome. On the basis of our analyses the project would pay out and sell power at a very attractive rate.

Mr. ENGLE. Well, I was wondering why the regional director of the Bureau of Reclamation, whom I assume to be the man in charge of the region in which this project is located, should qualify the engineering feasibility to such engineering feasibility in the sense that there are no physical obstacles that could not be overcome. That seemed rather odd language to me. Is that the usual language in reporting on a project of this sort?

Mr. LARSON. That is often included in the language.

Mr. ENGLE. The regional director, as quoted by the Bureau of the Budget, further states, and I am reading from page 2:

> Financial feasibility of the project is more difficult to determine.

Did you recognize any difficulty in determining financial feasibility?

Mr. LARSON. Well, as I said on the basis of our analyses the project would pay out, by selling power at a rate of 4.65 mills per kilowatt-hour delivered at the load center.

Mr. ENGLE. You and the regional director of the Bureau then are not in disagreement; is that correct?

Mr. LARSON. That is correct.

Mr. ENGLE. You do then concede that it has been difficult to determine financial feasibility, but it can be done; is that right?

Mr. LARSON. No; I do not recognize that it is difficult to determine the financial feasibility. I maintain that financial feasibility has been determined and shown in the report, as well as in the statement that I presented yesterday.

Mr. ENGLE. How do you reconcile that with the regional director's statement that "financial feasibility of the project is more difficult to determine"?

Mr. WELCH. Who is the regional director, may I ask?

Mr. ENGLE. What is his name?

Mr. LARSON. Mr. E. A. Moritz.

Mr. WELCH. Where is he located? Where is his headquarters?

Mr. LARSON. Boulder City, Nev.

Mr. ENGLE. How do you reconcile your clear statement, your unequivocal statement with regard to financial feasibility, with the statement made by the regional director that determining economic feasibility has been difficult, if you can?

Mr. LARSON. Well, it is true that it is an expensive project; on the basis of selling the irrigation water at $4.75 an acre-foot delivered to the farm head gate, and municipal water at 15 cents per 1,000 gallons, and power at 4.65 mills per kilowatt-hour delivered at the load center the reimbursable costs would be returned to the Federal Treasury.

Mr. ENGLE. This report goes on to say, referring to the report of the Bureau of Reclamation:

It is pointed out in the report that the project as proposed is economically infeasible under existing reclamation laws.

You have had to change the reclamation laws, have you not, or to expand the present reclamation laws to make this a feasible project; is that not true?

Mr. LARSON. Only in this sense: That all costs would be repaid within a 50-year period.

Mr. ENGLE. You do not mean——

Mr. LARSON. Excuse me. Or, if power could be sold for 6.22 mills at the load center the project would be feasible under the reclamation law.

Mr. ENGLE. Well, now, you have in fact, though, extended the repayment period in this project to 70 or 78 years; is that not true?

Mr. LARSON. Seventy years.

Mr. ENGLE. The report by the Bureau of Reclamation sets this project up on a 78-year basis, does it not?

Mr. LARSON. Well, the report set it up on a 78-year basis, and one reason for the 78 years is that at the time we were working on the report the Rockwell bill was under consideration and had been considered for some time. In that bill a 78-year repayment period was set up. That is the reason for that odd number of years.

Mr. ENGLE. But in addition to being required to change the existing reclamation laws with respect to the period of time for a project to pay out, if you will refer to page 36 of the statement, I believe you have included an addition in the annual benefits which are nonreimbursable in the current law; is that not correct?

Mr. LARSON. That is correct, but instead of selling power at 6.22 mills power could be sold at 4.65 mills under the provisions of the bill that is now under consideration.

Mr. ENGLE. Is that a competitive rate?

Mr. LARSON. 4.65?

Mr. ENGLE. No; 6.22.

Mr. LARSON. Well, I believe it probably could be sold unless there is some change in costs as they are at the present time. An analysis of the costs of power in the Los Angeles area, based upon studies completed by the Bureau of Reclamation, run as follows: If oil costs $2.25 a barrel, the power would cost 8.74 mills per kilowatt-hour assuming 5 percent interest on the bonds; at 4-percent interest the cost would be 8.52; at 3 percent on the investment it would be 8.29; and at 2 percent on your bonds it would be 8.1.

Mr. ENGLE. What I am trying to get at, Mr. Larson, is the particulars in which existing reclamation law will have to be changed to make this project economically feasible, because I assume that the statement made in the budget report that this project is economically infeasible under existing reclamation law is correct.

We have agreed that the repayment period is extended. On page 36 of your statement you put in recreation, silt control, and salinity control as additional nonreimbursable features, do you not?

Mr. LARSON. That is correct, but in the Bureau of the Budget statement that is based upon the opinion that power could not be marketed at 6.22 mills.

Mr. ENGLE. In other words, you put in the additional nonreimbursables because of the statement that the power could not be sold at the higher price; is that correct?

Mr. LARSON. No; we put in the nonreimbursable provisions in accordance with the bill we were requested to report on.

Mr. ENGLE. In other words, this bill does change the existing reclamation law to add certain nonreimbursable features?

Mr. LARSON. That is correct.

Mr. ENGLE. The addition of these nonreimbursable features plus the extension of time are the changes which are made in existing reclamation law in order to make this project feasible under your report; is that correct?

Mr. LARSON. It would have to be qualified to this extent: Power could not be sold at 6.22 mills. If power could be sold at 6.22 mills the project would be feasible under the existing reclamation law.

Mr. ENGLE. Can you do it?

Mr. LARSON. Well, I just read you the costs.

Mr. ENGLE. Then why did you not do it?

Mr. LARSON. That is a possibility.

Mr. ENGLE. But you have not figured it on that basis?

Mr. LARSON. We have figured it on several bases. We figured it on the basis of the reclamation law, on the Rockwell bill that was being considered.

Mr. ENGLE. That is not the law, of course.

Mr. LARSON. That is right, but there are several possibilities. The answers to all of these possibilities, of course, are contained in the report.

Mr. ENGLE. Well, I want to deal with that report in a few minutes; but, without taking too much time, we can agree—can we not?—that this statement of yours is predicated upon two changes in existing law: an extension of time plus the addition of these nonreimbursables which are not now in the law, mentioned on page 36. Is that right?

Mr. LARSON. This statement I presented yesterday is based upon the provisions of the bill you are now considering.

Mr. ENGLE. Referring your attention again to this Bureau of the Budget report to which I have previously alluded, I notice that on page 3, quoting from the first paragraph, it is stated:

> The comments of the several affected State governments and interested Federal agencies with respect to his report contain a number of objections and reservations with respect to the proposed project. Specifically, the Department of Agriculture questions whether the benefits actually exceed the costs.

Your statement indicates you have given a cost-benefit ratio of 1 to 1.59. Is that correct?

Mr. LARSON. That is correct.

Mr. ENGLE. You have then found that you do have a favorable cost-to-benefit ratio; but the Secretary of Agriculture, in his comment upon the report which was filed, says that he doubts that.

> It questions, as it has on numerous other occasions in commenting on proposed reclamation projects, the use of the gross- rather than the net-crop-return method of computing benefits.

Have you used the gross crop returns?

Mr. LARSON. We have used the gross crop returns as a measure of the irrigation benefits.

Mr. ENGLE. How do you justify that?

Mr. LARSON. That is a method that we have used for several years. We have made attempts to improve that method, and at the present time or at the time we worked on this particular project we did not have a method available that would reflect all the benefits from irrigation as does the gross crop income.

Mr. ENGLE. For instance, referring to page 32 of your statement, I observe that you have credited as tangible benefits from irrigation an annual value of $25,268,000. You say:

> Tangible benefits from irrigation are estimated to have an average annual value of $25,268,000.

That means, according to my thinking, that you have taken the gross agricultural revenues and found them to be $25,268,000. Is that correct?

Mr. LARSON. $23,579,000. The $1,689,000 is from the reduced pumping.

Mr. ENGLE. Yes. I want to comment on that in a minute.

Mr. LARSON. Yes.

Mr. ENGLE. Last year, for instance, I had a plum grower out in my district who had a plum crop which grossed about $80,000, but he took $10,000 of red ink on his books in producing the crop and selling it. Under those circumstances, if you had that occur in a crop in Arizona under this project, would you nevertheless credit that $80,000 to the benefits?

Mr. LARSON. Well, gross crop income is a basis of measuring of benefits from the production of these crops. For example, by producing lettuce, you furnish labor to the fellows planting and harvesting the lettuce. When the lettuce is harvested, it goes to the packing shed and again furnishes labor. This lettuce must be iced, which furnishes labor to men working in an ice plant. Then the lettuce is shipped to the markets. It again furnishes labor to men working on the railroads, and revenues to the railroads.

We have recently worked with a revised method to measure all these benefits, and on some of the projects where that method has been applied it shows that the national benefits exceed the gross crop income for the average crops grown.

Mr. ENGLE. Well, I am a little puzzled how you can take the gross crop without counting the cost of production, and say that that is the benefit to irrigation.

Now, I notice that the Deparment of Agriculture, in its comment of May 5, 1948, says, and I am quoting:

> In the estimation of benefits, gross rather than net crop values have been used in the calculation of irrigation benefits.

Then they go on to say:

> In the present report it is indicated that this cost of production is assumed to equal the indirect benefits accruing to the project, but in our opinion this is not a valid way of estimating indirect benefits.

In other words, the Department of Agriculture objects both to the method of determining direct benefits in your report and to the method of determining indirect benefits.

As I understand it, you take the gross revenues which you anticipate

will occur, which, of course, is based on certain assumptions, and then you double that and say that is the direct and indirect benefits.

Mr. LARSON. Not double it. Take the gross crop income.

Mr. ENGLE. How do you get the indirect benefits?

Mr. LARSON. We have not measured the indirect benefits. That is the intangible indirect benefits. We have assumed that the indirect benefits to the Nation are equal to the gross crop income.

Mr. ENGLE. That is just exactly what I said; is that not right?

Mr. LARSON. That is right, but I understood you to say that you take the gross crop income and then double it as a measure of these benefits.

Mr. ENGLE. Both direct and indirect from irrigation.

Mr. LARSON. No. For example, in expressing the benefit from irrigation as $23,579,000, that is equal to the gross crop income.

Mr. ENGLE. That is right.

Mr. LARSON. Not doubled.

Mr. ENGLE. But that is the direct benefit.

Mr. LARSON. That is the indirect benefit.

Mr. ENGLE. The Department of Agriculture says you ought to take the net rather than the gross. Is that not right?

Mr. LARSON. If you take the net profit, you might say, from crop production, then you could not stop there because there are other benefits beyond that. In producing this raw material, there are many direct and indirect benefits to the Nation beyond the net benefits to the farmer.

Mr. ENGLE. I know, but they are highly intangible. In other words, we might go down here to Baltimore and have the Government set up a shoe factory. You could claim that the gross income to the shoe factory was a benefit to the Nation, just the same as you could go down to Arizona and build a $738,000,000 project and claim that that creates a benefit to the Nation.

Let me ask you this question: If you did not use the gross returns on agricultural production, would this project be feasible?

Mr. LARSON. How would you express feasibility then? On the basis of paying out?

Mr. ENGLE. You mean you could make a cost-to-benefit ratio of 1.59 without using this $23,579,000 figure for irrigation benefits?

Mr. LARSON. The total reimbursable costs to be returned to the Government could be realized.

Mr. ENGLE. How would you justify it if you did not use that kind of return? If you used a net return rather than a gross return, would that not make your project economically infeasible?

Mr. LARSON. What would be the measure of feasibility? If the project would pay out, would it be feasible? Is that what you have in mind?

Mr. ENGLE. I am trying to determine what would happen if you used a net rather than a gross figure in your feasibility report. In other words, if you followed the suggestion of the Secretary of Agriculture, what would happen to this project? Would it be economically infeasible?

He says here:

Frankly, we are unable to determine from your report whether or not the benefits actually would exceed the cost and that the benefits exceed the cost is a necessary prerequisite to having any economically feasible project.

He says that he cannot figure it out because, in estimating the benefits, gross rather than net crop values have been used.

I want you to assume for the moment that you are going to use the theory of the Secretary of Agriculture. That is, to use the net crop returns rather than the gross crop returns. Would the project then be economically feasible?

Mr. LARSON. From the standpoint of national benefits, I do not see how you can stop with net returns from the crops.

Mr. ENGLE. I am not arguing that. The Secretary of Agriculture may be wrong. What I am asking you to do is to assume for the purpose of this question that he is right. If he is right and if you take the net returns rather than the gross returns, would this project be economically feasible?

Mr. LARSON. In other words, you want to set up a hypothetical condition and ask me to answer the result under that hypothetical condition. Is that right?

Mr. ENGLE. That is right. In other words, assume for the purpose of this question, that you are applying a net crop return rather than a gross crop return as the Secretary of Agriculture contends should be done. Would the project then be economically infeasible?

Mr. LARSON. I would like to ask this question along that line: Does the Secretary of Agriculture say it stops at net benefit, or net return from the crop?

Mr. ENGLE. No; he does not say that. He says, "In this connection we want to make it clear that we are not questioning the propriety of using indirect benefits in justifying the project, but merely pointing out that an incorrect procedure has been used in estimating these benefits."

What I am trying to determine is the effect of using net returns rather than gross returns in determining economic feasiblity on this particular project.

If you assume that method, would that not throw this project into the economic-infeasibility class?

Mr. LARSON. If we set this project up on the basis of benefits to the Nation, not based upon gross crop return, but followed the benefits to the Nation all the way through, in my opinion it would be feasible because the method that we are now working on to use all costs as well as benefits all the way along the line, it shows that the national benefit exceeds the gross crop income.

Mr. ENGLE. Well, I do not want to ask you a question based on an assumption that you do not feel you can make, and which now, without proper study, you could not answer, but what I am trying to determine is whether or not, if you accepted the theory of the Department of Agriculture that net crop returns rather than gross crop returns should be taken, the project would be economically feasible, without making any other assumption?

Mr. LARSON. Congressman, that would be just like asking me, if we could sell half the power and the other half could not be disposed of, would the project be feasible? Under a qualified statement like that, naturally I would probably have to answer "Yes."

Mr. ENGLE. That is what I wanted to know.

Now on page 32 of your statement I notice that you have added $1,689,000 annually, which over the life of this project will amount to

over $100,000,000, which represents the difference between the deteriorated conditions that will occur if supplemental water is not forthcoming and the improved conditions that would accompany the furnishing of additional water.

How do you arrive at that?

Mr. LARSON. During the period 1940 to 1944 they were pumping a little over double the safe recharge. During the past 2 years they pumped about three times the safe recharge.

The water table is constantly dropping. That condition will continue as long as they can possibly make a profit, which means they will pump from a greater depth.

Mr. ENGLE. What you are in fact saying is this: That you give the farmers in that area $1,600,000 benefits because they will not have to pump if this project goes into effect.

Mr. LARSON. They will have to pump, but they will pump from a lesser depth.

Mr. ENGLE. Do you charge, though, these farmers for the power which will be necessary to lift the water 985 feet, to bring it to them?

Mr. LARSON. Yes; we do. That is part of the irrigation cost.

Mr. ENGLE. Is the capital outlay on that charged?

Mr. LARSON. Yes, sir.

Mr. ENGLE. And the maintenance and operation?

Mr. LARSON. That is right. If you notice on this table A–5, you will note that under irrigation—do you see that column?

Mr. ENGLE. It is the third column.

Mr. LARSON. Yes. Bluff Dam, Coconino Dam, Bridge Canyon Dam, and Bridge Canyon Power Plant are considered as a unit in producing that power. Thirty-one percent of the power will be required to lift the water the 985 feet, so that $6,954,000 of Bluff Dam has been allocated to irrigation; $977,000 of Coconino Dam; $50,189,000 of Bridge Canyon Dam, and $18,762,000 of the power plant at Bridge Canyon.

Down in the last item, "Transmission system," $21,408,000 of the transmission system is allocated to irrigation.

Mr. ENGLE. Where is that?

Mr. LARSON. That is the last item on that sheet.

Mr. ENGLE. You charge this to irrigation; is that right?

Mr. LARSON. That is correct.

Mr. ENGLE. But how is it going to be paid?

Mr. LARSON. Well, the total costs allocated to irrigation amount to $399,424,000. Now, a part of that—the greater part of it, in fact—will be paid by revenues from the sale of electrical energy.

Mr. ENGLE. That is what I am getting at. The power is going to carry—is it not—all that lift cost? In other words, when you get right down to it, although you have allocated it to irrigation, you are, in fact, making power revenues pay it, and the irrigators are not paying for it. Is that right?

Mr. LARSON. The power will carry a large part of the cost; that is true, but that is the same principle we use on all irrigation projects of the multiple-purpose type. The revenue from the sale of electrical energy is used to assist irrigation.

Mr. ENGLE. I am aware of that, but the thing I cannot reconcile is counting the saving in pump lift a benefit, and putting it on the

credit side of the ledger to the tune of, as I say, over 78 years, well over $100,000,000, and at the same time not charging irrigation with that. In other words, it would seem to me that you would have to deduct that from the benefits, or rather add it to the power cost. You cannot claim benefits on both sides for it; can you?

Mr. LARSON. I do not see that we are. In other words, the cost of lifting the water is taken into consideration, and by bringing that water in it would permit pumping from a lesser depth simply because part of their needs could be met by supplemental water.

Mr. ENGLE. But all of the water lift, which takes practically one-third of the power in this project, is to be paid for by power revenues; is it not?

Mr. LARSON. That depends on what portion you want to assign. If you say that the revenues from irrigation would be used to pay part of the aqueduct cost or of the operation and maintenance cost, or of the reserve for replacement, that is probably true.

You will also notice over here on table B–5 that irrigation again is charged with a large part of reserve for replacement and operation and maintenance cost at Bridge Canyon Dam and power plant.

Mr. ENGLE. Well, my impression is that the irrigators in this project are not going to retire any part of the capital investment. Is that correct?

Mr. LARSON. That is correct in one sense, but they are paying, for example, $295,200 of the operation and maintenance cost at Bridge Canyon Dam.

Mr. ENGLE. How much?

Mr. LARSON. $295,200 annually.

Mr. ENGLE. I have here, according to Mr. Straus' statement filed in this report on January 26, 1948, a statement that irrigation carries $250,828,500 and that the irrigation costs of operation and maintenance and replacement costs over a 78-year period run $242,112,000, which would mean that the irrigation payments just about balance off the cost of operation and maintenance and replacement cost over a period of 78 years. Is that not right?

Mr. LARSON. Yes; but, as part of that operation and maintenance costs, there is $295,000 of the operation and maintenance costs for Bridge Canyon power plant alone, which is charged to irrigation, and they pay that part of it.

Mr. ENGLE. $295,000?

Mr. LARSON. $295,200 annually. Added in to their operation and maintenance cost is $229,500 of reserve for replacement at Bridge Canyon power plant.

Mr. ENGLE. Assuming that is true, does it not boil down to this: That the irrigators in this project will barely pay for the maintenance and operation of this project over the period of 78 years, and a little more?

Mr. LARSON. They will pay just a little more; that is right, but they are paying their proportionate share of the maintenance and operation of Bridge Canyon Dam and power plant, Coconino Dam, Bluff Dam, and the transmission system that is required to make power available for their pumping plants.

Mr. ENGLE. Now you do give one-third of the total power in this project to that pump lift, do you not?

Mr. LARSON. That is right.

Mr. ENGLE. And you market the other two-thirds?

Mr. LARSON. That is correct.

Mr. ENGLE. Then the other two-thirds of the power which, according to Mr. Strauss' statement over a period of the life of the project, would run $243,000,000 is going to have to carry not only the capital investment of the whole project, but the power plus the irrigation features? Is that approximately correct?

Mr. LARSON. That is probably correct.

Mr. ENGLE. In other words, to put the matter another way: If the Federal Government gives Arizona this project costing $738,000,000, the Arizona farmers will just barely be able to pay for the cost of the operation and maintenance of the irrigation facilities?

Mr. LARSON. They will pay the operation and maintenance and a small amount on the construction cost. The assistance from power from the project will repay the balance. That same principle is true of other projects.

For example, among the other projects in the Bureau, in central Arizona there would be a subsidy from power of about 0.72 mill. In Central Valley the subsidy is 0.68 mill. In Colorado-Big Thompson there is an 0.89-mill subsidy. In Columbia Basin there is a 0.36-mill subsidy; and in the Missouri Basin the subsidy will be 2.47 mills to irrigation.

Mr. ENGLE. Are you saying that the subsidy from power to irrigation is less on this project than it is in some of these others?

Mr. LARSON. That is correct.

Mr. ENGLE. Maybe that is why some of these projects are so sour.

Mr. LARSON. Well——

Mr. ENGLE. I want to read further from this report.

The Department further says:

> The actual relation of benefits to costs is still further obscured by what appears to be a failure to use the market value of power in estimating for evaluation purposes, the cost of pumping the water supply. Market value must be used in economic evaluation because the power has alternative uses.

I assume that what the Department of Agriculture means is that this one-third of the power which is being used to make this power lift of 985 feet is not valued in this report at market levels; is that right? What does the Department of Agriculture mean by that?

Mr. LARSON. The value of the power under any reclamation project is not valued at the market value. It is not on your Central Valley project. It is not on any of them.

On multiple-purpose projects the power that is required for project use, for pumping water, is charged to the project on the basis of the actual cost to the project. That is a principle that has been used in reclamation projects throughout its history.

Mr. ENGLE. You have done that in this instance?

Mr. LARSON. That is right.

Mr. ENGLE. In other words, the power that is going to be used to pump the water out of the Colorado River and put it in the aqueduct is charged against the project at the actual cost; is that right?

Mr. LARSON. That is correct.

Mr. ENGLE. But the power revenues themselves will carry the major part of that; is that right?

Mr. LARSON. That is right.

Mr. ENGLE. Commenting further on benefits, the Secretary of Agriculture states:

While it is necessary that benefits exceed costs if a project is to be considered economically justified, this alone is not sufficient. Sound economics and common sense require, first, the consideration of possible alternatives, and, second, the choice of that alternative yielding the largest return on the investment.

Do you agree with that?

Mr. LARSON. I think that is correct.

Mr. ENGLE. Have the possible alternatives been considered in this instance?

Mr. LARSON. Within the State?

Mr. ENGLE. I mean within the area, the basin.

Mr. LARSON. No, and the reason is that under the Colorado River compact the water has been divided and the State rights for use of their waters must be recognized.

Mr. ENGLE. Now, as an illustration, if you would offer to lift water, for instance, 985 feet for Nevada, they could use more than 300,000 acre-feet, could they not? Nevada could use more than 300,000 acre-feet, could they not, in your opinion?

Mr. LARSON. Included in the potential projects in Nevada, for the use of 300,000 acre-feet of water, there is one project that contemplates a maximum lift of 1,100 feet in the Las Vegas area.

Mr. ENGLE. Is that true, also, for New Mexico?

Mr. LARSON. I am not familiar with what the pump lifts are in New Mexico.

Mr. ENGLE. What I am saying is that if we are going to make this power lift for Arizona why should not everybody else be considered on an equal basis, to get a slice of that power for the same purpose? Is that not fair?

Mr. LARSON. Well, under these multiple-purpose projects there is no difference in principle applied here than is applied on others. Power will assist the irrigators. That same principle has been applied on other projects. There is nothing different about it.

Mr. ENGLE. I think that is true. It is just a matter of degree.

The Federal Power Commission points out that there is no essential physical relationship between the Bridge Canyon power project and the Central Arizona diversion project, but that the two are linked together in the report because of the need for subsidies from electric-power income to help finance the irrigation improvement. It also indicates that the burden of the irrigation costs are considerable, and that the proposed charges for electric power consequently approach a level where such power cannot be classed as "low-cost" in this region.

Is that right?

Mr. LARSON. I class it as low-cost. For example, if the alternative cost of producing power runs from 6 to 8 mills, and this power can be disposed of at 4.65 mills, I would certainly class it as being well within the competitive range of cheap power.

Mr. ENGLE. In other words, you disagree with the Federal Power Commission, and I assume you do?

Mr. LARSON. On the basis of the figures we have, I would class it as cheap power.

Mr. ENGLE. Here is another point, reading from page 3:

The State of Nevada says, "There is a grave question regarding the availability of water to Arizona to supply the project. * * * Studies have been made by

California and Nevada engineers which show there will be little or no water for the central Arizona project. * * * Investigations and reports should be held up or be only preliminary in character where there is a question as to availability of water." The State of Nevada further says that some engineers have expressed an opinion that the Bridge Canyon Dam and Reservoir cannot be utilized properly and to its full extent as a power project because of the limited storage behind the dam which in a few years would fill with silt and power service would depend on natural fluctuating river flow. They raise questions as to whether it would not be desirable to construct Glen Canyon, which would provide much additional storage capacity, at the same time as Bridge Canyon.

Now, is it a fact that these three dams will silt up so fast that they will not last the life of this project?

Mr. LARSON. No, that is entirely untrue. For example, the power that could be made available from Bridge Canyon could be absorbed within the market area immediately. The next potential development would be Glen Canyon. We have completed the field investigation on Glen Canyon, and in the study on this particular report we assumed that Glen Canyon would be built within 15 years, and probably sooner. Therefore, the life of Bridge Canyon Reservoir would be indefinite.

Mr. ENGLE. Are you predicating this favorable report on the assumption that Glen Canyon will be built within the next 15 years?

Mr. LARSON. Assuming the silt benefit, we only considered 15 years for Bridge Canyon. That is in crediting Bridge Canyon with silt benefit. Beyond the 15-year period that credit, of course, would go to Glen Canyon.

Mr. ENGLE. In other words, what you are going to have to do, in order to really make this project work for the life of the project, is to build Glen Canyon, is that not true?

Mr. LARSON. We assume Glen Canyon will be built within a period of 15 years.

Mr. ENGLE. Is that assumption a necessary assumption for this project to be economically feasible?

Mr. LARSON. Not entirely.

Mr. ENGLE. Are you sure about that?

Mr. LARSON. The power possibility may be reduced some within a 70-year period without Glen Canyon.

Mr. ENGLE. Well, I understand that those dams will silt up in as little as 40 or 50 years.

Mr. LARSON. That may be true if you assume the silt inflow and base it only upon the storage capacity of a reservoir. For example, as a silt delta forms at the upper end of the reservoir, it will slope upstream at least 1 foot per mile, and probably 1½ feet. Therefore, the quantity of silt that will be deposited in a reservoir before the life of that reservoir is lost will far exceed the capacity of the reservoir.

Mr. ENGLE. How much will this Glen Canyon project cost?

Mr. LARSON. We do not have an estimate on Glen Canyon at the present time.

Mr. ENGLE. Well, it would cost as much as $200,000,000, would it not?

Mr. LARSON. Glen Canyon would be an entirely different project. It would have to stand on its own. The power revenues from Glen Canyon would pay the entire cost. It would not be a burden or cost to the central Arizona project.

Mr. ENGLE. I realize that, but I am thinking in terms of these other projects silting up, and your having to build Glen Canyon in order to extend the life of them. If these dam sites will silt up in 40 or 50 years, and the life of this project is 78 years, you are going to have to have something to balance out those dam sites for some 20 or 25 years prior to the time this project would pay out.

Mr. LARSON. Glen Canyon would be built to supply power to the market area and not to keep silt out of these dams. The power demanded in the area is sufficiently great to require that at the present time.

Mr. ENGLE. I notice that Mr. Straus, in his statement, predicated his figures upon $4.50 per acre for this water, but you in your report predicted your economic feasibility on $4.75. How does it happen that you made that change?

Mr. LARSON. We used $4.50 in our original studies. It was suggested in the Commissioner's office that we use $4.75. You will note in the Commissioner's letter to the Secretary he proposed that change. Therefore, in the statement that I presented yesterday we also used $4.75.

Mr. ENGLE. I notice further that on page 31 of your statement you say:

> This price is predicated upon repayment ability studies made of the project area, based on 1939 to 1944 average values of crops at the farm.

It would seem to me that you are being extremely optimistic to adopt the highest farm prices, practically, in the history of the country, to determine the economic feasibility of this project.

Mr. LARSON. No, we have not. In other words, we have shown the costs of this project based on the costs as of July 1947. The costs of construction are about double those of 1940, or approximately four times the costs as of 1910.

Now, then, on the benefits that we have used for irrigation, it is about 20 percent above the 1923 to 1943 gross value of crops. In other words, we have just about doubled the costs of construction and we have increased the value of the crops by 20 percent in showing the cost of the project.

Mr. ENGLE. I know; but you are still being a little optimistic, are you not, to assume that agricultural crops will maintain the same high level that they had in 1939 to 1944?

Mr. LARSON. Well, I believe that any resulting difference would be offset in the operation and maintenance costs we have set up, and also in a lesser construction cost. If the value of farm products goes down, undoubtedly the cost of construction will also go down. I think one would offset the other.

Mr. ENGLE. That is not the point. What if you build this project at the present cost, and 10 years from now your agricultural prices are half what they were then? You would go broke, would you not?

Mr. LARSON. I think that is beyond the realm of possibility.

For example, it would probably take 10 or 15 years to build the project, so if you have a drop in prices of farm products you would certainly realize a benefit from the decrease in construction costs as well.

Mr. ENGLE. Not so soon. The point I am getting at is that you

have to predicate your construction costs on what the costs are today, but when you are building a 78-year project you have to anticipate your agricultural returns on a long-range basis. Certainly picking out 1939 to 1944 as your agricultural price is the height of optimism.

Mr. LARSON. I do not believe it is. The estimated future returns from agriculture was decided on after a long study made by the Bureau of Reclamation, Department of Agriculture, and the Bureau of the Budget. It is a period adopted by those agencies. I do not believe it is optimistic.

Mr. ENGLE. That does not sanctify it. I am sure that to the average fellow, thinking in terms of a business program extending over a period of 78 years, he would want to be pretty cautious about predicating a successful business venture, based on agricultural production on prices which were the highest in the history of American agriculture.

Mr. LARSON. On the basis of present trends of costs, I do not believe so, Congressman. The trends have always been upward. With a small percentage, as used in the value of those crops, I do not think that is unreasonable at all.

This may be of some interest in connection with construction-cost trends, which shows what happens: You will notice back in the period 1905 to 1910 the indexes is about 100. During the First World War it went up to about 250, and then leveled back in the 1930's to about 200. In the Second World War War we were up to above 400 percent. Undoubtedly it will level off some, but the general trend is nevertheless an upward trend.

Mr. ENGLE. I will agree with you on construction costs.

Mr. BARRETT. Excuse me just a moment. Those are very interesting facts. Let me see that for just a moment.

Do I understand that starting before the First World War it was at 100, and then it went up to 200?

Mr. LARSON. Up to about 250.

Mr. BARRETT. And then it went back to 200?

Mr. LARSON. It went back to about 200.

Mr. BARRETT. And then doubled that?

Mr. LARSON. In the Second World War it went over 400.

Mr. BARRETT. It seems that just before the First World War the indexes doubled, from 100 to 200-plus, then receded to 200, and doubled to 400 during the second war, is that right?

Mr. LARSON. Yes, sir.

Mr. BARRETT. If they came back on the same proposition, that would bring them back about how far?

Mr. LARSON. If you take the 1939 to 1944, that would be in this period [indicating] so that you would have to drop back to about 300.

Mr. BARRETT. That would be about the same proportion that it dropped back before, from 400 back to 300?

Mr. LARSON. That is right.

Mr. ENGLE. Do you have a long-range graph on agricultural prices which would reflect a similar trend? Do you have one in your book?

Mr. LARSON. I do not have one in the book. However, I think I could furnish the committee one.

Mr. ENGLE. It would be very interesting, because as I say, it is one

thing to talk about construction costs which will accrue in a relatively short time, and another thing to talk about agricultural returns which are predicated on a 78-year average of prices equaling the 1939 to 1944 level.

Mr. LARSON. I can safely say that the trend for the agricultural products is upward. They probably will not parallel construction costs, but the trend will be the same.

Mr. WELCH. Mr. Chairman?

Mr. MURDOCK. Will you yield to Mr. Welch?

Mr. ENGLE. Yes; I will yield.

Mr. WELCH. I would like to ask my colleague from California what particular point he aims to develop through the witnesses? Is this the financial feasibility or infeasibility of the project?

Mr. ENGLE. That is correct. The Department of Agriculture, Mr. Welch, in its comment on the report of the Bureau of Reclamation, made the statement that it has grave doubts about this project being economically feasible. Specifically, the Department of Agriculture questions that the benefits actually exceed the costs.

The Secretary of Agriculture raises certain very pertinent questions on that score, so I am trying to determine how the Bureau arrived at these figures and whether or not the Secretary of Agriculture's viewpoint is to be given very much consideration. At least, I would like to have the Bureau's comment on it. That is what Mr. Larson is doing. He is commenting on how he arrived at these figures.

These questions which I have raised are questions which have been raised by these agencies in one form or another.

Mr. LARSON. In regard to your question on agricultural prices, Congressman, I was furnished this information from data available to the Bureau office: From 1910 to 1914 the index is 100. From 1920 to 1940, 123. From 1939 to 1944, 143.

Mr. ENGLE. Do you know how that corresponds with the rise in construction costs?

Mr. LARSON. That would be less. In other words, 1939 to 1944 would be about 143, in comparison to about 300 in the construction costs.

Mr. ENGLE. I notice on page 33 of your statement, at the bottom of the page, you say:

> In lieu of a more accurate determination they have been considered as being equal to the estimated revenue derived from the sale of water.

You are referring, there, to municipal water supply benefits.

The thing that impresses me throughout this entire presentation, Mr. Larson, is that the costs are known and are pretty fairly and accurately estimated.

Mr. LARSON. That is right.

Mr. ENGLE. But when you start estimating the benefits and the indirect benefits for the purpose of showing economic feasibility, all of them are based more or less upon vague guesses. This is an illustration of it:

> In lieu of a more accurate determination they have been considered as being equal to the estimated revenue derived from the sale of water.

Why do you say, "In lieu of a more accurate determination they have been considered as being equal"? Why should you do that?

Mr. LARSON. I would say that is the very minimum benefit. I be-

lieve it could be proven that it would be much greater. The benefit from the sale of that water should be worth at least the sale price of the water.

Mr. ENGLE. Another illustration is on page 34 of your statement, where you refer to the recreation benefits.

When we had H. R. 1770 before our committee I raised some questions about how to determine recreation benefits.

In this statement you say that the recreation benefits have been estimated at $1,482,000 a year, which over the life of this project, would run over $100,000,000, or approximately one-seventh of the project cost. How in the world do you determine the recreation benefits?

Mr. LARSON. We, as the Bureau, did not determine the benefits for recreation. The estimated benefits were determined by the National Park Service.

Mr. ENGLE. But you did not just take their word for it, when you are going to be responsible for this project, did you?

Mr. LARSON. I am not entirely familiar with their methods of determining that benefit.

Mr. ENGLE. That would certainly be a very interesting matter. I would like to know how you figure out these benefits, and how these benefits are figured with regard to the construction cost. How are these benefits figured, the recreational benefits of $37,459,000; the fish and wildlife benefits of $3,129,000; and the salinity control at $4,986,000? That is shown on your construction costs. Those are all intangibles which go to make up that 1.59 benefit to cost ratio, are they not?

Mr. LARSON. That is right. Those benefits have been determined on the basis of national benefit.

Mr. ENGLE. Can you tell me how they arrive at it?

Mr. LARSON. On the basis of the number of visitors that would visit the projects, and what the value of that travel would be from a national standpoint. A man takes a vacation, for example, and goes out to one of those dams. He buys gasoline along the way, tires, lodging, and so forth. That is a benefit to the Nation.

Mr. ENGLE. But if he did not go there he would go some place else.

Mr. LARSON. Possibly.

Mr. ENGLE. Then the benefit will occur to the Nation, anyway, one way or the other.

Mr. LARSON. It may or may not.

Mr. ENGLE. I think he would probably go down to Lake Mead, if this one were not there. In other words, when you start saying that the benefits from recreation are those which result from the expenditure of money because the recreation facilities are there for visitors, you are assuming that in the absence of those facilities that money would not be spent, whereas that is not the ordinary assumption, is it?

Mr. LARSON. As I say, Congressman, I am not fully familiar with the methods they used, but it is something along that line. However, we have to remember this: With our increasing population unless there are additional recreation attractions, the people will not travel. Even now you run into people that have made trips to Yellowstone Park or other parks. They are very much disappointed because they

think of going to a park where they at least have elbow room, and they often find crowded conditions at the existing parks.

Mr. ENGLE. I can also say this: If the recreation and fish and wildlife and silt control and salinity control are written into these projects on such a substantial basis as nonreimbursable features, there just is not any project that you cannot say is feasible. They will all be feasible if you put enough in.

Mr. LARSON. I would like to add this: On these projects that you are thinking about or mentioned, probably they would not accommodate many more people without having crowded conditions. I think it is very safe to estimate that at least 500,000 people annually would visit Bridge Canyon recreational area.

Mr. ENGLE. It is my point that if they did not go there they would go some place else; and if they did not spend the money for recreation they would spend the money to buy shoes, or maybe to buy cigars, and the result to the national income would be the same. The expenditure of the total amount of the consumers' money in the country will not be increased, and any assumption of benefits predicated on that is false.

Mr. WELCH. May I say something off the record.

(Discussion off the record.)

Mr. ENGLE. I now refer to page 4 of the statement of the Bureau of the Budget, their letter of February 4, 1949, adversely reporting on this project, where it is stated and I quote:

> The State of Nevada, in commenting on the economic justification of the project—

By the way, I think the record should show that Nevada is opposed to this project also; California is not alone—

> computes the net irrigation construction costs on the acreage which will be salvaged by the project at $1,469 per acre and questions the justification of such costs in the face of an estimated farm land value with irrigation of $300 per acre.

Do you have any comment to make on that?

Mr. LARSON. Yes; the costs on the basis of the per-acre figure, as I would see it, would be $625.

Mr. ENGLE. How do you arrive at that?

Mr. LARSON. $399,000,000 is allocated to irrigation to furnish supplemental water. That supplemental water will benefit 640,000 acres; not 226,000 but 640,000 because all of the area within the project boundary requires supplemental water.

Mr. ENGLE. Tell me this: How many acres will go out of production if this project is not built?

Mr. LARSON. How would it be possible to take land out of production in that sense? They have been pumping at least double the recharge. In fact, at the present time, they are pumping about three times the recharge to the ground-water basin. The ground-water basin is being depleted and it is a case of survival of the fittest. I do not know how you could actually go in and take out a certain area of the land.

Mr. ENGLE. Let us just assume that this project is not built. How many acres will go out of production which are now in production?

Mr. LARSON. There will be continual competition for water as long as it is available, which means that they will greatly deplete their ground-water supply, so that when land does go out of production

there will be considerably more than the 226,000. Until the groundwater has a chance to come back up again, large areas would remain out of production and that would be a rather long period of time.

Mr. ENGLE. I think the way to arrive at the net land benefited is to say how much land which is now susceptible to irrigation will not be irrigated if the project is not built. That brings us right to the real crux of the question. My information is that about 150,000 acres would go out of production if this project is not built. Is that a fair estimate?

Mr. LARSON. Some land is not in production now because of water shortage.

Mr. ENGLE. How many acres will get a full supply?

Mr. LARSON. Six hundred and forty thousand.

Mr. ENGLE. That is, including the land which will get a supplemental supply, is it not?

Mr. LARSON. All the water would be required for supplemental needs.

Mr. ENGLE. You mean to say there is no land which is not now being irrigated which will be irrigated if this project goes through?

Mr. LARSON. All of the land that would be furnished water has been farmed and irrigated at one time.

Mr. ENGLE. I agree with that. How much of that land will be abandoned if this project does not go through?

Mr. LARSON. In my opinion, at least one-third of it would eventually go out of production.

Mr. ENGLE. That would be about 200,000 acres, then?

Mr. LARSON. About 230,000 on that basis.

Mr. ENGLE. How much is that per acre on the capital investment of this project?

Mr. LARSON. There, again, the loss to the area would be considerably greater than the cost of that land. For example, the land that would go out of production would supply the source of income for the livelihood of many beyond the farm.

Mr. ENGLE. Just to take an easy figure, if there are 300,000 acres which will go out, you will have $1,345, approximately, in capital investment on this project per acre, is that about right?

Mr. ASPINALL. Mr. Chairman, will the gentleman from California yield for a moment?

Mr. ENGLE. Yes.

Mr. ASPINALL. Are you assuming full production on the balance? Your question, without that assumption is open to question.

Mr. ENGLE. I am just taking the witness' statement that one-third would go out of production. I think, probably, the witness will say there will be some of the remaining two-thirds which would not have full water, is that not correct?

Mr. LARSON. On that hypothetical condition that is correct.

Mr. ENGLE. Does that answer your question?

Mr. ASPINALL. Yes.

Mr. ENGLE. This is just an approximation.

How many acres will make a family-sized farm?

Mr. LARSON. One hundred and sixty acres.

Mr. ENGLE. One hundred and sixty?

Mr. LARSON. That is the limit under the reclamation law.

Mr. ENGLE. You do not need that much, do you? If you considered it 100 acres you would have $134,500 in capital investment out of this project on every family-sized farm. That is a lot of money.

Mr. LARSON. Continue on from there. Agriculture in the area is the basic support of their economy. So, for example, when you wipe out one-third of the irrigated land what about the one-third of their general economy? The grocery man, the banker, the fellow who sells gasoline, and so forth; all of those people are depending upon the economy of that area. If you wiped out one-third of the irrigated land you certainly affect the economy beyond that of the farmers.

Mr. ENGLE. I would certainly agree with you on that, but the point I am making is that if for every 100-acre farm you have in that area the Federal Government has to put in the sum of $134,500 in capital outlay, to get water on that land, you have spent a lot of money, have you not?

What I am driving at is this: Is Nevada correct, or at least approximately correct, in its assumption, mentioned by the Bureau of the Budget in its letter on this project?

Mr. LARSON. No. When they look to the cost of the project per acre, I do not think it is correct because it is a supplemental water supply and it affects the entire acreage, not any hypothetical portion of it.

Mr. ENGLE. If it is even approximately correct, it is a staggering figure, it seems to me.

Mr. POULSON. Will my colleague yield?

Mr. ENGLE. Yes.

Mr. POULSON. It looks like the water they are using to prime the pump is as much or more than the water they are getting from the pump.

Mr. ENGLE. It is not quite that, Mr. Poulson, but it means that the Federal Government is putting up a huge amount of money in capital investment to keep lands in irrigation.

Mr. POULSON. Yes.

Mr. ENGLE. There is one other question I have and then I will quit. I have taken longer than I intended to.

On page 38 of your statement you say:

> Under provisions of the bill now under consideration the project would pay out.

Is that right?

Mr. LARSON. That is right.

Mr. ENGLE. I am reading from page 2 of the bill, line 12, which states as follows:

> (2) A related system of main conduits and canals, including a tunnel and main canal from the reservoir above the dam at Bridge Canyon to the Salt River above Granite Reef Dam—

This is part of the authorization in this bill. Does that relate to the 79½-mile tunnel from Bridge Canyon?

Mr. LARSON. That has reference to the Bridge Canyon tunnel.

Mr. ENGLE. That is the bill we have under consideration, is it not, Mr. Chairman, H. R. 934?

Mr. MURDOCK. That is right.

Mr. LARSON. Read on further and it says that would be deferred until such time as the value of the power used in pumping would justify constructing the tunnel.

Mr. ENGLE. The point I am getting at is that this bill authorizes the canal and transfers then from this committee to the Appropriations Committee the determination of feasibility; is that not right?

If we pass this bill in this form, it takes out of the hands of this committee the right to determine economic feasibility, does it not?

Mr. LARSON. I do not know. I would not attempt to answer that question.

Mr. ENGLE. The Bureau of Reclamation filed a report which is, as I figure it, about 8 pounds of material, but in looking over your figures I find they are different from those figures submitted by that report. Every figure in the list has been changed.

I refer you to the back part of your statement, which is one of the exhibits here, the allocation of costs which I believe is A–5. It is my impression that every figure submitted in your table, except the first and the last is different from the figures submitted by the Bureau of Reclamation in its report on this project.

For instance, I have noticed that on recreation nonreimbursables, which I have mentioned before, you give $32,943,000, whereas Mr. Straus in his report puts that at $37,000,000. Other figures also vary. Is that correct?

Mr. LARSON. The reason for that is in the repayment provisions of the various cases cited. For example, as you pointed out in the report under the reclamation law, we used a repayment period of 50 years. Under the Rockwell bill or a combination of the Rockwell bill and S. 1175 it was a 78-year period. Under S. 1175 it was a 78-year period. Under the figures I have included in my statement yesterday it is a 70-year repayment period. That would account for a difference in those allocations of cost, because you are repaying the cost in a different period of time.

Mr. ENGLE. I agree with you that your figures are different. The point I want to make is that the figures submitted here have never been formally reported on with substantiating data, is that not correct?

In other words, your report which you read yesterday, Mr. Larson, is wholly at variance in its break-down with the figures in the report, and the substantiating data which has been submitted by the Bureau of Reclamation. Therefore, this committee and the interested States have never had an opportunity to examine those figures and the substantiating data in the same fashion as they had with the submission of this report, is that not correct?

Mr. LARSON. Congressman, you speak as though the figures I have used here are entirely different. The figures in that report are exactly the same as we used in this, with the exception of the effects upon the repayment provisions which are slightly modified in this bill which we are called to report upon.

Now, for example, if we were called on to report on S. 1175, or repayment provisions exactly the same as S. 1175 they would be contained in there. The repayment provisions of this bill are slightly different from any previous bill.

Naturally, we had to make some changes and figure out the repayment ability on the provisions of this bill which we are called to report upon.

Mr. ENGLE. I am not criticizing you for it. You were perfectly justified in making a report on the bill on which you were asked to

report. The point I am making is that the other parties have not had an opportunity to examine those figures and the report predicated upon those figures has not been circulated to the State authorities, as required by the Flood Control Act of 1944.

Mr. LARSON. You will find this, Congressman, if you compare the figures in that report in accordance with the repayment provisions of S. 1175: They will be very close to the ones we have with this exception, that the repayment period is 78 years, and the power would sell for 4.48 mills instead of 4.65 mills.

Mr. ENGLE. I am not going to question that at all. The point I am making, which I think is true, is that the figures you have submitted have never been submitted with substantiating data such as is contained in this 8-pound report.

Mr. LARSON. That is correct.

Mr. ENGLE. That is all, Mr. Chairman.

Mr. MURDOCK. We have asked permission to bring up under unanimous consent an important bill today which needs to be passed today or sometime this week, so that we may get it enacted before May 1. I would like for the committee to adjourn perhaps 10 minutes before 12, so that we may go over to the House on time and back this bill up. It is H. R. 4152, and it is highly important that we get the bill which this committee reported out unanimously enacted, if possible.

Mr. WELCH. That is the so-called omnibus bill?

Mr. MURDOCK. That is right.

Mr. ENGLE. Off the record.

(Discussion off the record.)

Mr. MURDOCK. The Chair wishes to recognize all gentlemen in order. We are not going to have time to go very much into this from now on this morning. You will be available tomorrow morning for questioning, will you not, Mr. Larson?

Mr. LARSON. That is right.

Mr. MURDOCK. The Chair would like to ask Congressman Engle a question, since our time is so short, but before doing so, wishes to state that Congressman Engle has now taken 1 hour and 20 minutes, and quite properly so, if such is his viewpoint, to show that the report which we received yesterday from the Department is not a very good report. I felt, myself, that it was a good report.

Numerous authorities have been quoted. One of the highest authorities of which I have any knowledge says this: "Where there is no vision the people perish." I should like to enter that as one of the authorities in our planning here.

A good deal has been said just recently in the colloquy regarding the cost per acre. The total report, as given by Mr. Larson's testimony shows that the entire State of Arizona, with portions of two neighboring States, will be beneficially affected by this program.

There are 73 million acres of land in the State of Arizona, and you might just as well divide the total cost of this water project by 73 million, as by the smaller divisor which was used in the testimony a moment ago.

I want this larger benefit to be pointed out with reference to the fact that "where there is no vision the people perish." If we have no vision of the 17 Western States we are going to be in hard circumstances, beginning immediately and throughout the coming years.

I noticed when we had H. R. 1770 before our committee, Congressman Welch very emphatically brought out this fact, and that is that if we do not use the interest component, if we do not use hydroelectric power as a paying partner, some irrigation cannot be had. I want to read just a statement by Congressman Welch:

May I ask the Commissioner if this power aid to irrigation were removed from legislation and irrigators in the Central Valley of California were required to pay directly the full amount of the capital invested allocated to irrigation, is it not a fact that they would have to pay approximately 3 times as much for water?

The Commissioner said they would have to pay about 3 times as much if they were able and he went ahead to explain that under those conditions there would be less irrigation in the Central Valley of California and elsewhere.

Did I understand, Mr. Larson, from your testimony, that the computed subsidy of power in the central Arizona project is less than some other projects?

Mr. LARSON. It is less than some of the projects.

Mr. MURDOCK. Can you state what other projects?

Mr. LARSON. Well, in the Missouri Basin it is 2.47 mills, as compared to 0.72 mill in the central Arizona project. Or, in the Colorado Big Thompson, it is 0.89 mills.

Mr. MURDOCK. The question I wanted to ask Mr. Engle—I will not take quite that much time to ask it—is this: Congressman Engle, there were two things. You were inclined to ask whether they had not exceeded their authority when they went ahead and spent $200,000 to investigate this project under which there is, in your mind, a shadow of legal doubt.

Mr. Larson, I wanted to ask you, has the Department, to your knowledge, the Bureau of Reclamation, been asked by the city of San Diego, to make any studies for further development of its water supply?

Mr. LARSON. Yes, the Bureau of Reclamation has been asked to investigate the second barrel of the San Diego aqueduct in which there is also a questionable water supply.

Mr. POULSON. Would the gentleman yield at that point?

In building that main aqueduct which went over there from the metropolitan aqueduct, the State of California paid for it, did they not, the main aqueduct? The Government did not pay for it.

Mr. MURDOCK. We are not talking about the main aqueduct to Los Angeles.

Mr. POULSON. I am just bringing it in at this point, about the difference between the two projects, if you are going to make a comparison.

Mr. MURDOCK. I am making no comparison at this time of the costs of aqueducts. The point I want to make is that the city of San Diego has asked the Bureau to make this investigation of it. Therefore, the same criticism applies. I do not criticize it.

Mr. POULSON. I am not questioning any investigation, but I want to bring up at this point that when we have an aqueduct over in California that we paid for our aqueduct.

Mr. MURDOCK. We are going to hear a lot more about that aqueduct. I take off my hat to the people of Los Angeles, who paid upward of $200,000,000 for such an aqueduct. I have nothing to criticize on the engineering phase of it.

The only thing I say now with regard to that magnificent aqueduct is that that is being put up as a front to fight my bill when it has no relationship, no important direct relationship to the bill before us. I shall certainly expose these questionable ethics later.

The point I want to make is that I think Congressman Engle went out of his way a little too much, yesterday, by stating that the Department had no business spending $200,000 of the taxpayers' money to carry on this investigation of the Central Arizona project. We know very well, according to that 8-pound report which you have there, the Bureau took into consideration every possible project that might be had in the Colorado Basin, and there are 134 of them. It takes no genius to figure out that more than half of those can never be realized. But we do not economize by failing to investigate a probable worthy one.

This great Department, with vision in reshaping the 17 Western States, has to consider every possibility, and we have to spend some money. Congress has been appropriating annually $500,000 to carry on these investigations, some of them in the lower basin, and right now most of them in the upper basin, but the investigations have to be carried on.

I wanted that point clearly made for the record.

Mr. ENGLE. Would the gentleman yield?

Mr. MURDOCK. Yes; I would be glad to.

Mr. ENGLE. I did not question the legal authority of the Bureau to spend the money. I questioned the good judgment of spending the money. I questioned, also, the propriety, as I did in the beginning of this proceeding, of taking time and spending money in the consideration of a project for which there is no assured water supply.

In other words, my point is, Mr. Chairman, that so long as there is a legal question about the water supply that should be determined first. I have always felt that, and I have felt if it were determined it would immensely lighten the burden on Arizona, so far as this project is concerned, if Arizona happens to be successful in the litigation. I said this yesterday with respect to the expenditure of $200,000, plus $200,000 put up by Arizona.

If it develops, after this case goes to court that Arizona is in error in its contentions, or any of them, the money will be wholly wasted. It, to me, is comparable to undertaking an engineering survey on the building of a $738,000,000 skyscraper on a lot on which there is a legal controversy as to the title. The thing to do is to settle the controversy as to the title first.

Mr. MURDOCK. Did the gentleman take that same stand in 1927 and 1928 before the passage of the Boulder Canyon Project Act?

Mr. ENGLE. We agreed on the Boulder Canyon Project Act, in order to get a concurrence.

Mr. MURDOCK. The Supreme Court did not declare California's portion. There was no settlement by court prior to the passage of the Boulder Canyon Project Act. Congress did it.

Mr. ENGLE. But we came to Congress and got an authorization, and agreed to the Self-Limitation Act. We passed the Self-Limitation Act. In other words, we accepted the imposition of terms prescribed by the National Congress in that Self-Limitation Act.

Mr. MURDOCK. Just exactly what H. R. 934 is attempting to do, to

get an authorization act. There was a lawsuit after the act of 1928 was passed, and the act was upheld. Let us have an authorization act, and then you can get before the Supreme Court. Now you have no justiciable issue. Only delay, tragic to Arizona, would result.

Of course, we will fight this out also in another committee.

Mr. ENGLE. The question is which came first, the hen or the egg.

Mr. MILES. Let me say something off the record.

Mr. MURDOCK. Put it on the record. We want to hear you, Governor.

Mr. MILES. There is a great deal of interest here by all concerned. Let us bear with each other and one another very patiently and very calmly and very sincerely. I can realize that there is a great deal of interest here, and sometimes one word may cause an eruption which would not be to the interest of all of us. Let us do bear that in mind.

Mr. MURDOCK. You are a very wise man, Governor.

Chairman Welch, have you any questions to ask?

Mr. WELCH. No questions.

Mr. MURDOCK. Congressman Poulson?

Mr. POULSON. I have a lot of questions. I would prefer to start tomorrow.

Mr. MURDOCK. Perhaps you had better start tomorrow, then.

With that understanding the committee will be adjourned until 10 o'clock tomorrow morning.

(Thereupon, at 11:42 a. m., Thursday, April 28, 1949, an adjournment was taken until 10 a. m., Friday, April 29, 1949.)

THE CENTRAL ARIZONA PROJECT

THURSDAY, MAY 5, 1949

HOUSE OF REPRESENTATIVES,
SUBCOMMITTEE ON IRRIGATION AND RECLAMATION
OF THE COMMITTEE ON PUBLIC LANDS,
Washington, D. C.

The subcommittee met, pursuant to adjournment, at 9:30 a. m., in the anteroom of the Committee Room of the House Committee on Public Lands, the Honorable John R. Murdock (chairman of the subcommittee), presiding.

Mr. MURDOCK. The subcommittee will come to order, please.

At the last session of the subcommittee considering H. R. 934 we had a representative of the Bureau of Reclamation on the stand, Mr. Larson, who had made his statement and who was being questioned by members of the committee.

Mr. Larson, will you take the stand, please. I was hoping that we could raise our questions with Mr. Larson, so that he can get away. He is from out West, and he has official duties that are being neglected by his attendance at these sessions. Both are quite important.

STATEMENT OF V. E. LARSON, ASSISTANT REGIONAL PLANNING ENGINEER FOR REGION III, BUREAU OF RECLAMATION, DEPARTMENT OF THE INTERIOR—Resumed

Mr. LARSON. Mr. Chairman, with your permission I have some charts prepared that I think would be of some interest.

I believe possibly some of the Members would like to see those. They have been prepared in connection with the questions that came up at the last hearing in regard to the base period used in determining the value of the farm crops in relation to the present value, and the indexes we used in determining construction costs of this project.

As was stated the other day, we use a base period of 1939–44 in estimating the value of the farm products.

As shown on this chart, it is considerably below the present value or the value of recent years. For example, the heavy line shown as the 1939–44 farm product average is far below the indexes we used in determining the construction costs.

Mr. MURDOCK. The question raised, I believe, at the last session was this: Have you not erred in using those figures? Your answer here is that there has been an upward trend which may be expected to remain, not as high as it is now, but high during the immediate future; is that correct?

Mr. LARSON. It appears very probable that the future value of farm products would be above the 1939–44 base period that we had used. In other words, it seems that we have been ultraconservative in using the base period we have used.

Mr. MURDOCK. Some question was raised the other day about the use of the gross farm receipts or farm returns. What other method could be used, if any?

Mr. LARSON. We are now working on a method to determine the net benefits resulting from the growing and sale of farm products. Although that method has not been perfected as yet, by applying that method to some of the smaller projects it has indicated the net benefit will exceed the gross crop income. So there, again, it appears that by using the gross crop income as a measure of benefits the net benefit would probably exceed that figure.

Mr. MURDOCK. While I have many questions, our time is going to be limited this morning.

We adjourned the other day with the understanding that Mr. Poulson would have the privilege of asking questions first.

Mr. D'EWART. Would you yield to me to ask one question?

Mr. POULSON. Yes.

Mr. D'EWART. To me this chart indicates that your engineering people have not been as effective in applying efficient operations to their method since 1920 as the farm operations. Perhaps you need a little more study of efficiency methods in engineering work.

Mr. LARSON. I do not think it is in the engineering. The basis of this trend is pretty much determined by the cost of construction. It is influenced by the prices bid by contractors to construct the works.

Mr. D'EWART. That depends on their efficiency in operation?

Mr. LARSON. That is right.

Mr. D'EWART. Including overhead. This graph certainly indicates that the farmers have been doing a better job along that line than the engineers.

Mr. LEMKE. That is perfectly natural. Will you yield for a question?

Mr. POULSON. Yes.

Mr. LEMKE. Your testimony is with regard to the Bridge Canyon project? I was not here the last time. What is this testimony on?

Mr. LARSON. The question came up in regard to the base period we used in determining the gross crop income on this particular project.

Mr. LEMKE. That is the Bridge Canyon project?

Mr. LARSON. That is right. The Central Arizona project.

Mr. LEMKE. Can you tell me about what the charges will be per acre? I am asking that because I have a lot of letters on the subject. Some claim it will be as high as $1.700, and others claim otherwise. Can you tell me roughly what it will be?

Mr. LARSON. By dividing the costs allocated to the irrigation by the number of acres that would be supplied supplemental water supply it would amount to $625 an acre.

Mr. LEMKE. Thank you. That is all.

Mr. POULSON. Mr. Chairman, I have the time at 12 minutes until 10. Do we meet at 10 o'clock?

Mr. MURDOCK. We meet at 10:45 with the full committee.

Mr. POULSON. When do we quit in this committee?

Mr. MURDOCK. Ten forty-five. We go into a full committee session at 10:45.

Mr. POULSON. I see.

Now, Mr. Larson, in your report, in the opening of the report, you bring out in several places and also summarize in your conclusions the statement and the fact that this entire report of yours is predicated

on the basis that Arizona's contentions of the amount of water they are entitled to is correct; is that right?

Mr. LARSON. That is correct.

Mr. POULSON. In other words, if their contentions are not correct this report would not be of great value; is that right? That is, so far as putting in the project is concerned.

Mr. LARSON. Well, it may be to some extent. However, I think the report would probably be of some value.

Mr. POULSON. I mean, as far as a real basis for authorizing the project is concerned.

Mr. LARSON. That may be true. However, we must remember that several features are included in this report that could be constructed, regardless of the outcome of the question over the water rights.

Mr. POULSON. You have not set up any separate bill to set out those particular portions of the project which could be utilized regardless, if the water rights are not taken into consideration, have you?

Mr. LARSON. They have not been set out in this report. However, on the basis that there was a difference in the interpretation of water rights the information available at this time could be used in considering other alternatives.

Mr. POULSON. I might just call to your attention the report which was issued by the Department, page R–23, and repeat again what it says here:

> Because these are legal questions which cannot be arbitrarily settled by the Bureau of Reclamation, it is impossible to determine with finality the amount of water available to the State of Arizona from the Colorado River. The interpretations of all compacts and contracts as used for a basis of computation in this report are those of responsible officials of the State of Arizona. The interpretations thus expressed are not necessarily those of the Bureau of Reclamation or of all other States of the Colorado River Basin.

It is clear when we start out that this is entirely upon the contention that Arizona is correct.

Now, in your report, under the 1944 Flood Control Act, you are to submit to the States various reports. This is the report that was submitted?

Mr. LARSON. That is correct.

Mr. POULSON. The report which you have submitted does not, in its entirety, conform with the report issued by the Secretary of the Interior. You have taken other phases in there and have brought up different points, have you not? You have a different report.

Mr. LARSON. I do not quite understand.

Mr. POULSON. This one is different?

Mr. LARSON. You mean my statement?

Mr. POULSON. Your statement.

Mr. LARSON. The difference is very minor, Congressman Poulson.

Mr. POULSON. For instance, we will go into some of the minor parts.

Mr. LARSON. All right.

Mr. POULSON. Does your report cover, in its entirety, this bill which you are supposed to report on, and which you are asking Congress to pass?

Mr. LARSON. I do not believe the flood control bill actually requires that our report must conform with any particular bill. We are supposed to report on the project, and we have done that.

Mr. POULSON. Does your report conform with this bill in its entirety?

Mr. LARSON. Not entirely, but almost so.

Mr. POULSON. Almost so. Can you tell me where it includes this tunnel on page 2:

Including a tunnel and main canal from the reservoir above the dam at Bridge Canyon to the Salt River above Granite Reef Dam—

Can you tell me where it shows the cost, and where it complies there?

Mr. LARSON. We have shown that in a previous report.

Mr. POULSON. I am speaking about the report that you are appearing before the committee with, and asking us to pass this bill on the basis of your report. Can you show me in your report where that appears?

Mr. LARSON. Other than——

Mr. POULSON. You have set up your figures there showing that they are going to have a return for every dollar we put in of about $1.50. That is based almost entirely on the high prices of today. That is not a good venture, but that is the basis. You have your costs.

Can you tell me how much that Granite Reef Dam will cost?

Mr. LARSON. The Granite Reef Dam?

Mr. POULSON. Yes.

Mr. LARSON. That is here.

Mr. POULSON. I mean the canal, rather.

Mr. LARSON. The Granite Reef aqueduct is $131,716,000.

Mr. POULSON. That is included in there?

Mr. LARSON. Yes, sir.

Mr. POULSON. What about the tunnel?

Mr. LARSON. In the report we indicate that various routes were considered, naming each route, and that we have selected the pumping route as the most feasible.

Mr. POULSON. But you have asked for authority to be authorized a tunnel and a main canal?

Mr. LARSON. If you read down through here, construction of the tunnel is deferred until such time as it would be economically justified.

Mr. POULSON. But you have asked for us to authorize it at this time.

Mr. LARSON. No; I have not.

Mr. POULSON. The bill does.

Mr. LARSON. Probably the bill does.

Mr. POULSON. Your report is not carrying this. In other words, to say it bluntly, you are fooling us. You are not giving us the true picture. You are coming in here to testify on this bill, as well as on the report. You are not including all of the things which you are asking us to authorize.

Mr. LARSON. Excuse me. I missed your question, Congressman.

Mr. POULSON. Well, I said that, bluntly, you are not giving us a true picture. You are really, to speak very bluntly, fooling Congress because you are coming in and talking about subjects that are not in this bill, or, there are subjects in the bill which you are not discussing.

You are asking us to authorize other things. For instance, complete plants, transmission lines, and the fullest economic development of the electric energy. You have a term so wide you allow yourselves to do everything, but you have not discussed these item by item in your report.

We are listening to you as an authority in interpreting what is in this bill. Now you say that your report does not include everything.

As an authority representing the Department, we are looking to you for the honest information about this.

Mr. LARSON. I think our report has shown everything, Congressman. This is not the only report that has been made available in connection with this project.

Mr. POULSON. Why not combine it in one report? You will always come back afterward and say, "It is in another report." You are up here testifying on the project in the bill. You are up here in support of this bill before the committee at this time. In your report should you not have everything that is included in this bill?

Mr. LARSON. I am here to report upon the bill. If there are any questions that you may have in connection with the engineering part of this project I will be glad to try to answer them.

Mr. POULSON. For this authorization of this tunnel, how much is it going to cost?

Mr. LARSON. About $400,000,000.

Mr. POULSON. $400,000,000 in addition to the $800,000,000 you have shown here?

Mr. LARSON. The cost of the tunnel is about $400,000,000.

Mr. POULSON. You are asking us to give you authorization to put that in?

Mr. LARSON. Construction of the tunnel is to be deferred.

Mr. POULSON. But you are still asking for authorization for it?

Mr. LARSON. I am not asking for authorization for it.

Mr. POULSON. The bill is asking for authorization for it.

Mr. LARSON. I am reporting on the engineering aspects.

Mr. POULSON. The bill asks for authorization, does it not?

Mr. LARSON. It asks for authorization and to defer construction until such time as it is economically feasible.

Mr. POULSON. Yes; but it asks authorization.

Mr. LARSON. Let me finish my statement, please.

Mr. POULSON. We are giving you the authorization for it if we pass this bill.

Mr. MURDOCK. Please finish your statement, Mr. Larson, and give the reference to the bill, please.

Mr. LARSON. I beg your pardon?

Mr. MURDOCK. You will find at page 3, beginning with line 20, the reference. Complete your answer and cite the bill at this point to confirm it, if you please.

Mr. LARSON. On line 20:

Provided, however, That construction of the tunnel and that portion of the canal hereinabove described from the reservoir above the dam at Bridge Canyon to a junction with the aqueduct hereinafter authorized shall be deferred until Congress by making appropriation expressly therefor has determined that economic conditions justify its construction, and in order to provide a means of diversion of water from the Colorado River to the main canal pending the construction of said tunnel and said portion of the canal and for use thereafter as supplemental and stand-by works the Secretary is authorized to construct, maintain, and operate from appropriations authorized by this act—

the Havasu plant, and so forth.

Mr. POULSON. It says here—

hereinafter authorized shall be deferred until Congress by making appropriation.

In other words, you are bypassing this committee. We are giving you a blanket authorization, and when you go before the Appropria-

tions Committee the Appropriations Committee is going to decide the feasibility and the economic feasibility.

Mr. D'EWART. Will you yield?

Mr. POULSON. Yes.

Mr. D'EWART. I wonder if such procedure would not be subject to a point of order?

Mr. POULSON. You have brought up a very good point. I think it would.

However, the point I am bringing out, also, Mr. D'Ewart, is the fact that in this bill there are all these blanket authorizations which would absolutely build up the equal to or probably more power than even an authority.

You put in all of these additional authorizations and generalize them without being specific in any way, shape, or form.

How much would this pump lift cost at Lake Havasu? I believe it is about $26,000,000, is it not?

Mr. LARSON. The pumping plant?

Mr. POULSON. Yes.

Mr. LARSON. A little over $25,000,000.

Mr. POULSON. $25,973,000?

Mr. LARSON. That is right.

Mr. POULSON. That is closer to $26,000,000 than a little over $25,000,000, I think.

That would have to be abandoned after you built the canal, would it not?

Mr. LARSON. That is correct.

Mr. POULSON. How much land in this project was under irrigation in 1939?

Mr. LARSON. I do not have the figures for 1939. I can give you 1940 and from then on. In 1940 it was 526,000 acres.

Mr. POULSON. How much in 1945?

Mr. LARSON. 588,000 acres.

Mr. POULSON. 42,000 acres of war-speculation land you want to reclaim, also; is that not right?

Mr. LARSON. No; that is not correct.

Mr. POULSON. According to the report, it says that about 4,000 farms would benefit from the additional water. Is that about right?

Mr. LARSON. During the period previous to 1940 a maximum of 672,000 acres had been irrigated. Some of this land—in fact, a large portion of it—has been out of production because of lack of water, because of lack of power to pump water, and similar reasons.

Mr. POULSON. With reference to these 4,000 farms, is that about the correct amount?

Mr. LARSON. In this particular area that is included within the boundaries of the central Arizona project between the period of 1940 and 1948 there has been an increase in acreage of about 40,000 acres.

Mr. POULSON. Let me get that again.

Mr. LARSON. In the area outlined by the central Arizona project, within that area, there has been approximately a 40,000-acre increase.

Mr. POULSON. Yes. You gave me the figure of 588,000 and 526,000. The difference is 62,000.

Mr. LARSON. Both figures you used there, Congressman——

Mr. POULSON. You gave me 526,000 and then 588,000.

Mr. LARSON. In other words, in 1940 that is one of the lowest run-off periods on record. There was a bad water shortage there at that time.

Mr. POULSON. That still makes 62,000.

Mr. LARSON. But I would not class it as war speculation acreage.

Mr. POULSON. That is when these acres went into operation, though, is it not?

Mr. LARSON. During the war.

Mr. POULSON. You can put your own interpretation on it. About how many farms are there?

Mr. LARSON. I beg your pardon?

Mr. POULSON. Have you the number of farms?

Mr. LARSON. No; I do not have that figure with me.

Mr. POULSON. Are there large holdings in some of these farms?

Mr. LARSON. There are in some.

Mr. POULSON. I saw somewhere in here a statement that said around 4,000 farms were going to be benefited. At that rate, with the project costing about $400,000,000, that would make a cost of $100,000 per farm. That does not look to be in line.

Now, one-third of this power is to be used for the cost. That is, one-third of it is to be used to pay for part of the project. You say that it takes 70 years to pay it out on that basis; is that right?

Mr. LARSON. It requires 70 years to pay out on the basis of selling power at 4.65 mills per kilowatt hour.

Mr. POULSON. What is the market price?

Mr. LARSON. If power is sold for a higher rate it could, naturally, pay out in a much shorter period of time.

Mr. POULSON. What is the market price there now?

Mr. LARSON. For power?

Mr. POULSON. Yes.

Mr. LARSON. On the basis of oil——

Mr. POULSON. What are you paying for it now? What is the market price?

Mr. LARSON. That varies.

For example, some of the new plants which are now being built and are purchasing oil at $2.25 a barrel, if they are paying 5 percent interest on that investment their power will cost 8.74 mills.

If they pay 4 percent on their investment it would cost 8.52 mills.

If it is 3 percent on the investment it would be 8.29 mills.

At a rate of 2 percent on the investment, it will be 8.1 mills.

Now, if they are able to purchase oil at $1.75 per barrel and pay 5 percent on their investment, the power would cost 7.76 mills.

Mr. D'EWART. Might I ask: Whom do you mean by "they"? Is that the private utilities around Phoenix?

Mr. LARSON. It is the utilities in the Southwest area.

In other words, if they pay 5 percent interest on their investment and $1.75 per barrel for oil it would cost them 7.76 mills per kilowatt-hour for power.

Mr. D'EWART. Do they have a sliding-scale rate, depending on all these factors?

Mr. LARSON. That is the average rate for firm energy.

Mr. D'EWART. Yes.

Mr. LARSON. If they pay 4 percent on the investment it would be 7.54 mills.

If they pay 3 percent on the investment it would be 7.3 mills.

If they pay 2 percent on the investment it would be 7.12 mills.

Mr. WELCH. How many plants are generating power through the use of oil?

Mr. LARSON. How many?

Mr. WELCH. Yes.

Mr. LARSON. As I recall it, about 58 percent of the electrical energy made available to the Southwest area is produced by fuel-burning plants. I do not know, but I would be of the opinion that probably 75 percent of the fuel-burning plants use oil.

Mr. WELCH. In what particular section of the country?

Mr. LARSON. In the Southwest. That is southern California, all of Arizona, and the southern tip of Nevada.

Mr. WELCH. Have you any idea how many barrels of oil are being used in the generation or development of electric energy?

Mr. LARSON. Offhand I do not have that figure, Congressman.

Mr. WELCH. I was wondering what is going to happen when our oil supply is exhausted.

According to the best figures available California's oil supply, at the rate we are using it, will not last 10 years.

Mr. POULSON. I think some of the fields change later.

I just want to say now, Mr. Welch, that I am not opposing the power project of this to be used for the power for the people in Arizona and California and other places. The main thing that I am objecting to is that they are taking water from the river, using it for irrigation, which is water which we claim belongs to California in great portion. Naturally, they admit throughout their reports and contentions that there is a dispute. It is a dispute that cannot be settled by the Department or by the Bureau of Reclamation.

I agree with you that there is a power shortage throughout the country, and we should be utilizing that power.

However, because of that necessity, because there is a shortage, one which we will all admit and which we all realize, and we know we should utilize all the power we have because we are going to use our oil up and all these things, because of that Arizona is attempting to take advantage of the crucial situation and wants to put over that project which everybody is in accord with but, at the same time, to take this water out of the river and irrigate this land, these 4,000 acres over in Arizona.

Of course, that means that that becomes the big bone of contention.

When you come to this other subject here, it takes one-third of the power, Mr. Welch, one-third of the power that is developed in that project to just pump the water and take it over there and deliver it. There is one-third of the power. If you put a price on that, how much would it amount to?

Mr. MURDOCK. Just one moment before that is answered. I would like to ask Mr. Poulson a question.

You are in favor of the building of the Bridge Canyon Dam and other dams to produce power, then, as power dams?

Mr. POULSON. I am in favor of utilizing the power of that great Colorado River.

Mr. MURDOCK. Of course, there will be other sites and other dams to be built, also. You make it clear for the record, then, that the Southwest needs the power, and to save our fuel, as Mr. Welch indicates, we ought to build these dams; so that you are unqualifiedly in favor of building the Bridge Canyon Dam?

Mr. POULSON. I said I am in favor of building hydroelectric dams on the great Colorado River. Now, I am not going to allow you, Mr. Chairman, to put me down on any one particular spot, any one

particular site, which you will attempt to use to say that I am for the Central Arizona project.

Mr. MURDOCK. I did not ask you that.

Mr. POULSON. I am for the full development of all of the sources of development of the hydroelectric power on the Columbia River and the Colorado River and all places. We have to conserve our natural resources. I am for that.

Mr. MURDOCK. We are speaking now about the Colorado River. You are in favor of building dams and producing hydroelectric power along the Colorado River?

Mr. POULSON. Yes.

Mr. MURDOCK. Which would, of course, include the Bridge Canyon Dam.

Mr. WELCH. May I ask a question, Mr. Chairman?

Mr. MURDOCK. Yes, Mr. Welch. However, Mr. Poulson has the floor.

Mr. WELCH. Will you yield to me, Mr. Poulson?

Mr. POULSON. Surely.

Mr. WELCH. Of course, hydroelectric power is very important to our national security and our peacetime economy.

Mr. Larson, are you in a position to tell the committee what the potential hydroelectric power possibilites are in that section of the Southwest described by you?

Mr. LARSON. In general I can, as far as the Colorado River is concerned.

Mr. WELCH. Do you have to confine it to the Colorado River?

Mr. LARSON. I am not familiar with all the other possibilities. However, I can say that the other hydro potentialities are rather minor. In that connection, the estimated firm output at Bridge Canyon is approximately 4½ billion kilowatt-hours. At Glen Canyon it would be about the same. At Marble Canyon, Kanab Creek development, the output would be approximately 7,000,000,000 kilowatt-hours.

Mr. WELCH. That is hydroelectric power?

Mr. LARSON. That is hydroelectric on the main Colorado River that could be marketed in the lower basin.

Mr. WELCH. If the potential power development in that section of the country were brought to its maximum use, how much oil would be saved as a result?

Mr. LARSON. Possibly 32,000,000 barrels, annually.

Mr. WELCH. 32,000,000 barrels, annually?

Mr. LARSON. Yes, sir.

Mr. POULSON. Mr. Welch, I am very, very happy that you brought that question up.

Will you yield to me at this time?

Mr. WELCH. I did not bring the question up except to bring out the imperative necessity of conservation of the Nation's natural resources.

Mr. POULSON. I think that is a very, very potent question and a very important one.

Mr. WELCH. I brought the question up with regard to oil.

Mr. POULSON. It is a good question.

Mr. WELCH. I wanted to develop the fact that every barrel of oil taken from the earth is gone forever, whereas hydroelectric power will last forever, or as long as the streams flow, the rains fall, and the snows melt.

Mr. MURDOCK. I am glad to hear you state that again and again. We understand and appreciate your attitude, and I agree with it absolutely. I think many others do on the committee, but you cannot overemphasize it, Mr. Welch.

Mr. POULSON. Now, if I have the floor I would like to finish my questions.

On this basis that we are operating now, two-thirds of the power, approximately, is paying for the project, is that right, in round terms?

Mr. LARSON. I would say it is assisting to pay for it. You also collect from the irrigators.

Mr. POULSON. All right. That would be about how many millions?

Mr. LARSON. That you collect from the sale of power?

Mr. POULSON. Over the 70-year period?

Mr. LARSON. Annually, or over the period?

Mr. POULSON. Over the period.

Mr. LARSON. About $884,000,000.

Mr. POULSON. $884,000,000. That $884,000,000 is the amount received from two-thirds of the power.

Now, one-third of the power developed, which is an intangible value, you are not selling, but you are still using the one-third of that power development to promote this irrigation project. That would be another $400,000,000.

In the question that Mr. Welch brought up, 16,000,000 gallons of oil is what we are using, the equivalent of, in giving to Arizona this power to promote this development.

That is, we build a project to save 32,000,000 barrels of oil a year. We are still using it. We are not saving it, because we are saving it in the oil, but in dollars and in the intangible value we are turning around and giving it to Arizona, because one-third of that, which is one-half of the two-thirds, is $400,000,000, which you have not included in this, which is the value of that power, except for the maintenance and operation.

That is the value of the power which could be sold, which is going to Arizona, and that is not included.

Mr. WELCH. It should be remembered, however, that water used for the development of hydroelectric power is not necessarily wasted.

Mr. POULSON. Yes; I appreciate that, Mr. Welch, but they cannot still sell that one-third of the power. If they did, they would get for the Government about $400,000,000 for one-third of the power. They are giving that to Arizona.

Mr. LARSON. Congressman, let us look at it from that approach. At the present time Hoover energy is being delivered into southern California for approximately 3¼ mills.

I showed you from the costs here that it runs up as high as 8.75 mills to produce power now. So, on your basis of analysis you could say at the present time the value of 5 mills per kilowatt-hour of Hoover energy is pouring into southern California. At the present time they are passing almost 5,000,000,000 kilowatt-hours into that area. You then multiply that 5 by 5, and there is $25,000,000 annually that is pouring in.

You might say that is going in to subsidize manufacturing now.

Mr. POULSON. We could reduce that price down, and even take the same price you are figuring, but there are still millions of dollars being given to Arizona on that basis.

Mr. LARSON. Let me follow this just a little further, Congressman. Under the Reclamation Act we use power to assist in developing the water resources. In other words, it makes these irrigation projects possible. That is a part of the Reclamation Act.

In any of these projects where power is available, part of that power is used for project pumping. The sale of the power, the revenue from the sale of the energy, is used to assist irrigation.

Now, your question, as I interpret it, was to the effect that part of this power is being tied up for the benefit of irrigation. This very committee authorized a project yesterday that had two alternatives. One is a gravity canal and the other one with pumping plants.

Mr. POULSON. And that cost $2 something per acre, as compared to what here?

Mr. LARSON. All of the costs are not included. The pumping plant and main canal——

Mr. POULSON. But one of your men made a misstatement then, because he gave us the figures of what it would cost.

Mr. LARSON. To the canal siding, Congressman. There is nothing in that bill that covers distribution or the drainage system.

Mr. POULSON. Then do you mean to say it is not complete?

Mr. LARSON. Let me finish my statement.

Mr. POULSON. You are admitting that you have come before the committee and asked for something on which you have not shown the whole picture.

Mr. LARSON. I say we have shown the whole picture.

Mr. POULSON. I mean about that bill yesterday. I am speaking about that bill now.

Mr. LARSON. What they gave you was correct. If you stop and say that the sale price of water at the canal siding is a certain price, that is correct.

Under this particular project I would like to point out the difference. We have figured the cost of this water up to each individual's farm. Not only the distribution system is added in here, but a drainage system that will have to be built some time over a period of 50 years.

In other words, the point I want to make, Congressman, is that we have included every item in here and when you compare the sale price of water under that project and the sale price under this, the price under the project you authorized yesterday is at the canal siding. The cost for water under this project is delivered to the individual's headgate. There is quite a difference.

Mr. POULSON. How much difference is there? This bill has not been passed yet. I would like to find out, if you have these things. You are supposed to come here from the standpoint of giving the true facts to the committee, instead of as a salesman's game of just giving us the salable factors and not coming up with the whole story. You are telling us that you did not give the whole story yesterday.

Mr. LARSON. The true facts are given. Do you want the cost of the water at the canal siding? Do you want it to the individual farm? How do you want it?

Mr. POULSON. What is the difference in the price? Make a comparison between what it costs to the farmer in the project we authorized yesterday and what it is costing the farmer in this project.

Mr. LARSON. I am not familiar with the details of that project.

Mr. POULSON. If you are going to make a comparison you should be familiar all the way through, I think.

Now, you brought up the Hoover Dam or the Boulder Canyon project. Since you started a comparison, let us compare the cost of the Boulder Canyon project with the cost of this project. We are starting to make comparisons of what they sell the power for. That was sold on the basis of what they paid in cost at the time. Let us give the committee the comparison in cost.

Mr. LARSON. The comparison in cost naturally is much higher, as I show on the indices.

Mr. POULSON. Tell us how much.

Mr. LARSON. The cost of Boulder was about $160,000,000.

Mr. POULSON. And this is around $800,000,000. Are you getting four times as much for your power? No.

Mr. LARSON. The cost of the same type of construction now is about 2½ times what it was at the time Boulder was constructed.

Mr. POULON. But you are not getting four times as much for your power, are you?

Mr. LARSON. No.

Mr. POULSON. You started comparing them. Let us have the whole picture of the comparison. You have come back to this comparison. From the standpoint of the Government is it not true that the Government will pay out, which you have attempted to take into your consideration, $724,000,000 in interest, together with the money to finance this project? We have to pay interest on all the money we get, is that not true, in round terms?

Mr. LARSON. Pay how much?

Mr. POULSON. Around $724,000,000. That is the amount of interest that the Government pays. The Government has to pay on the money which they put up to finance this project, is that not right?

Mr. LARSON. On a 2-percent basis it would amount to about $740,000,000.

Mr. POULSON. $740,000.000. Well, I missed it $16,000,000.

You also made a statement in the committee the other day that the cost would probably be a benefit in the future years, from the prices of construction, and so forth, if they go down. Is that right? You made a statement like that to Mr. Engle?

Mr. LARSON. That is correct.

Mr. POULSON. I thought when they started out on these projects, the big ones, that they made contracts with the contractors, and that it was a fixed fee. I did not know that you could get contractors to enter into contracts on that basis, where they take a chance if it goes up, and they will give you the benefit if the prices go down. You generally have to contract years ahead for these projects, do you not?

Mr. LARSON. That may be true, provided——

Mr. POULSON. Is it true?

Mr. LARSON. Only this way: Provided you awarded contracts for every item in the project. However, the construction period for a project of this kind would spread over a period of at least 10 or 15 years. Many of the contracts would not be let for several years.

For example, under an aqueduct, probably just a short section would be let as one contract. Another section would be let as another contract. So you take the construction period of 10 or 15 or 20 years, whatever it might be, and you would realize the benefit of a decrease in construction costs.

Mr. POULSON. Since you are saying that we are going to have lower prices, maybe, and that in the future you may get the benefit of that, let us give that further consideration. You are talking from the standpoint of what it is going to cost you, and you are giving a ray of hope.

Following that line of thinking, I ask you to consider all the possibilities. When you show the benefits by establishing prices under our high level, as you have shown here on page 36 of your report, have you taken into consideration everything? You have the irrigation benefits of $25,000,000, which subject has been thoroughly discussed between you and Mr. Engle, where he brought out the fact that the Department of Agriculture criticized your contention that the benefits should be determined by taking the gross amount that the farmer receives, because they state in their report specifically that the Department of Agriculture questions whether the benefits actually exceed costs. It is a question, as on numerous other occasions, in commenting on the proposed reclamation projects, of the use of gross rather than net crop return method of computing benefits.

That goes to show that there is a serious question by highly responsible authorities in our Government as to whether the benefits can be taken on a gross method or on a net method. You have taken the one that is favorable to your cause, by taking the gross method.

Mr. LARSON. Congressman, I disagree with that.

Mr. POULSON. Pardon me. I will finish this. You have taken that contention that the gross increase is of benefit, and then you add the power. Then you have taken silt control, which is not included, as I understand it, in the set-up for feasibility. In figuring the feasible program that is not a part of the cost. Then you have taken recreation. As Mr. Engle very ably brought out, how can you figure that people are going to have $1,482,000 extra to spend on recreation?

In other words, if they are going to spend it, are they not taking it out of some other park or some other locality? We do have just so much, you know.

However, you have taken a figure to show that it is going to benefit, by $1,482,000, and you have taken salinity control, which is also an item which is not to be considered in feasibility.

You have taken these hypothetical intangible figures to show the benefits. Then after you have reached in the air and got everything that you could imagine, you still only show that for every dollar there is only a return of $1.59, and you come back to show us that. A businessman would not approach it on a basis like that, with the uncertainties, because the expenses are fixed. They are just like an overhead. You have them fixed, such as operation and maintenance, amortization of the project, interest, and the like. Those are fixed items. They are going to remain the same, but here you have taken the advantage of a boom time and have used those figures for the other side.

On the basis of just the 1.59 to 1, in itself, that is something that should raise the eyebrows of most of the Congressmen, when they want to put in $800,000,000 with the right to authorize another $400,000,000.

In other words, a project that will cost one-billion-two-hundred-million-and-some-odd dollars is quite a large project.

Now, I want to know if you have any ideas of backing up the contentions other than those which you gave Mr. Engle when he ably asked you those questions?

Mr. LARSON. First, I would like to say, Congressman, that the statement you made that we selected the method which shows the greatest benefits, I thoroughly disagree with. I will tell you why.

At the time we worked on this particular project—you will recall that the report was completed in 1947—the best method we had of determining the benefits from irrigation was the gross crop income. That is why we used it.

Since that time progress has been made in developing a method of determining benefits that is, net benefits. On the basis of determining net benefits of projects the increase over gross crop income is about 140 percent.

Now, if that same formula was applied to this project the irrigation benefits would be much higher than we have shown here.

Secondly, the benefit from power, as we have shown, is the sale price of power.

Mr. POULSON. I would like to have you go into detail. You are saying that you can do it. How can you tell what these costs to these farmers are going to be? What kind of chart do you have? Let us see your working papers, analyzing how you are going to get this additional revenue, and how they are going to make their net income. Do you have those figures?

Mr. LARSON. Yes; it is on this chart.

Mr. POULSON. How much of it is hypothetical? How much of it is based on fact? It is a theory, is it not? Is it not a theory?

Mr. LARSON. That gross crop income is a measure of the irrigation benefit?

Mr. POULSON. Are not all these items you have here a theory?

Mr. LARSON. No, sir.

Mr. POULSON. Do you mean to say that these are factual? Do you mean to say that you can show the amount of $1,482,000 more that the people are going to spend? Do you mean that you can show that in factual basis?

Mr. LARSON. I do not say that it is theory. That particular item you have pointed out is the benefits as determined by the National Park Service. The irrigation benefits we determined.

Mr. POULSON. By the National Park Service?

Mr. LARSON. That is right.

Mr. POULSON. Did they say that people in the country are going to spend $1,482,000 more than they spent heretofore?

Mr. LARSON. They say, from a national standpoint the recreational facilities would be worth that. That is the benefit from a national standpoint.

Mr. POULSON. That is their theory now? How do they arrive at that?

Mr. LARSON. I am not familiar with the details of computing those benefits.

Mr. POULSON. Then it is still a hypothetical thing. They have not any factual data. You know it is going to cost $26,000,000. That you know, do you not?

Mr. LARSON. That is correct, as near as we can estimate it.

Mr. POULSON. That is right. However, that is based on actual cost. This other is on a theory. This other is building up a hypothetical theory where you figure that if people do this tomorrow and do not do that the next day, and things like that, that is what will happen; is that not right?

Mr. LARSON. In my opinion the benefit to the Nation is much greater than we have shown.

For example, what is the benefit from power to the Nation? Is it the value of the sale price of that power?

Mr. POULSON. We are not arguing about power. I am for the power. I am talking about the benefits to the farmers.

Mr. LARSON. That is right, and you were referring to this 1.59 to 1. When we spend $1 to get $1.59 back, you add them all in to get $1.59. You talk about one, and I talk about another, but they all add up to $1.59.

Mr. POULSON. If you begin to take off some of these, that $1.59 will go down below $1. When you subtract that always cuts it down.

Mr. LARSON. That is right. If you add to the other it goes up.

Mr. POULSON. That is right, of course. You are taking the power. The power is for the whole country. You are speaking about Arizona. The power could be sold and it would be still greater. This is the project which takes the power out.

Mr. LARSON. Assume that the power was used in Arizona.

Mr. POULSON. Well, that would not make any difference that way.

Mr. LARSON. In other words, the benefit would still be there. It does not make any difference where it is used. What is the value, for example, of municipal water? I think you would agree that the sale of municipal water in the vicinity of Tucson, for example, would exceed 15 cents a thousand gallons, as far as benefit is concerned.

Mr. POULSON. It is pretty dry out there. I know that.

Mr. ENGLE. Will the gentleman yield to me?

Mr. POULSON. Yes.

Mr. ENGLE. Mr. Larson, has it not been the practice to consider recreational benefits as the cost equal to the benefits, and to have the additional benefits zero, in other projects?

Mr. LARSON. The cost of recreational facilities equals zero?

Mr. ENGLE. Equals the benefits, and therefore you do not add or subtract either way.

Mr. LARSON. I do not see how you could figure it that way.

Mr. POULSON. He very ably brought out the last time that the people do not have that much money to spend.

Mr. ENGLE. I do not see why you do not make the recreation benefits $2,800,000 instead of $1,400,000, if it is an arbitrary figure that you reach up and grab out of the sky.

Mr. LARSON. I do not think the Park Service grabbed it out of the sky.

Mr. ENGLE. If you folks are taking the responsibility for justifying this project, you ought to know how it is figured out and how you arrive at the figures. I am very much disturbed about that whole proposition, because it is my view that if these nonreimbursables are spread out far enough, you can cover anything. We have a bill now that is waiting over before the Rules Committee on that subject, and if these nonreimbursables are as elastic as they appear to be, there is not any project that cannot be justified by putting enough nonreimbursables in.

Mr. D'EWART. Will you yield to me?

Mr. POULSON. Yes.

Mr. D'EWART. That is the point we tried to make on H. R. 1770, a method of figuring what should be the items of nonreimbursables.

I made the point in the committee that the amount charged as nonreimbursables should not exceed the total amount invested by the Gov-

ernment for that purpose. In other words, the amount of nonreimbursable items for recreation should not be capitalized in the public benefit, but should be capitalized only as to the amount it cost the Treasury of the United States.

I still think that is a sound basis of nonreimbursability of an item in any project. That is not referring to this particular project.

Mr. ENGLE. I am not so sure that is correct.

Mr. D'EWART. Mr. Engle did not agree in the committee. I will admit that.

Mr. ENGLE. Here is my point: Let us take transportation, for instance. We put transportation in and charge off a certain amount of benefit as nonreimbursable, as a transportation benefit to the Nation.

You could say that the transportation benefit is the additional cost where you put in a road across the top of the dam, or you could say that the transportation benefit is the cost that would be required to build a bridge in the same place if the dam were not built. Either one of those extremes seems to me to be the wrong way to look at it.

However, I do agree with the gentleman from Montana that in figuring these nonreimbursables we are going to get into serious trouble in our reclamation program in the West unless we can get the thing down to a more definite basis, and have the witnesses for the Reclamation Bureau come in here without saying, "Well, somebody else figured it, and therefore, it must be right."

Mr. MURDOCK. We are going to have to adjourn in just a few minutes. I believe that the witness has not had a chance to answer your questions.

Mr. D'EWART. I would like to make one more point.

This very thing is discussed in the Hoover report, and it brings out seven different methods of figuring nonreimbursable items, and it is worth reading.

Mr. MARSHALL. Will the gentleman yield? You are talking about a figure of $1,000,000 something, approximately?

Mr. POULSON. We just used that as an example, going on to show some of the points.

Mr. MARSHALL. If that were a zero in this particular project, how much would that change this $1.59.

Mr. POULSON. That is true, also, but we could go on to these other items. We have salinity control. They start showing figures that are going to be a benefit, and they are hypothetical.

We realize that there can be some benefits. Maybe they consider it a benefit that the people over in that district spend $350 for a vacation and do not pay it on some debt which they have. That probably is considered a benefit, to their way of thinking, but it is hypothetical.

Mr. MURDOCK. It appears to the Chair that there have been a good many questions asked that really were not questions, and furthermore the witness has had little time to answer those asked.

I will ask the witness: Do you recall a direct question that you have an answer for which you have not been able to give?

Mr. LARSON. Well, one question in connection with Congressman Poulson's questioning, with regard to the recreational benefits. If, for example, you eliminate the item of nonreimbursable benefit to recreation, that would mean, that power would have to sell for 4.8 mills instead of 4.65 mills. In other words, it amounts to less than two-tenths of a mill. It is about fifteen one-hundredths mills difference in the power rate.

Mr. ENGLE. Mr. Larson, you have given some benefits for salinity control.

Does this project give you any salinity control which is not normal to the ordinary flushing of the land, and, therefore, incident, really, to the project in its maintenance and operation?

Mr. LARSON. The silt-control benefit for Buttes Dam and any of the developments on the Gila River were computed by the Corps of Engineers and through an agreement with them, they have permitted us to use their figure and the plan of development in that particular area.

I do not know as we have questioned their figure of determining that silt benefit any more than we questioned the method used by the Park Service in determining the recreational benefit.

Now, with regard to the silt benefit on the Colorado River, we determined the cost that would be involved to provide a silt-retention reservoir and to withhold the silt out of Lake Mead, the most economical development. On the basis of the cost of that structure over this repayment period to withhold silt for that period we determined the benefit on an acre-foot basis.

Mr. ENGLE. I know, but my recollection is that the Bureau of the Budget, in its statement, indicated that these dams would silt up before the end of the life of the project, and you would have to have some other silt control methods, either in the form of a dam at the other end of the canyon, or something else, in some 40 years; is that right?

Mr. LARSON. No. In my opinion the developments that we have set up in this project will not silt up within the repayment period.

Mr. ENGLE. You recall the statement in the Bureau of the Budget's message, do you not?

Mr. LARSON. Yes. I think that it was based upon rather hypothetical conditions. For example, I think we have fully shown in our report that there is a demand for all the potential power on the Colorado River in the lower basin within a very short period of time.

On this basis, we have assumed that Glen Canyon would go in within 15 years after Bridge Canyon is constructed. There, again, I think that period will be reduced because of the great power demand in the Southwest.

In connection with Coconino and Bluff, those silt reservoirs, as we have them set up in our report, will withhold silt for a considerably longer period than the 70-year repayment period that we have considered in the project.

Mr. ENGLE. Well, it may be that the Glen Canyon project would control the silt. That adds another couple of hundred million dollars to this project, does it not?

Mr. LARSON. I beg your pardon.

Mr. ENGLE. That adds more money to the project in 15 years, does it not? In other words, if the Glen Canyon project is an absolute essential to this project it should be considered in it and authorized at the same time, should it not?

Mr. LARSON. Glen Canyon is considered as an independent development but, Congressman, you will note from the features that we have set up that after Glen Canyon goes in it will be benefited by Bluff Dam, which is included as a cost to this project to the extent of $29,628,000. Glen Canyon will then receive the full benefit of that development which is charged as a cost to this project.

Mr. MURDOCK. Mr. Poulson, had you concluded your questioning?

Mr. POULSON. Yes. I think we are supposed to leave.

Mr. MURDOCK. We have a few more minutes. Did you have any other questions?

Mr. POULSON. No.

Mr. MURDOCK. Has any member of the committee any question to ask of Mr. Larson?

Mr. D'EWART. I would like to ask a question.

In that 8-mill rate you reflected as the average rate for the Southwest area, did that include all the costs at the bus bar, or was it delivered to the customer?

Mr. LARSON. You mean the cost by oil development?

Mr. D'EWART. You said the average rate of the sale of electric power in that area, where oil was used, was from 7 to 8 mills.

Mr. LARSON. That is the average cost of new developments at the plant.

Mr. D'EWART. At the plant?

Mr. LARSON. That is right.

Mr. D'EWART. Then they still have transmission?

Mr. LARSON. Of course, on some of the older developments if their efficiency is reasonably high and the construction costs were low it would be a little less than that.

Mr. D'EWART. I was not asking that in connection with this. I was just interested in the subject.

Then they still have the cost of transmission lines, distribution, and so on, on top of that. They reflect all of the costs, including taxes, up to the bus bar?

Mr. LARSON. That is correct.

Mr. MURDOCK. It is highly important that the members who are to appear before the Rules Committee at 11 o'clock do so, but we did want to hold a full committee meeting meanwhile.

Mr. D'EWART. What is before the Rules Committee?

Mr. MURDOCK. We are asking for a rule on H. R. 1770.

Were there any other questions that the members wanted to ask Mr. Larson?

Mr. REGAN. I would like to know, Mr. Larson, what the over-all cost of these nonreimbursable items amount to.

Mr. LARSON. Approximately 10 percent of the total.

Mr. REGAN. About 10 percent of the total?

Mr. D'EWART. That would be about $200,000,000.

Mr. LARSON. Would you like it in dollars?

Mr. REGAN. To save time, just the over-all amount.

Mr. LARSON. Ten percent of the total. Flood control, eight-tenths of a percent; silt control, 4 percent; recreation, 4 percent; fish and wildlife, ½ percent; salinity control, seven-tenths percent.

Mr. REGAN. It amounts to about 10 percent of the total?

Mr. LARSON. About 10 percent of the total.

Mr. MURDOCK. Shall we ask Mr. Larson to hold himself in readiness for our next meeting?

(No response.)

Mr. D'EWART. I might say, Mr. Chairman, I believe there are no more sessions of Congress this week after today, if you are interested.

Mr. MURDOCK. This subcommittee stands adjourned until 9:30 o'clock tomorrow morning. We will meet in the main committee room at that time. I urge a full attendance.

(Thereupon, at 10:50 a. m., Thursday, May 5, 1949, an adjournment was taken until 9:30 a. m., Friday, May 6, 1949.)

THE CENTRAL ARIZONA PROJECT

FRIDAY, MAY 6, 1949

HOUSE OF REPRESENTATIVES,
SUBCOMMITTEE ON IRRIGATION AND RECLAMATION OF THE
COMMITTEE ON PUBLIC LANDS,
Washington, D. C.

The subcommittee met, pursuant to adjournment, at 9:30 a. m., in the committee room of the House Committee on Public Lands, the Honorable John R. Murdock (chairman of the subcommittee), presiding.

Mr. MURDOCK. The subcommittee will please come to order.

We will proceed with our further hearings on H. R. 934. We had Mr. Larson before us yesterday for further questioning. I thought at the time of the adjournment yesterday that probably we had asked him about all of the questions necessary, or had made comments in regard to his statement, by the members, and I told Mr. Larson that I felt that he might be dismissed; but he has stayed over.

Mr. Larson, would you step forward, please. Maybe we have some other questions to ask you, since you are here.

STATEMENT OF V. E. LARSON, ASSISTANT REGIONAL PLANNING ENGINEER, REGION III, BUREAU OF RECLAMATION, DEPARTMENT OF THE INTERIOR—Resumed

Mr. LARSON. Yes, sir.

Mr. MURDOCK. Governor Miles, have you any further questions?

Mr. MILES. No, sir; I do not believe I do. He made such a good witness I would not want to question him.

Mr. MURDOCK. He is an engineer. Mr. Aspinall?

Mr. ASPINALL. No questions.

Mr. MURDOCK. I think, Mr. Larson, that I will not quiz you further.

You made the study under the direction of your chief, did you not, and on the general proposal of bringing water into central Arizona?

Mr. LARSON. That is correct.

Mr. MURDOCK. According to your studies, then, this is an engineeringly feasible project?

Mr. LARSON. Yes, sir; it is.

Mr. MURDOCK. That is the purport of your testimony. As I said to you the other day in the beginning, you have gone minutely into this matter showing the effects upon not only the State of Arizona, but the adjoining States involved. I feel that it is a very comprehensive report.

I wish to thank you, and to compliment you upon your statement. You may be excused.

Mr. LARSON. Thank you, sir.

Mr. MURDOCK. Our next witness is also an engineering witness, but before calling him I want to call attention to a few messages that I have just received.

One is a telegram from Phoenix signed by Charles H. Dunning, the director of the Department of Mineral Resources of Arizona.

This is what Director Dunning says:

> Statistical authorities report Arizona paid $83,000,000 in Federal taxes in 1948 besides other special Federal taxes. This was accomplished only by cashing in on our capital assets such as underground water. Such selling of capital assets cannot be maintained. And without Colorado water our contribution to the Nation will soon drop to less than half the above. That difference would pay the cost of the project in comparatively few years.
>
> Interpreting these facts into mining angles, which is where our Department is concerned, our mines now pay one-third of State taxes and greatest percentage Federal taxes. If our agricultural earnings are not maintained so much tax burden will accrue to mines that many marginal producers will be forced to close and a chain reaction of curtailment will be started.

That is signed by Charles H. Dunning, director, Department of Mineral Resources, Phoenix, Ariz.

My mail, as well as telegrams, brings me interesting documents. I have one which I am not going to read or put in the record, but I am merely going to refer to it.

This is a document from Los Angeles and in it is a form letter, a suggested letter to be sent to eastern businessmen and industrialists which they may sign and send to their Congressmen. We are all acquainted with that technique. This form letter has some very questionable statements purporting to be facts.

I was greatly pleased with a letter that I received a few days ago, however, which I may provide for this record. It shows the reaction of an eastern business executive quite unfavorable to this propaganda line.

It is a letter from President Maytag of the Maytag Co., one of our well-known American companies. In this letter President Maytag said he had just received a communication from Bullocks of Los Angeles and he indicated the nature of the communication concerning this water dispute.

President Maytag also indicated his unfavorable reply to the Los Angeles correspondence.

I merely allude to that to give the committee some idea of the correspondence that I am receiving. I presume other members of the committee also receive such correspondence.

Once more, before we call the next witness, Mr. Welch calls my attention to the fact that the Public Lands Committee has asked for a rule on H. R. 1770, and the rule has not yet been granted. He and I have twice appeared before the Rules Committee. I was hoping that the rule might be granted us on H. R. 1770 before this time, but I want to say to those members of the Public Lands Committee present that it would be well for us to consult with individual members of the Rules Committee in regard to that important bill.

Mr. Welch says that we do not have a report from the Bureau of the Budget and that that is one of the things that may be holding it up. We do have a favorable report on the bill, and did have it before we reported the bill out from the Department, with the statement that the report had been called for with dispatch and that time had not permitted it to clear through the Budget.

If Mr. Will of the Bureau of Reclamation, who is here, will take note of that, we will see if we can not hurry that matter along, also.

Our next witness is Mr. Lane, also a consulting engineer.

Mr. Lane, will you give your name to the reporter, and identify yourself for the record?

STATEMENT OF W. W. LANE, CONSULTING ENGINEER, PHOENIX, ARIZ.

Mr. LANE. My name is W. W. Lane. I am a consulting engineer from Phoenix, Ariz. I have been engaged in irrigation work in Arizona and the Southwest for the past 30 years, and for 15 years was associated with the development and operation of an irrigation district in the Central Valley near Phoenix, comprising 35,000 acres.

The purpose of my appearance before this committee is to present data with respect to the irrigation development in central Arizona, and its need for an additional supply if the civilization now existing there is to be fully sustained.

Central Arizona has become a large agricultural empire founded upon irrigation, and playing a considerable part in the economy of the Southwest.

Remains of irrigation facilities found by the early settlers, and those yet remaining, were and are evidence of an extensive prehistoric agricultural development. This prehistoric development was probably abandoned because of prolonged droughts and its effects.

With the coming of the white man into the Southwest, irrigation of lands was revived by small earth and brush dam diversions from the streams, and canals to the lowlands along the rivers. This, likewise, proved uncertain because in years of floods their diversion works washed out, and in dry years the available water in the rivers was insufficient.

With the turn of the present century and following the passage of the National Reclamation Act in 1902, the Roosevelt Dam on the Salt River was constructed. Subsequently, other dams were constructed, until now the waters of all of the principal streams in central Arizona are largely in use.

The land is highly productive with an adequate irrigation supply, but without such a supply it is totally nonproductive. It is valley land, of good soil less sandy than found in much of the Southwest. For this reason it holds to a high degree the moisture applied for the benefit of the plants. For full production it requires approximately 4 acre-feet applied to the land. To obtain this amount at the land from river supply it has been found necessary to divert approximately 5.7 acre-feet per year per acre, and for ground water pumping to pump

an average of 4.7 acre-feet at the well. (See table B–5, Bureau of Reclamation Report, central Arizona project.)

It is of interest to note that major irrigation projects, or modern irrigation as we now know it, is young, all of this century. When the Salt River project was started in the early days of the Bureau of Reclamation it was estimated that the annual per-acre requirement at the farm was 3 acre-feet for the general farming then prevailing and the project area was fixed accordingly. This was based upon general farming as was the practice in that area. Due, however, to the climatic conditions permitting long growing seasons and to the highly fertile soils in this area, it has been found to be particularly adapted to specialized crops and multiple crops per year. This provides fresh foods to the Nation at times they would not otherwise be available, but to do so it is now found that 4 acre-feet per acre at the farm is required to maintain such production, or one-third more water than was originally considered necessary.

The period from 1905 to 1921 was what may be termed a wet period. Before the end of this period subsurface drainage became necessary in the Salt River Valley. Also, during this period it was found that wells could be sunk almost anywhere in the alluvial filled valleys and produce large volumes of water with increasingly efficient deep well pumps. These conditions encouraged new stream storage projects, expansion of acreage under existing projects, and the progressive development of land with wells.

Following the above wet period there has been a decline in the precipitation and stream run-off within the State. Projects originally predicated upon river run-off installed wells to augment the river supply. Encouraged by the success of the early wells, landowners, without understanding the source or characteristics of underground water, and motivated only by a desire to develop their lands, installed wells progressively until at present about half of the total acres farmed in the central area is solely from pumps, and most all of the remaining land is dependent upon wells to a variable degree.

Underground water is not inexhaustible. On the contrary, such underground supply is very similar to a surface reservoir. It must have an average inflow equal to the average withdrawal to remain useful. With the progressive increased pumping that has occurred, the level of the underground water is rapidly receding, thereby increasing the depth it must be lifted, and is, in some instances, now reaching the depth that pumping can no longer be done economically and some fringe wells have gone dry. As such progressively occurs, lands must be returned to the desert from which it was reclaimed.

As a result of the development predicated upon early estimates of river water supply and belief of unlimited underground supply, 809,000 acres had been put under irrigation at the close of 1947 in Maricopa and Pinal Counties. This area includes all the land in irrigation districts though not fully irrigated because all included lands have equal water rights. From the records of the districts, companies and other official and unofficial records, the project and individual areas are estimated as follows:

TABLE 1

Maricopa County:		
Arcadia Water Co		1,550
Arlington Canal Co		4,480
Buckeye irrigation district		19,200
Broadacres, Lone Butte and Ocotilla Farms		8,175
Chandler Heights		1,290
Enterprise Canal Co		1,000
Gillespie Land & Cattle Co		20,800
Goodyear Farms and Adaman Municipal Water Co		13,450
Indian lands		7,640
Marinette Farms		9,000
Maricopa County municipal water conservation district		35,000
Peninsula, Horowitz and Champion and St. Johns irrigation district		3,730
Private pumps:		
East of Roosevelt water conservation district		5,000
North of Arizona canal		11,000
South Salt River project		16,920
West of Agua Fria River		20,600
Queen Creek area		16,080
Roosevelt irrigation district		38,000
Roosevelt water conservation district		39,500
Salt River Valley water users' project		242,000
Miscellaneous projects along lower Gila		7,950
Total		522,365
Pinal County:		
San Carlos irrigation and drainage district:		
White lands	50,000	
Indian lands	50,000	
		100,000
Queen Creek and Magma area		4,000
Electrical districts 2, 4, and 5 not included in San Carlos district		147,000
Stanfield district		35,000
Papago Indian lands		350
Total		286,351
Total Maricopa and Pinal Counties		808,716

Of the foregoing lands, the following projects have storage facilities:

TABLE 2

Salt River Valley projects, a Federal project with reservoirs on the Salt and Verde Rivers	242,000
Coolidge project, a Federal Indian Service project with a reservoir on the Gila River	100,000
Maricopa County municipal water conservation district No. 1, a municipal project, on Agua Fria River	35,000
Roosevelt water conservation district, a municipal district, with certain storage rights in Salt River system	39,500
Total having storage facilities	416,500

Other projects having stream diversions are as follows:

Buckeye irrigation project	19,200
Arlington Canal Co.	4,480
Gillespie Land & Cattle Co.	20,800
Indian lands	7,640
Enterprise Canal Co.	1,000
St. Johns irrigation district	3,730
Total	56,850
Total acres having stream diversions	473,350
Total relying entirely on wells	335,366
Total	808,716
Deducting 10 percent of the foregoing	80,872
Net irrigated lands in Maricopa and Pinal Counties	727,844

Normally up to 10 percent of farm lands are out of crops for farm building sites, roads, wastelands and so forth.

All of the foregoing projects and areas having river storage facilities and diversions also rely substantially upon wells—the amount pumped annually depending upon the annual water available from the river supply.

The 1947 Bulletin 211 of the Agricultural Experiment Station, University of Arizona, tabulates the acres actually in crop in 1947 for the foregoing areas as follows:

Maricopa County	430,145
Pinal County	195,550
Total	625,695

From the foregoing it is indicated there were 102,000 acres out of production in 1947.

Present water use: In the projects hereinbefore listed as having stream diversions, table B–1 in the Bureau of Reclamation report shows average diversions for the average 1940–44 in column (D) to be as follows:

TABLE 3

Maricopa County unit:		
Salt River project	907,200	
Roosevelt water conservation district	48,400	
Indian lands	27,800	
Total diverted at Granite Reef		984,400
Maricopa County municipal water conservation district Agua Fria River		54,200
Total		1,038,600
Rediversions or diversions from return flow:		
Arlington Canal Co	27,600	
Buckeye water conservation and drainage district	88,700	
Gillespie area	81,200	
Total diverted from return flow		197,500
Total diversions		1,236,100
Pinal County unit: San Carlos project Gila River		254,000

Bulletin 211 of the Agricultural Experiment Station, University of Arizona, above referred to, gives the acres in crop for these projects for 1947 as follows:

TABLE 4

Salt River Valley projects:		
Salt River Valley Water Users' Association	215,000	
Roosevelt water conservation district	32,000	
		247,000
Indian lands		6,700
San Carlos project:		
Gila River Indian Reservation	27,400	
San Carlos white lands	32,000	
		59,400
Other: Maricopa County municipal water conservation district		18,200
Total from Bulletin 211		331,300
Total acres in foregoing projects:		
Salt River Valley Water Users' Association	242,000	
Roosevelt water conservation district	39,500	
Indian lands	7,600	
San Carlos project	100,000	
Maricopa County municipal water conservation district	35,000	
Total	424,100	
Less 10 percent lay-out land	41,500	
Land laid out in 1947		50,400
Total	381,700	381,700

The above areas are irrigated by the initial diversions from the major streams as they enter the areas and normally almost wholly divert these streams, augmenting their supply by pumping from ground water. Their supply for 1940–44 averaged as follows:

River water (from table 3)

	Acre-feet
Salt River at Granite Reef	984,400
Agua Fria River	54,200
Gila River, for San Carlos project	254,000
Total	1,392,600
Area that can be irrigated at 5.7 acre-feet per acre—acres	227,200
Remainder of above area of 381,700 left to be supplied by pumping—acres	154,000
Pump water required at 4.7 acre-feet per acre—acre-feet	726,000

Although these projects are partially supplied from the principal streams of the Gila River system by surface diversions they would require from the underground water an average of approximately 726,000 acre-feet per year if they maintained their land in full crops each year. In some years of below average river supply, these dual source projects cannot maintain a full cropping—1947 was a year of below average river run-off.

The remaining projects as listed above in table 3 having stream diversions are in the lower valley section and generally have a fair river supply from the return flow from the lands above. They are required to pump to some extent about 100,000 acre-feet from relatively shallow depths, to stabilize their supply. Their water both from the stream and pumps is extremely salty, because it is carrying the salts from the upper lands. These waters are too salty now for many crops and is increasingly building up salts in the soil. This land must have a large quantity of fresher water, and better drainage to wash out the high saline concentration in its ground water which is now

exceeding 4,000 parts of salts per 1,000,000 parts of water, or it will be forced out of productive crops by the salts.

As shown above, there are 335,000 acres irrigated solely from pumps. Deducting 10 percent, or 33,000 acres, out for other farm use, leaves 302,000 acres. That is 4.7 acre-feet at the pump to supply 4 acre-feet at the land requires 1,420,000 acre-feet from the underground supply. The 1,420,000 plus the 726,000 acre-feet required by the projects the Salt River group, San Carlos, and Agua Fria diversions, plus the 100,000 acre-feet for the westerly projects having stream diversions, make a total of approximately 2,246,000 required from the underground and/or some other source.

A report of the United States Geological Survey entitled "Pumpage and Ground Water Levels in Arizona in 1947" by S. F. Turner and others, shows the pumpage in Maricopa and Pinal Counties for the years 1940–47 as follows:

Year	Maricopa County	Pinal County	Total
1940	943,000	372,000	1,315,000
1941	444,000	351,000	795,000
1942	1,040,000	500,000	1,540,000
1943	1,104,000	515,000	1,619,000
1944	1,017,000	530,000	1,547,000
1945	1,143,000	610,000	1,753,000
1946	1,398,800	660,000	2,058,800
1947	1,446,800	700,000	2,146,800

The year of 1941 was a fairly wet year, and the last wet year of the above period.

Safe average present water supply: Water pumped from underground must be fully recharged if it is to be depended upon for irrigation. In the report of the United States Geological Survey, entitled "Geology and Ground Water Resources of the Salt River Valley Area, Maricopa and Pinal Counties, Arizona" by McDonald, Wolcott, and Hem, issued February 4, 1947, pages 15 to 18 particularly treat with the Salt River Valley area. It summarizes the source of supply for the area as follows:

> Recharge to the aquifers of the region is derived from four main sources, listed in order of importance: (1) Irrigation and canal seepage, (2) stream flow, (3) underflow of major streams where they enter the region, and (4) rainfall.

The Pinal County area is discussed in the report of the United States Geological Survey, entitled "Ground Water Resources of Santa Cruz Basin, Arizona," pages 33 to 61. The following is quoted from page 34 of this report:

> In the Eloy area the main source of ground water is from underflow from the Avra area and from the Santa Cruz Valley. There is probably a small amount of recharge from flood losses in the small washes originating in the Sawtooth and Piccacho Mountains. It is very doubtful that seepage losses from irrigation occur in appreciable amounts.
>
> In the Maricopa area the recharge to the ground-water reservoir occurs chiefly as underflow from the Eloy area passing between the Silver Reef and Casa Grande Mountains and as underflow from the Casa Grande area passing between the Casa Grande and Sacaton Mountains. Minor amounts of underflow to the Maricopa area enter from the Santa Rosa, Vekol, and Jack Rabbit basins. Additional originating in the mountains surrounding the area, and possibly from fault springs.
>
> Recharge to the Casa Grande-Florence area is mainly from canal and irri-

gation seepage losses, from underflow of the Gila River, from seepage losses from the Gila River, and from washes originating in the Tortilla Mountains, particularly McClellan Wash.

As previously stated, underground water must have an inflow equal to its draft to enable sustained use. This sustaining inflow is generally referred to as the "safe yield."

A report has been made upon the areas of Maricopa and Pinal Counties by the United States Geological Survey, entitled "Safe Yield of Ground Water Reservoirs in the Drainage Basins of the Gila and Salt Rivers, near Phoenix, Arizona," by S. F. Turner, H. P. McDonald and R. L. Cushman—1945.

On pages 67 and 69 of this report, the safe yield for Pinal County area, inclusive of the Santa Cruz Basin, is given as 135,000 acre-feet annually. For the Maricopa County Area the foregoing report shows a tabulation on pages 6 to 15 of the computed safe yields for the years of 1935 to 1941, as given in the last column of the tabulation as being 579,000 acre-feet. The total, therefore, for the two counties, is 714,000 acre-feet.

Referring to the pumpage tabulation as given herein, it will be noted that there was 2,146,500 acre-feet pumped in 1947, or 1,432,500 acre-feet more than the foregoing estimated safe yield for the areas. Of the 2,146,500 acre-feet pumped in 1947, 700,000 acre-feet was pumped in Pinal County, and 1,446,500 was pumped in Maricopa County. But in spite of the excess pumping, many acres within these areas while classed as farmed did not have a full water supply, resulting in partial cropping and/or in lower yields. This acreage cannot be accurately estimated.

The underground supply can be drawn out in excess of its safe yield for a period of time, with lowering of its level as in a surface reservoir. But, like a surface reservoir there should be compensating periods of reduced pumping to less than the safe yield to permit the refilling.

The effect of the overpumping is clearly shown by a graph included in the United States Geological Survey report entitled "Maricopa County" by H. M. Babcock and others, as continued for 1947. The graph is entitled "Graph Showing Cumulative Net Change in Water Level and Water Pumped for Irrigation in Salt River Valley Area, Maricopa County, Arizona."

From the graph the composite lowering of underground water from 1930 through 1944 was approximately 12 feet, or an approximate average of 1 foot per year. For the 3 years of 1945 through 1947 the table lowered an additional 14 feet, or at an average rate of almost 5 feet per year, and in 1947 alone it dropped 6 feet of the 14. When the wells go dry, as some few have in the past year, or the level drops to the extent that the cost of pumping the water exceeds the ability of the land earnings to pay it, the lands must go out of operation.

Attached hereto on the last page hereof is a graph entitled "Maricopa County Water Use, Source, and Effect." This graph shows the relation between the amount of water diverted from storage reservoirs, and the amount of water pumped. Also, the relation between the amount of water pumped, and the safe yield from underground supply as estimated by the United States Geological Survey. Interposed on the upper part of the graph is a copy of the graph from the United States Geological Survey, as mentioned in the preceding paragraph, showing the change in the underground water level during

the same period. The graph so interposed is not directly correlated to the pumping, but does depict in a general way the relation between the variation in pumping and the effect upon the underground supply.

Lands out of crop, 1947: As previously shown herein, for the projects having storage facilities and pumps, there were 50,400 acres not cropped in 1947 after deducing for normal lay-outs of lands.

Of the 56,850 acres shown herein in projects, or areas having some stream diversions but no storage, less 10 percent leaves 51,000 net acres.

Mr. MURDOCK. May I ask you a question there, Mr. Lane?

Mr. LANE. Yes, sir.

Mr. MURDOCK. That information on page 13 applies to Pinal County, does it?

Mr. LANE. The tabulation?

Mr. MURDOCK. The information applies to Pinal County, where it dropped 1 foot per year for 12 years, and then 14 feet in 3 years? That is in Pinal County, is it not?

Mr. LANE. No, that is in Maricopa County. They did not have a chart worked up on Pinal County. That particular chart is only for Maricopa County.

The other chart I referred to, which includes the pumping and diversions, which is immediately below the chart first referred to, does include both Maricopa and Pinal Counties.

Mr. MURDOCK. That increase in the dropping of the underground water is almost in a geometric ratio, is it not?

Mr. LANE. If you will refer to that chart on the back of the Statement, Congressman, you get a pretty good idea of the direct relationship.

Mr. MURDOCK. Please go right ahead.

Mr. LANE. The foregoing mentioned Bulletin No. 211 of the University of Arizona, shows 37,100 acres in crops in 1947. Deducting the 37,000 acres from the 51,000 indicates approximately 14,000 acres were out of production.

Of the 335,000 acres listed herein as in areas supplied from wells only, 302,000 acres should be in crops with a normal 10 percent of idle lands, but the foregoing Bulletin No. 211 shows 273,965 acres in crops in 1947, indicating 33,000 acres of this land could not be farmed in 1947. This added to the 50,400 acres out of crop in the storage projects and the 14,000 in the lower river diversion projects would indicate 97,000 acres could not be farmed in 1947, for lack of water.

Upper Gila River Basins: The Bureau of Reclamation's report entitled "Central Arizona Project" appendixes 1947, page B–5, shows the average acres cultivated in the Upper Gila Valleys in Arizona and New Mexico as 45,640 acres. As these valleys are narrow and have been farmed for years, this is probably the maximum average for these areas.

On the San Pedro River Bulletin No. 211 of the University of Arizona, 1947, it shows 2,100 acres of land to be irrigated, or a total of 47,700 acres in the Upper Gila and San Pedro Basins.

These lands require some less water diversions per acre because of higher elevations, with less evaporation and with more rainfall. It is estimated the irrigation water consumed per acre is 2.74 acre-feet per year. This would require 5.2 acre-feet diverted from stream flow and 4 acre-feet at the pump to serve this land.

The surface water supply for the upper Gila Valleys as given by the Bureau of Reclamation's report, Central Arizona Project, appendixes, page B–8, is 182,000 acre-feet annually; and for the lands on the San Pedro River as 4,500 acre-feet annually; or a total of 186,500. The safe annual yield of underground water is given in the foregoing report, page B–84, for the upper Gila Valleys as 32,400 acre-feet, and for the San Pedro Valleys as 2,200 acre-feet, or 34,600 acre-feet. The acres given for these valleys are net, and no further deduction is made.

One of the major difficulties in these areas is the irregularity of the stream flows, there being no regulation of the streams as yet. When water is available in quantity, the farmers divert excessively in the endeavor to build up soil storage for the crops. This is effective to a degree but results in a higher diversion record than is usable for crop consumption, and during the drier periods of the year there is a shortage for the growing crops.

The summation of the total net acres in the central Arizona project is as follows:

Maricopa and Pinal Counties	728,000
Upper Gila and San Pedro Valleys	34,600
Total acres in project	726,600

Salt: Salt in the irrigation waters, if allowed to concentrate, will build up in the soil to the point of rendering the soil nonproductive for general crops. It is generally accepted that water having in excess of 4,000 parts of salts per 1,000,000 parts of water is the maximum salinity that may be used, and this for only certain crops. Crops such as vegetables, orchards, and many others begin to show distress with more than 1,500 parts of salts per 1,000,000. Also, it is necessary to increase the quantity of water for the crops as the salinity increases, to prevent the excessive concentration of salts at the plant roots.

The concentration of salts in the water is caused by rediversion of the water. As the water is used on the higher lands, the quantity of water is reduced by soil evaporation and plant use, and the remaining or unconsumed water is either pumped out or percolates through the soil to become return flow lower down in the stream. This return flow is still carrying most of the salt that was in the water at the first diversion thereof. In order to bring the salt ratio within tolerance limits for plant life, additional sweet water must be added. In times of water shortage, as is now prevailing within this area, there is no local source of additional water. The repeated repumping and rediversions is resulting in the spreading and intensification of salt concentration in the soils, surface, and underground waters with a start of abandonment in some areas.

The report of the Bureau of Reclamation entitled "Report on Central Arizona Project," appendixes, page B–15, shows 846,000 tons of salt is now brought into this area annually by the diverted water. Water having a salt concentration of 4,000 parts per million parts is equivalent to 5.5 tons of salt per acre-foot. In order to keep this salt moving out and not exceeding 4,000 parts per million of salts in the water will require approximately 154,000 acre-feet per annum of fully salted water to be taken out of the area, with a more rapid lowering of water tables.

Salvage water: Referring to pages 284 and 285 of the report of the Secretary of the Interior, The Colorado River, June 1947, sometimes called the Blue Book, we find that the average natural river losses in the Phoenix area for the period 1897–1943 were 527,000 acre-feet. This water was lost by evaporation from water surfaces and by percolation to adjacent bottom lands where it was evaporated by soils, trees, and other vegetation.

As the valley was settled, the greater part of the valley land subirrigated by the rivers was cleared for farming, much of the virgin growth was removed, and crops planted and irrigated. But the remaining areas which constituted the river channels retained their growths.

With the building of the storage dams and the added and more constant return flow, together with the low frequency of floods to flush out and maintain the channel ways, much of these remaining areas have become very dense with water-loving plants sometimes called phreatophytes. There are areas where such growth has become so dense and rank that there is practically no water channel, causing a very serious flood hazard for the adjacent lands, cities, and towns near the river. This condition must be relieved to prevent serious flood damage, as well as for the salvage of water.

Surveys are now in progress along the Salt River Channel looking to the correction of this condition.

While no accurate or authoritative estimate has been made of the water now being so consumed in these river areas because of the increased density, though lesser acres, than prevailed under virgin conditions, the losses now should be less than in the virgin stage but could easily be as much as 350,000 acre-feet per year. Rough estimates have approximated this amount.

It is not possible to eliminate all of this loss. Evaporation from water and soil will continue and, with effective clearing and reasonable maintenance, some growth will persist to consume some water. However, a considerable part to at least one-half of this loss may be salvaged.

It is estimated net salvage from clearing river channels of phreatophytes at least the above deficit.

In order to protect the underground supply from further depletion and prevent further expansion, the Arizona State Legislature has enacted an underground water code which is now in effect and is being put into operation.

I think the committee has had evidence already presented with respect to that.

It is evident that it will be impossible to use any of the water so proposed to be diverted from the Colorado River for new land without injury to the present irrigated lands, and it is not intended to do so.

The lands in the area are owned by thousands of individuals. There are hundreds of wells scattered over the area, serving mainly individually owned lands. Each owner has his fixed charges and living expenses he must earn to continue the ownership and live. It is therefore not so simple as to say, "Lay out sufficient land to balance the supply." Nor is it the question of considering the cost of a supplemental water supply as being applicable to the number of acres such a supply alone would irrigate. Such a supplemental supply means the

saving of thousands of acres owned by thousands of individuals with their all into the land to keep it from going out of production, and the difference between marginal and full productivity on the many thousands more.

Analysis of water available from all local sources and water needed from Colorado River

	Maricopa County	Pinal County	Total
REQUIREMENTS FOR IRRIGATION			
1. Land previously irrigated	470,000	258,000	728,000
2. Net consumptive use at 3.2 acre-feet per acre	1,504,000	826,000	2,330,000
SUPPLY WITHIN AREA			
3. From Gila River system:			
Salt River	724,000		724,000
Verde River	298,000		298,000
Gila River		311,000	311,000
Agua Fria River	54,000		54,000
4. Other unmeasured side streams: New River, Hassayampa River, Queen Creek, Santa Cruz, and other unnamed streams, excluding Agua Fria River	125,000	65,000	190,000
Total	1,201,000	376,000	1,577,000
5. Less required for salt balance	111,000	60,000	171,000
Net from system	1,090,000	316,000	1,406,000
Deficit	414,000	510,000	924,000
From Colorado River:			
Diversion, Lake Havasu			1,200,000
Less transmission loss to area			150,000
Delivered to area			1,050,000
Less release for salt balance			210,000
Net from Colorado River for irrigation			840,000
Deficit			84,000

NOTE.—This tabulation does not include the upper Gila Valleys, San Pedro Valley, and the city of Tucson Compensation made herein by allowing for the water withheld to serve these areas.

As these lands go out for lack of water or because the cost exceeds the income, it means farm families become destitute, and the loss of business in the area is proportionate, causing more destitution. The lands will be foreclosed for mortgages or sold for taxes. In time, due to the lack of pumping under these conditions, the underground water will rise. This will encourage new people to take up the lands; they and business will prosper for a period; and the process of gradual failures will be repeated. Therefore, a supplemental water supply for this area is a must if the civilization as now exists is maintained and if tragic losses and experience are prevented for the generations to come.

It is therefore evident that without the additional water from the Colorado River, being the only remaining source and found feasible by the report of the Bureau of Reclamation on the central Arizona project, and to which Arizona is justly entitled, the entire economy of the area must be seriously affected, and to the detriment of the national economy.

Mr. MURDOCK. Thank you, Mr. Lane. There will be questions to be asked, I think.

91190—49—ser. 11, pt. 1——31

Our usual practice is to begin on the seniority basis, but it occurs to me that we might reverse that this time.

Mr. Baring, have you any questions?

Mr. BARING. Mr. Chairman, I came in late. I would like to withhold my questions right now.

Mr. MURDOCK. Governor Miles?

Mr. MILES. No questions.

Mr. MURDOCK. Mr. Aspinall?

Mr. ASPINALL. I have a few questions I would like to ask, Mr. Chairman.

Mr. Lane, you made reference to a new underground water code of Arizona. What year was that enacted?

Mr. LANE. It was enacted in this year.

Mr. ASPINALL. This year?

Mr. LANE. About 7 months ago. The latter part of last year. It was a special session of the legislature.

Mr. ASPINALL. Up to this time had there been any State legislation to control those wells?

Mr. LANE. Up to the time of that act there had been no provision for it under law.

Mr. ASPINALL. What prompted the disuse of the wells?

Mr. LANE. The disuse?

Mr. ASPINALL. Yes.

Mr. LANE. The only thing that would prompt disuse of the wells is that they would go dry or the lift would become too deep and it would not be economic to use it.

Mr. ASPINALL. In other words, there was no legal restriction whatsoever?

Mr. LANE. No, sir.

Mr. ASPINALL. Do you have any case law in Arizona relative to the adjudication of underground water?

Mr. LANE. Within the State?

Mr. ASPINALL. Within the State.

Mr. LANE. I would have to defer that to a lawyer. I do not know.

Mr. ASPINALL. So far as you know?

Mr. LANE. I have never heard of one.

Mr. ASPINALL. You have made more or less reference in your statement to salts and salt content of water. Is there any variance in the quantity of salt in the depth of the wells used?

Mr. LANE. Well, generally the upper strata in the wells carry the larger quantity of salts. Quite frequently you can case off those upper strata and get fairly good water out of the well. You will not get as much. The upper strata carry a good quantity of water, but it is the higher salts.

Mr. ASPINALL. In your statement you suggest that you need 1.7 acre-feet of water over and above the required 3 acre-feet of water or in total 4 acre-feet of water for proper irrigation. What happens to that additional 1.7 acre-feet of water that you derive from the streams?

Mr. LANE. It is water that is not consumed by the plants and either percolates into the underground water or runs off the land as waste water and back into the stream.

Mr. ASPINALL. In other words, as I understand your statement now, you need an application of 5.7 acre-feet of water for the proper irrigation of this land; is that correct?

Mr. LANE. That is at the point of diversion, to get the 4 acre-feet to the land. That would include canal losses.

Mr. ASPINALL. In other words, the 1.7 acre-feet is loss from the point of diversion to the place of application?

Mr. LANE. The 1.7 is; yes.

Mr. ASPINALL. Why do you have to have seven-tenths of an acre-foot of water for loss from the place of pumping to the place of application?

Mr. LANE. Well, you have to run it into your farm ditches and your ditch system to get it to the point of use. That is the evaporation and principally the seepage loss in the canal system that you run it into, through to the point of diversion at the land.

Mr. ASPINALL. Do you have any cement-lined canals?

Mr. LANE. There are quite a few cement-lined canals, and those are being increased every year. The farmers are going into that more all the time.

Mr. ASPINALL. It seems to me that the loss of 1.7 acre-feet from the point of diversion to the place of application and seven-tenths of an acre-foot of water from the pump to the place of application is a rather heavy loss. Why is that?

Mr. LANE. Of course, a good deal of this water, Mr. Aspinall, is pumped by irrigation districts into the regular distribution system. That water is carried quite a distance, quite often, before the point of delivery. It is the same general type of loss as you have in gravity water from the point of diversion into the land. It is seepage mainly through your canal system.

Mr. ASPINALL. I have one other question: The wells are not necessarily placed upon the lands where the waters are to be applied, are they?

Mr. LANE. Well, in irrigation districts like the Salt River Valley project, for instance, and other irrigation districts they have a number of wells, that add to their river supply. Those wells, of course, are put at points where they can serve as much of the land as possible under these wells.

Consequently, in those particular areas that water is run some little distance.

Now, one of these wells costs around $30,000. A farmer has to have enough land to justify that well. That well will supply about 300 acres, where it is a private well. Naturally, he will have to run that a half mile or three-quarters of a mile to get down to the lower end of his area.

This 4.7 per acre-foot is the estimate as found by the Bureau of Reclamation in their study and in their report. That is the average of the amount of water required to be pumped to reach the 4 acre-feet at the land.

Mr. ASPINALL. Have you made any study on the question of the deposit of salt in water in reservoirs to see whether or not the water loses its salinity when it is in the reservoir?

Mr. LANE. No; it does not lose its salinity.

Mr. ASPINALL. It does not?

Mr. LANE. No. With evaporation losses it will slightly increase.

Mr. ASPINALL. Has it entered your mind that there might be an increase of salt content in the water in the Colorado River with the

additional usage of such waters by the upper basin States?

Mr. LANE. I think there will be some; yes.

Mr. ASPINALL. You do not think that will seriously handicap your usage of that water?

Mr. LANE. I do not think it will be that much. I think it will still be a rather low content of salt.

Mr. MURDOCK. If my colleague would yield at that point, I just want to make reference to the fact that nothing in the Santa Fe Compact has to do with the quality of water at Lee Ferry.

Mr. ASPINALL. In answer to my distinguished chairman, I think that is right, and personally, I am very glad that is the situation. Nevertheless, I think it will enter into the question of the delivery of water at Lee Ferry sooner or later.

Mr. MURDOCK. I think you are exactly right, but I wanted that fact to be noted in the record as my view.

Mr. Bentsen, do you have any questions?

Mr. BENTSEN. No questions.

Mr. WHITE. Mr. Chairman, I know we are honored with the presence of the junior Senator from the State of Arizona. I think out of courtesy to him and his interest in this committee that he should be permitted to take part in the proceedings and to ask questions and be accorded all the privileges of a member.

Mr. MURDOCK. I think you are exactly right about that, Mr. White, and we hereby extend to the junior Senator from Arizona not only the privilege of sitting with us, but also the privilege of entering into the discussion in the way indicated. We are mighty glad to have you, Senator McFarland.

Senator MCFARLAND. Thank you, sir.

Mr. MURDOCK. Dr. Miller?

Mr. MILLER. No questions.

Mr. MURDOCK. Mr. D'Ewart?

Mr. D'EWART. I was interested in the point which Mr. Aspinall brought up with regard to that 1.7 acre-feet loss in the pumping water between the well and the point of use. I agree with him that it seems to me that is an excessive amount in the short distance you transport the water there.

I think there is one more point he did not bring out, and that is that some of that goes into underground storage if it is lost.

Mr. LANE. Let me get one point straight on that, Mr. D'Ewart: On the pump water there is only seven-tenths lost.

Mr. D'EWART. Even that is large.

Mr. LANE. A large part of that does go in and contribute to the underground water.

Mr. D'EWART. I think you should be congratulated on this very complete report, and certainly on the underground storage in Arizona. It is about as good a paper on that subject as I have ever seen presented to this committee.

Mr. LANE. Thank you, sir.

Mr. D'EWART. I think it is a splendid effort.

Mr. LANE. Thank you.

Mr. D'EWART. If I understand the figures on page 16, you say that the total acreage in the project is 762,600. Do you mean by that the

present acres irrigated, or is that what is within the boundary of the project?

Mr. LANE. Those are acres that have been irrigated and would be irrigated if there were a full amount of water for them every year.

Mr. D'EWART. 762,600 acres?

Mr. LANE. Yes.

Mr. D'EWART. The facilities are there to irrigate this area and have been built and used at one time or another?

Mr. LANE. Yes. You see the situation that exists.

Well, we had a fairly wet year in 1940–41. We have had no run-off to speak of since until this year. The land has had to depend more and more on the pumps, and less on the gravity water.

Now, they do not have enough pump facilities to fully irrigate that land, and if they did it would just pull the underground water out that much faster.

Mr. D'EWART. Taking these figures and applying the availability of water, as shown on page 20, I gather from your study that the deficit for the 762,000 acres would be 924,000 acre-feet. I also gather that in order to take up this deficit you think a diversion from the Colorado River of 1,200,000 acre-feet is necessary. Even that would leave a deficit of 84,000 feet after you allow for stream loss, transmission loss, and for salt control; is that a correct interpretation of your figures?

Mr. LANE. That is correct.

Mr. D'EWART. In other words, in order to adequately serve these 762,600 acres you feel you would need to divert from the Colorado River 1,284,000 acre-feet?

Mr. LANE. Either that or to make up that deficit, which I think can be done, by cleaning up those river channels and salvaging some of the water now being used by that river growth.

Mr. D'EWART. Has any effort been made along that line?

Mr. LANE. There has been a good deal of consideration given it not only there but in other places. It is quite a problem to know just what is the best way to do it.

Mr. D'EWART. I know. In some places they are making a study of the use of chemicals, and killing that growth.

Mr. LANE. Yes. They have been doing some experimenting. It has only been on the experimental basis so far. They have to do something in that area, because this growth has grown so dense that the channels have all grown up. Something will have to be done to salvage water.

Mr. D'EWART. I have seen the same thing in other areas. I have also seen in some areas moss growing in channels when warm weather comes.

Mr. LANE. That is right.

Mr. D'EWART. This study, as I said, Mr. Chairman, is very adequate, and I think it is a splendid presentation.

Mr. LANE. Thank you.

Mr. MURDOCK. Mr. Morris, do you have any questions?

Mr. MORRIS. Mr. Chairman, I believe I have no questions. I was unavoidably delayed in attending the committee this morning, and I heard only a part of the statement of this witness, but I have read

his statement, supplementing the part that I heard; and I will say that this is one of the finest statements that I have ever seen and ever heard concerning the water situation there in Arizona.

I appreciate very much the time and effort which has gone into the preparation of this statement.

Mr. LANE. Thank you.

Mr. MORRIS. It certainly presents, in my judgment, a very clear picture of the water situation there.

Mr. MURDOCK. It is the culmination of pretty extensive studies carried on by the Geological Survey.

Mr. LANE. That is correct.

Mr. MURDOCK. From which you took a good deal of information?

Mr. LANE. Yes.

Mr. MURDOCK. I, too, want to compliment you on your statement. It reflects a critical situation.

Mr. Marshall, have you any questions?

Mr. MARSHALL. No questions.

Mr. MURDOCK. Do you have any further questions, Mr. Sanborn?

Mr. SANBORN. I have no questions.

Mr. MURDOCK. Mr. White, do you have any questions?

Mr. WHITE. Would you go to that relief map there and indicate to us where this district is? I think you called it Maricopa County. Is that the district you are speaking of?

Mr. LANE. This chart?

Mr. WHITE. I beg your pardon?

Mr. LANE. I did not quite understand your question, Mr. White.

Mr. WHITE. We have a relief map here of the great State of Arizona. I am wondering just where this place is located that you are talking about. Would you indicate it on the map?

Mr. MURDOCK. Maybe one of the gentlemen on the front row could help us to point the areas asked about.

Mr. LANE. This is the area [indicating] I have reference to, in green.

Mr. WHITE. In green. I thought that represented a reservoir.

How long a canal from the Colorado River would be necessary to bring water to that land?

Mr. LANE. I believe 234 miles.

Mr. WHITE. How much of a lift in the Colorado River?

Mr. LANE. 987 feet.

Mr. WHITE. I beg your pardon?

Mr. LANE. 987 feet.

Mr. WHITE. The lift is going to be a big factor in the cost of putting water on that land; is it not?

Mr. LANE. That is correct?

The Bureau of Reclamation has all of that information here, and I would rather refer that to them.

Mr. WHITE. In your paper, on page 18, I believe you speak of the underground storage. That is what we call the water table; is it not?

Mr. LANE. The underground storage?

Mr. WHITE. Yes.

Mr. LANE. Well, the USGS has estimated that the available water, what they call the safe yield from underground, would be about 714,000 acre-feet.

Mr. WHITE. That is what is called the water table?

Mr. LANE. That is usually a reference to the level of the water underground.

Mr. WHITE. That determines the depth of the well? There is more draft made from the water table, and then it subsides and the wells have to be dug deeper?

Mr. LANE. We have two water levels that we take into account. One is called the static level or the natural water table level. If you pump you draw that down to what we call the pumping level, which is the depth below the surface that you actually lift that water.

Mr. WHITE. However, is it practical, or economically feasible to lift the water from wells to irrigate lands from any depth?

Mr. LANE. That depends on two or three factors, Mr. White. One is, of course the power that you are using, whether it is fuel or electric power, and what the cost of it is, and the type of crops you are growing. It may cost you quite a different amount if you use electric power at one price or electric power at another price, or fuel oil. It makes quite a bit of difference in your cost. The economics is the controlling factor.

Mr. WHITE. That is a problem we have run into all over the United States.

Mr. LANE. That is right.

Mr. WHITE. If there is no diversion of stream flow the people resort to wells. The cost of electricity is a large factor in the economic feasibility of irrigating lands from wells.

Mr. LANE. That is right.

Mr. WHITE. You do not have any idea just what limitations could be put on this to make it economically feasible to bring up water out of wells?

Mr. LANE. As I say, it depends on so many of those factors of cost. Do you mean with reference to what power should cost for that?

Mr. WHITE. You go on at some length here in your statement about it.

Mr. LANE. I do not know that I understand your question.

Mr. WHITE. I see in the fourth line on page 18 that there is an estimated 527,000 acre-feet of losses in the Phoenix area for seepage. That is quite a volume of water.

Mr. LANE. That is quite a large area.

Mr. WHITE. An acre is about 208 feet square, and to cover it with an acre-foot of water is quite a volume of water.

Mr. LANE. That is right.

Mr. WHITE. If you multiply that by 527,000 times you get a lot of water. How big a stream would you estimate it would take to carry that water?

Mr. LANE. This water is spread over a very large area.

Mr. WHITE. I know, but you are talking about supply, and the leaking out of the bottom of the river, and going into the underground table. According to that figure it would be quite a large bit of the stream which escaped. How big a stream would 527,000 acre-feet be?

Mr. LANE. You mean running the whole year, to make the 527,000 acre-feet?

Mr. WHITE. That is what I imagine it is based on, a unit of a year.

Mr. LANE. It would not be such a tremendously large stream running 12 months.

Mr. WHITE. The water flowing in the river bed carries considerable silt, does it not?

Mr. LANE. In flood periods?

Mr. WHITE. Over the ages does not that silt have a tendency to stay in the river bed?

Mr. LANE. It does to some extent. Your subsequent floods will scour it out again, and you go through the same process again. I have measured in some cases where the absorption was around 1 acre-foot per acre per day in a flood in some of the streams there.

Mr. WHITE. Once that water escapes from the bed of the river through the percolation and establishes a water table that water table is not disturbed, is it? Is there a tendency to go in that direction any more?

Mr. LANE. That, of course, is one of the sources of your underground water supply.

Mr. WHITE. If you put down pumps and drain that water table then the water which escapes from the river will come in to stabilize the water table?

Mr. LANE. That is correct. One of our main sources of water supply.

Mr. WHITE. Could you give us any reason why the State of Arizona would pass a law regulating the use of underground water in this particular area?

Mr. LANE. Why they would pass a law?

Mr. WHITE. They did pass the law.

Mr. LANE. Yes.

Mr. WHITE. Some necessity made that necessary. What happened?

Mr. LANE. Because they were continuously increasing the number of wells when the water supply was already being overdrawn.

Mr. WHITE. They made such heavy drafts on this underground storage of the water table that it was receding and the wells were going dry, and some kind of control had to be exercised so that the supply would not be too scant to supply the people then using the water, is that the idea?

Mr. LANE. That is correct. Something had to be done to stop that expansion there, or they would all go out.

Mr. WHITE. Could you and I go into that area now and acquire a farm and want to put down a well and do it without getting permission of the State of Arizona?

Mr. LANE. On undeveloped land you could not.

Mr. WHITE. You could not on undeveloped land. Would they give us a permit at all to put down a well?

Mr. LANE. On undeveloped land not in the critical area.

Mr. WHITE. So far as undeveloped land is concerned it is useless, because they cannot put a well down?

Mr. LANE. That is right. That is the effect of the act.

Mr. WHITE. Have they put a limit on the use of the existing wells?

Mr. LANE. No, they have not limited those.

Mr. WHITE. I think that is all, Mr. Chairman.

Mr. MURDOCK. Mr. Poulson?

Mr. POULSON. Yes. I want to say for the record that I want to compliment Mr. Lane in that I think he has come here and tried to present an honest picture from his standpoint.

I am speaking as one who is violently opposing the project, but I say that because it is in so much contrast to the statements made yesterday by the reclamation engineer, Mr. Larson. Mr. Lane is putting out the picture.

First of all, I know I am not questioning the need, and I think the others from California are not questioning the need. I think you have presented the picture and have been showing the need and how the water is handled. I like that type of testimony much better than the testimony when a representative of the Government comes up and talks about a project, and has an interest in a bill asking for authorization for additional parts of the project which will cost, in his own terms, around $400,000,000, and still does not present it.

You have presented the whole picture, from your viewpoint, of the need, and on that basis I compliment you.

Mr. LANE. Thank you.

Mr. POULSON. Now, Mr. Chairman, I am going to leave. I understand that you are going to have another engineer, and Mr. Larson, and that you are going to meet tomorrow. I am not going to be here. I just want to say that I will want to have the opportunity after I have read the statements to make my answer, or else it will be made in rebuttal by some of our experts. I just wanted to state that.

Mr. MURDOCK. Off the record.

(Discussion off the record.)

Mr. BARING. I believe there was a question which was not quite answered before. The witness said he did not know the exact cost of the initial pumping lift. I have an approximate figure on that which I would like to put in the record at this time.

Mr. WHITE. I did not ask the cost. I asked the height.

Mr. BARING. The height?

Mr. WHITE. Yes; but I would like to have it for the record.

Mr. BARING. The initial part involving the Parker pumping route will cost over $750,000,000. That is the initial lift.

Mr. WHITE. You mean the cost of the installation.

Mr. MURDOCK. If there are no further questions, we might excuse the witness.

Senator McFarland, did you have any questions?

Senator MCFARLAND. No.

Mr. MURDOCK. I would like to make just two statements, before Mr. Poulson gets away.

Mr. POULSON. That might call for another statement from me, so I do not know.

Mr. MURDOCK. I want this for the record.

We have had now this witness and the preceding witness who have both been engineers. They have given engineering data on the bill, and Mr. Larson said yesterday quite distinctly—I assisted him in calling his attention to the part of the bill which indicated it—that the tunnel indicated in the bill was merely authorized and not a part of the computation.

Mr. POULSON. And they asked for authorization of a part of a project which they admitted today is not feasible. Is Congress going to set a precedent, where we give a blanket authorization and then whenever it becomes feasible, say, "Go ahead and do it"?

Mr. MURDOCK. We will leave that to the judgment of the committee, as to whether or not there is any deception.

Mr. POULSON. I am asking if that is what we are supposed to do.

Mr. MURDOCK. That is exactly what we are doing in this bill. We called attention to that fact yesterday. This tunnel is not computed in the cost, but it is authorized.

That is the point I want to emphasize before we get through with this. I wanted to call attention to the fact that there was no disposition on the part of the witness yesterday or at any previous time to hoodwink the committee by covering up anything. That is a feature of the bill I want emphasized.

Mr. POULSON. I would like to turn to page 3, Mr. Murdock. It starts out there and says:

Such appurtenant dams and incidental works, including interconnecting lines to effectuate coordination with other Federal projects, flood-protection works, desilting dams, or works above Bridge Canyon—

There were no costs shown on that. This is just another method of setting up an authority, because they have asked for everything in general terms that could ever be thought about for the development of the entire Colorado River.

"Or works above Bridge Canyon." A big dam is a works. We are giving them authorization to go ahead and do it.

Then they state back here, as was brought out yesterday, that these said works and whatever is not mentioned in his report, whenever they think it is feasible, are such that they can go to the Appropriations Committee and ask for the money.

Mr. MURDOCK. I think that is quite clear to the committee. I submit it to the committee, that when we authorized great works in the Central Valley of California, or in the Missouri Valley, or in the Columbia Valley, and so on, we did not spell out all the features. There are some features that must be left for future determination in a project that will take 50 or 100 years to build.

Mr. POULSON. But in those bills, Mr. Chairman, they never got the authorization. If you notice, we are coming back right along and asking for specific authorizations.

One of them the other day was before this committee, which the committee authorized. That was an addition to the Central Valley project.

The point is that you are asking for everything in this bill in a general way, so that they will not have to come back for those specific items.

It is my personal belief that the Congress and the committee should retain their prerogatives of deciding when and if these unnamed projects become feasible, and they should come in to the Congress with them and come before the committee, rather than our giving them a blanket authorization.

Mr. WHITE. Let me ask the gentleman from California a question.

Mr. POULSON. Yes.

Mr. WHITE. If the water from the Colorado is divided, and a part is allocated to Arizona, the gentleman would have no opposition to what Arizona did with its share of the water?

Mr. POULSON. You are right there. That is the crux of the whole thing, Mr. White. Our big argument is that this water does not belong to them.

I think Mr. Larson in his report, and in the Interior Department report, and all through, has mentioned that the project depends entirely upon Arizona's interpretation of the contract.

You are right, Mr. White, that I certainly would never think of trying to tell Arizona what she could do with her water. I have no intention of doing so.

I am starting out on the premise, first of all, that this is water definitely in dispute. It is not Arizona's water, and, therefore, we should not by an act of Congress give the water to them.

Mr. WHITE. The purpose of this authorization you are talking about is to provide a means for Arizona to utilize her share of the waters of the Colorado River.

Mr. POULSON. If it is her share.

Mr. WHITE. That will be determined.

Mr. POULSON. That is right. You have hit the nail on the head. Thank you.

Mr. MURDOCK. Mr. Marshall?

Mr. MARSHALL. I was going to say, Mr. Chairman, that these witnesses come from some little distance. So far as I am concerned, I am very interested in this. I realize, of course, that there is a difference of opinion between these two States; but that, perhaps, could be better ironed out in executive session, so as not to interfere with the witnesses whom we have here who are trying to express their opinions to help this committee arrive at a decision.

Mr. MURDOCK. That is a timely and appropriate comment, Mr. Marshall.

Mr. MARSHALL. Thank you.

Mr. MURDOCK. I simply wanted the record to show, however, that I take the evidence of these engineers at face value.

Mr. POULSON. And the record shows that I took Mr. Lane's testimony accordingly, quite apart from Mr. Larson's.

Mr. MURDOCK. It is submitted to the committee's judgment as to whether any preceding witness was trying to conceal anything by phony arithmetic or otherwise.

Thank you, Mr. Lane.

Mr. LANE. Mr. Chairman, there is just one point. I was asked what date the underground water code in Arizona was passed.

Mr. MURDOCK. Yes.

Mr. LANE. I have the exact date here. It was signed April 1, 1948.

Mr. MURDOCK. I would like to make one comment further before you leave, Mr. Lane.

You have indicated a splendid study which is a composite, of course. You have given credit to others who helped you in this. You have even gone to the point of showing how much water is lost by evaporation and also transpiration from this evil river growth and that sort of thing, with the suggestion, of course, that we ought to eliminate that. I concur with you heartily in it.

All of your testimony shows the vital necessity of this particular area, but it applies to all others in the Pacific Southwest, especially utilizing every drop of water, conserving and avoiding, as much as possible, losses through seepage and transpiration from plants and the like.

Mr. WHITE. Might I ask a question of the chairman at this point?

Mr. MURDOCK. Yes.

Mr. WHITE. What river do you have in mind? Is that Colorado River evaporation, or the Salt River, or the Gila River?

Mr. MURDOCK. I am thinking of the Colorado River, the Salt River, and the Gila River. All of those streams have plant growth in them which causes tremendous losses of water as well as the heavy evaporation losses. The witness has shown that the growth of salt cedar and that sort of thing along the Salt River and the Gila River is not only causing great loss of water, but that it constitutes a flood menace. I am glad to have him call that to our attention.

My own town, my own home, my own dwelling in Tempe is menaced, to a certain extent, by the growing salt cedar in the river bed. I fear great damage if it is not cleared out.

Mr. WHITE. Mr. Chairman, I understood from the discussion in the paper of the gentleman here that his remarks were limited to Arizona rivers, the Gila and Salt Rivers. I wonder if that is correct?

Mr. LANE. That is what I was dealing with.

Mr. WHITE. Were you talking about the Gila and the Salt Rivers?

Mr. LANE. I was talking about the Gila system.

Mr. D'EWART. Mr. Chairman, I have a question.

Mr. MURDOCK. Mr. D'Ewart.

Mr. D'EWART. There is one point I do not believe was covered.

Your investigation of this basin and subsurface storage leads you to believe that the strata are such that this water, if it is brought into the basin, would go into this underground storage and would be retained there?

Mr. LANE. Water not consumed by the plants would go into the underground waters and could be reused.

Mr. D'EWART. You think the strata underneath the surface are such that you believe it could be retained?

Mr. LANE. Yes, sir.

Mr. D'EWART. And it would answer that purpose?

Mr. LANE. Yes, sir.

Mr. WHITE. I have just one other question.

Would this land take in the Paradise Valley to the north of the Salt River Valley?

Mr. LANE. The acreage I was dealing with was all the acreage in that area.

Mr. WHITE. That would include the Paradise Valley?

Mr. LANE. Yes, sir.

Mr. MURDOCK. Senator McFarland, I believe you had a comment.

Senator MCFARLAND. I was just going to suggest that we might be able to answer the question in regard to the cases of the underground water. What was that question? I thought maybe we could give it to you now.

Mr. ASPINALL. Senator McFarland, I just asked whether or not there had been any case law developed in Arizona concerning underground water.

Senator MCFARLAND. We have had several cases in Arizona in regard to underground water, Congressman; but the cases have held that although you can appropriate underground waters, it must be the waters of an underground stream. The cases did not affect this percolating water.

For that reason there was not any way of controlling the underground water through the law as developed by the courts, so it was necessary for the legislature to pass this underground water law. That is the reason for it.

Mr. ASPINALL. That was the question I was going to ask. Thank you very much, Senator.

Mr. MURDOCK. Thank you, Mr. Lane.

Mr. LANE. Thank you, sir.

Mr. MURDOCK. Mr. Debler is our next witness.

(Discussion off the record.)

Mr. MURDOCK. Will you please give your name to the reporter?

STATEMENT OF E. B. DEBLER, CONSULTING ENGINEER FOR THE STATE OF ARIZONA

Mr. DEBLER. My name is E. B. Debler. I am a consulting engineer for the State of Arizona.

In the past I was with the Bureau of Reclamation for 28½ years. Most of that time I was in charge of project-planning work. Prior to that time I was in both the railroad and irrigation work for about 10 years, and have been in private practice for the past 2 years.

Mr. MURDOCK. You are well known to us and have a splendid reputation with us. You have had long experience, and that causes me to have a high regard for your statement before I hear it.

Mr. DEBLER. Mr. Chairman, I have here some maps which might help the committee members locate some of these places we talk about.

Mr. MURDOCK. I do not want to delay Mr. Debler, but I want to make note of this one thing: In considering legislation of this sort we have to consider alternatives. What if some such legislation is not enacted?

If Mr. Debler does not touch on that I hope some other witness does, and if some other witness does not, I will have to do so before we conclude the presentation.

You go right ahead, Mr. Debler.

Mr. DEBLER. This statement that I will present, Mr. Chairman, is a statement to show the availability of water for this project.

Mr. MURDOCK. I wish every member of the committee could be here to hear that, because that has been the question most frequently asked: Is there water? Of course, I presume you will be handling the physical availability.

Mr. DEBLER. I go into the physical availability on the basis of the interpretations of the applicable laws as they are particularly stressed by the State of Arizona.

They, however, are also in full agreement with my past opinions thereon.

Source: Water for the project is to be diverted from the Colorado River by pumping from Lake Havasu, impounded by Parker Dam built by the Bureau of Reclamation at the expense of the Metropolitan Water District of Los Angeles, to facilitate diversion by that district, and for other purposes.

Availability of water is controlled by the Colorado River compact, the Boulder Canyon Project Act, and the treaty with Mexico.

Colorado River compact: The Colorado River compact, signed at Santa Fe November 24, 1922, by representatives of Arizona, California, Colorado, Nevada, New Mexico, Utah, and Wyoming, was approved by Congress in section 13 of the Boulder Canyon Project Act of December 21, 1928, with a waiver of that part of article XI requiring approval of the compact by all of the States, such approval by the Congress being conditional on acceptance of the waiver and approval of the compact by California and at least five other States. The States, except Arizona, complied promptly. Arizona ratified on February 24, 1944.

The compact provisions pertinent to the central Arizona project are as follows: Article III—

(a) There is hereby apportioned from the Colorado River system in perpetuity to the upper basin and the lower basin, respectively, the exclusive beneficial consumptive use of 7,500,000 acre-feet of water per annum, which shall include all water necessary for the supply of any rights which may now exist.

(b) In addition to the apportionment in paragraph (a), the lower basin is hereby given the right to increase its beneficial consumptive use of such waters by 1,000,000 acre-feet per annum.

(c) If, as a matter of international comity, the United States of America shall hereafter recognize in the United States of Mexico any right to the use of any waters of the Colorado River system, such waters shall be supplied first from the waters which are surplus over and above the aggregate of the quantities specified in paragraph (a) and (b); and if such surplus shall prove insufficient for this purpose, then the burden of such deficiency shall be equally borne by the upper basin and the lower basin, and whenever necessary the States of the upper division shall deliver at Lee Ferry water to supply one-half of the deficiency so recognized in addition to that provided in paragraph (d).

(d) The States of the upper division will not cause the flow of the river at Lee Ferry to be depleted below an aggregate of 75,000,000 acre-feet for any period of 10 consecutive years reckoned in continuing progressive series beginning with the 1st day of October next succeeding the ratification of this compact.

(f) Further equitable apportionment of the beneficial uses of the waters of the Colorado River system unapportioned by paragraphs (a), (b), and (c) may be made in the manner provided in paragraph (g) at any time after October 1, 1963, if and when either basin shall have reached its total beneficial consumptive use as set out in paragraphs (a) and (b).

The compact (art. IIIa) apportions to each of the upper and lower basins in perpetuity a total of 7,500,000 acre-feet for beneficial consumptive use annually and (art. IIIb) grants the further right to the lower basin to increase its beneficial consumptive use by 1,000,000 acre-feet annually. While article IIIb does not use the word "apportionment" with respect to the 1,000,000 acre-feet, article IIIf clearly earmarks this as apportioned water by grouping it with the apportioned waters of IIIa and IIIc, and by designating as surplus waters available for further apportionment only the waters remaining after either basin shall have reached its total allowance under IIIa and IIIb. Article IIIc establishes the basis for supplying any right later recognized in Mexico and (art. IIIf) leaves the apportionment of any remaining surplus water to be made after October 1, 1963. By the terms of the compact (art. IIId), the States of the upper division cannot cause the flow of the Colorado River at Lee Ferry to be depleted below an aggregate of 75,000,000 acre-feet for any period of 10 consecutive years, and in addition thereto must deliver one-half of the Mexico requirement not met from the surplus remaining beyond the apportionments of 16,000,000 acre-feet to the two basins.

The compact does not define "beneficial consumptive use," nor have the States acted under article VI of the compact to secure such clarification.

The compact in article IIId does place a limitation on such "beneficial consumptive use" with respect to the upper basin in periods of low run-off by designating a specified minimum 10-year delivery of water at Lee Ferry, the downstream limit of the upper basin. It appears only reasonable to conclude then that the intention in article IIIa was to permit the upper basin to deplete the flow of the Colorado

River at Lee Ferry by an average of 7,500,000 acre-feet per year, subject to the specified minimum delivery under article IIId. Likewise, it is concluded that it was the intention in article IIIa, IIIb, and IIIc to permit the lower basin and its component States to deplete the Colorado River at the International Boundary by an average of 8,500,000 acre-feet per year, with each basin to make up one-half the deficiency when remaining surplus waters are inadequate to supply Mexico the amount accorded that nation.

Boulder Canyon Project Act (ch. 42, 45 Stat. 1057): This act, approved December 21, 1928, in section 4 (a), contains the following provisions pertinent to the central Arizona project:

> This act shall not take effect * * * unless and until (1) the States of Arizona, California, Colorado, Nevada, New Mexico, Utah, and Wyoming shall have ratified the Colorado River compact, * * * (2) if said States fail to ratify the said compact within 6 months from the date of the passage of this act then, until 6 of said States, including the State of California, shall ratify said compact * * * and, further until the State of California, by act of its legislature, shall agree irrevocably and unconditionally with the United States and for the benefit of the States of Arizona, Colorado, and Nevada, New Mexico, Utah, and Wyoming * * * that the aggregate annual consumptive use (diversions less returns to the river) of water of and from the Colorado River for use in the State of California, including all uses under contracts made under the provisions of this act and all water necessary for the supply of any rights which may now exist, shall not exceed 4,400,000 acre-feet of the waters apportioned to the lower basin States by paragraph (a) of article III of the Colorado River compact, plus not more than one-half of any excess or surplus waters unapportioned by said compact, such uses always to be subject to the terms of said compact.
>
> The St ates of Arizona, California, and Nevada are authorized to enter into an agreement which shall provide (1) that of the 7,500,000 acre-feet annually apportioned to the lower basin by paragraph (a) of article III of the Colorado River compact, there shall be apportioned to the State of Nevada 300,000 acre-feet and to the State of Arizona 2,800,000 acre-feet for exclusive beneficial consumptive use in perpetuity, and (2) that the State of Arizona may annually use one-half of the excess or surplus waters unapportioned by the Colorado River compact, and (3) that the State of Arizona shall have the exclusive beneficial consumptive use of the Gila River and its tributaries within the boundaries of said State, and (4) that the waters of the Gila River and its tributaries, except return flow after the same enters the Colorado River, shall never be subject to any diminution whatever by an allowance of water which may be made by treaty or otherwise to the United States of Mexico, but if, as provided in paragraph (e) of article III of the Colorado River compact, it shall become necessary to supply water to the United States of Mexico from water over and above the quantities which are surplus as defined by said compact, then the State of California shall and will mutually agree with the State of Arizona to supply, out of the main stream of the Colorado River, one-half of any deficiency which must be supplied to Mexico by the lower basin * * *.

Mr. MURDOCK. From what law or document are you reading?

Mr. DEBLER. The Boulder Canyon Project Act of December 21, 1928.

The more important features of this section of the Boulder Canyon Project Act, are (1) limitation of use by California to a maximum of 4,400,000 acre-feet of IIIa water, plus one-half of any unapportioned water, which was accepted by California in a statute dated March 4, 1929, and (2) Arizona to have exclusive use of its Gila River waters, and (3) in case Mexico is not fully supplied from surplus waters unapportioned, requiring the lower basin to make up a deficiency, such deficiency will be borne equally by Arizona and California out of the main stream of the Colorado River. Again, it will be noted the Congress, only 6 years after the signing of the Colorado River compact and at a time when there was a full and frank discussion of the numerous contentions and interpretations of the compact, intended that

apportionments were to be based on their effect on Colorado River flows, for the upper basin at Lee Ferry, and for the lower basin at the international boundary where delivery is made to Mexico, since surplus waters available for use by Mexico could be measured only at the international boundary where delivery is made to Mexico.

Treaty with Mexico: A treaty relating to the division of the waters of the Rio Grande and of the Colorado and Tijuana Rivers was signed by representatives of the two Governments on February 3, 1944, and, together with the protocol signed November 14, 1944, and clarifying reservations, were ratified by the United States Senate on April 18, 1945, and by the Mexican Senate on September 27, 1945.

The treaty guarantees Mexico a delivery of 1,500,000 acre-feet annually collectively at a number of points on the international boundary in the vicinity of Yuma. This quantity may be reduced in time of extraordinary drought to the same degree that consumptive uses are reduced in the United States.

Mexico is also to receive, without acquiring a permanent right thereto, up to 200,000 acre-feet of additional water when a surplus exists in the supply for users in the United States.

Contract by the State of Arizona with the United States for water: By an agreement dated February 9, 1944, with the United States, Arizona contracted for the storage of water in Lake Mead and for the delivery thereof at points on the Colorado River to be agreed upon, for irrigation and domestic use. The portions of the contract particularly pertinent to the central Arizona project are as follows:

Subject to the availability thereof for use in Arizona under the provisions of the Colorado River compact and the Boulder Canyon Project Act, the United States shall deliver and Arizona, or agencies or water users therein, will accept under this contract each calendar year from storage in Lake Mead, at a point or point of diversion on the Colorado River approved by the Secretary, so much water as may be necessary for the beneficial consumptive use for irrigation and domestic uses in Arizona of a maximum of 2,800,000 acre-feet.

The United States also shall deliver from storage in Lake Mead for use in Arizona, at a point or points of diversion on the Colorado River approved by the Secretary, for the uses set forth in subdivision (a) of this article, one-half of any excess or surplus waters unapportioned by the Colorado River compact to the extent such water is available for use in Arizona under said compact and said act, less such excess or surplus water unapportioned by said compact as may be used in Nevada, New Mexico, and Utah in accordance with the rights of said States as stated in subdivisions (f) and (g) of this article.

The obligation to deliver water at or below Boulder Dam shall be diminished to the extent that consumptive uses now or hereafter existing in Arizona above Lake Mead diminish the flow into Lake Mead, and such obligation shall be subject to such reduction on account of evaporation, reservoir and river losses, as may be required to render this contract in conformity with said compact and said act.

Arizona recognizes the right of the United States and the State of Nevada to contract for the delivery from storage in Lake Mead for annual beneficial consumptive use within Nevada for agricultural and domestic uses of 300,000 acre-feet of the water apportioned to the lower basin by the Colorado River compact, and in addition thereto to make contract for like use of one twenty-fifth of any excess or surplus waters available in the lower basin and unapportioned by the Colorado River compact, which waters are subject to further equitable apportionment after October 1, 1963, as provided in article III (f) and article III (g) of the Colorado River compact.

Arizona recognizes the right of the United States and agencies of the State of California to contract for storage and delivery of water from Lake Mead for beneficial consumptive use in California, provided that the aggregate of all such deliveries and uses in California from the Colorado River shall not exceed the limitation of such uses in that State required by the provisions of the Boulder Canyon Project Act and agreed to by the State of California by an act of its

legislature (ch. 16, Statutes of California of 1929) upon which limitation the State of Arizona expressly relies.

Arizona share of apportioned waters: Arizona, California, and Nevada have not entered into a compact or agreement for a division of lower basin apportionments of water as authorized by sections 4 and 19 of the Boulder Canyon Project Act, nor are they in agreement on such a division.

In arriving at the Arizona share of available waters, the following factors have been taken into consideration:

(*a*) The compact permits the lower basin under articles IIIa and IIIb to deplete stream flow by 8,500,000 acre-feet as heretofore discussed.

(*b*) California, under the terms of section 4 (a) of the Boulder Canyon Project Act, and its conforming statute, is limited to an aggregate annual consumptive use (diversions less returns to the river) of 4,400,000 acre-feet plus one-half of any surplus that may be apportioned to the lower basin after October 1, 1963.

(*c*) Congress by section 4 (a) of the Boulder Canyon Project Act authorized an agreement by Arizona, California, and Nevada providing (1) for division of the 7,500,000 acre-feet of IIIa water, with Arizona apportioned 2,800,000 acre-feet and Nevada 300,000 acre-feet, (2) Arizona may use one-half of the unapportioned waters, (3) Arizona to have exclusive beneficial consumptive use of Gila Basin waters within its borders, and (4) no Gila waters subject to demand to meet Mexico requirements.

Since the California limitation statute limits that State to the use only of IIIa and surplus waters as yet unapportioned, it follows that the 8,500,000 acre-feet of Colorado River depletion apportioned to the lower basin by articles IIIa and IIIb, in the absence of a lower basin agreement, are available to the States as follows: To California not more than 4,400,000 acre-feet; to Arizona and other States, not less than 4,100,000 acre-feet. In the remainder of this statement in the interest of conservatism with respect to Arizona water supply, it is being assumed that the waters of the Colorado River would actually be so divided. Arizona by the water contract of February 9, 1944, recognizes the right of Nevada to a beneficial consumptive use of 300,000 acre-feet of apportioned water, and the rights of Utah and New Mexico to equitable shares of lower basin apportioned water. While the shares of these latter States have not been fixed by agreements, the report "The Colorado River" dated March 1946 by the Bureau of Reclamation, page 184, presents the estimated ultimate depletion by the lower basin portions of these States as follows:

	Acre-feet
New Mexico	37,000
Utah	101,000
Total	138,000

Nevada in the same report is estimated to be able to deplete the stream by 256,800 acre-feet annually, compared with an Arizona recognition in its contract with the United States, of 300,000 acre-feet.

The lack of synchronism in the high and low run-off periods of the Gila and Colorado Rivers, the exceedingly large ground storage capacity available in the Phoenix area to regulate Gila River run-off,

and the freedom of Gila River from water demands for Mexico use make it advisable to segregate the Arizona water allotment as between Gila River uses and uses of the Colorado River and its other tributaries. Arizona (and New Mexico) in most years will fully divert Gila River flows with an inflow to Colorado River of 70,000 acre-feet, being that part of the 166,000 acre-feet of Gila River waters to be released from the Phoenix area for a salt balance with ultimate development reaching the Colorado River. Operations in that area in 1941 showed an ability to reduce Gila River outflow from an estimated 3,700,000 acre-feet under natural conditions, appearing on page 285, March 1946, on Colorado River, United States Bureau of Reclamation, to 590,000 acre-feet. With the increased diversion and storage capacity contemplated within the Gila Basin, it is estimated that flood outflows would be limited to remnants of the 1905, 1916, and 1941 floods, with an average outflow of 64,000 acre-feet for the entire 47-year period. Depletion of Colorado River flows by Gila Basin development would then be as follows:

	Average annual (acre-feet)
Natural outflow from Gila River	1,272,000
Ultimate outflow of waters produced in Gila Basin:	
Return flow for salt balance	70,000
Flood waters	64,000
Total	134,000
The difference is a depletion of	1,138,000
Depletion by New Mexico	24,000
Depletion by Arizona	1,114,000

(In round numbers, 1,100,000 acre-feet.)

The following tabulations present the results of the applications of the compact and pertinent laws, as heretofore discussed.

In the following tabulation quantities are acre-feet per year:

Comparison of apportionments with long-time average flow

Long-time (1897–1943) average flow at international boundary		17,720,000
Taken from p. 12 of the "Blue Book" (March 1946 report, Bureau of Reclamation).		
Apportionments pursuant to the Colorado River compact:		
Upper basin by art. III (a)	7,500,000	
Lower basin by art. III (a) and III (b)	8,500,000	
Mexico by treaty pursuant to art. III (c)	1,500,000	
		17,500,000
Surplus, unapportioned and subject to apportionment after 1963, in accordance with art. III (f)		220,000

Division of lower basin apportionment authorized by Boulder Canyon Project Act

[Gila River, assigned entirely to Arizona with amount of water not stated but at the time generally assumed to be 1,000,000 acre-feet]

	Acre-feet	Percent
Main stream:		
Arizona	2,800,000	37½
California, by required Self-Limitation Act, a maximum of	4,400,000	58⅔
Nevada, main stream	300,000	4
Total	7,500,000	100
Utah and New Mexico, not mentioned in the Boulder Canyon Project Act, estimated in "Blue Book" at	138,000	----------

Division of lower basin available water: Since the Boulder Canyon Project Act in authorizing a lower-basin compact failed to designate any water for the States of Utah and New Mexico, the contemplated use by these States is herein deducted from the total supply ahead of the division between Arizona, California, and Nevada.

Evaporation losses from the main-stream reservoir is similarly deducted since all three States received benefits from these reservoirs by reason of regulation of their water supplies, diversion from the dams and reservoirs, and use of power produced at the dams.

Since Arizona and New Mexico will deplete Gila River by 1,138,000 acre-feet instead of the 1,000,000 acre-feet in mind in the Boulder Canyon Project Act, a suitable adjustment is made to avoid penalizing California and Nevada for this extra Gila River use.

The resulting division is—		*Acre-feet*
Apportioned to lower basin		8,500,000
Less Gila River use contemplated at the time of Boulder Canyon Project Act		1,000,000
Main-stream use contemplated by act		7,500,000
Less:		
Use by New Mexico above Hoover Dam	13,000	
Use by Utah above Hoover Dam	101,000	
Main stream reservoir evaporation	870,000	
		984,000
Available main-stream water for further use		6,516,000
Arizona share, 37½ percent of 6,516,000		2,432,000
Arizona utilization of Colorado River system:		
Available water after deduction for evaporation from main-stream reservoirs:		
Gila River depletion assumed in Boulder Canyon Project Act		1,000,000
Main-stream water		2,432,000
Total		3,432,000
Utilization there:		
First deduct contemplated Gila River depletion by Arizona and New Mexico		1,138,000
That leaves main stream water available for Arizona use of		2,294,000
Present use above Hoover Dam	64,000	
Present use on Williams River	3,000	
Parker Valley, Colorado River (Indian) project, authorized	250,000	
Gila project, authorized	600,000	
Yuma project	130,000	
Total present and authorized		1,047,000
Available for additional projects		1,247,000
Contemplated for central Arizona project:		
Diversion	1,200,000	
Return to Colorado River	88,000	
Net use		1,112,000
Balance for further projects		135,000

Low run-off period of 1930–46. That period is presented because it is the lowest long period of the 47-year period of records on the Colorado River.

Mainstream water:	
Minimum delivery at Lee Ferry	7,500,000
Net gain Lee Ferry to International Boundary exclusive of Gila River (small reduction in inflow offset by reduction in valley loss)	180,000
Gila River ultimate outflow	150,000
Total	7,830,000

Mr. MURDOCK. Do I understand that is the lowest 10 years of recorded history?

Mr. DEBLER. That is the lowest 17-year period. This low period extended through a period of 17 years. The length of that period is controlled by the fact that throughout that period the 7,500,000 acre-feet provision would particularly prevail.

Mr. MURDOCK. I am glad to be corrected on that. I was thinking of a provision in the compact, but you say this is the lowest 17 years of recorded river flow?

Mr. DEBLER. Yes. Throughout that period in practically every year some water would have to be drawn from storage at Lake Mead in order to fully satisfy the downstream requirements, the lower basin requirements.

Mr. MURDOCK. Thank you.

Mr. DEBLER. Lower basin long-time use 6,516,000.

Mainstream reservoirs, et cetera. I have put the et cetera in to represent the use at that time also of the States of Utah and New Mexico above Boulder Dam. Total 600,000.

Mexico 1,500,000. That makes a total of 8,616,000.

Deficiency to be secured by draw-down at Lake Mead 786,000.

Necessary total draw-down in 17-year period 13,362,000.

Available for draw-down 18,000,000.

Mr. WHITE. Is that 18,000,000 acre-feet altogether, or just Arizona's share?

Mr. DEBLER. That is the total amount that the reservoir could be drawn down from a full content, such as it would have at the beginning of this period, until you have drawn down to the point where you would seriously interfere with power production.

Mr. MURDOCK. We thank you, Mr. Debler, for that presentation. There are many questions arising in our minds. I would like to open up the matter a little in this way:

In the beginning you quoted from the Boulder Canyon Project Act, and also from the Santa Fe compact. Why did you make use of these documents?

Mr. DEBLER. I will go back. The Colorado River compact divides the waters between the basins only, and the ratification of that act required California to impose a limitation upon itself with regard to its maximum use of water. Nowhere in the compact is there anything further bearing on the division of water among the lower basin States.

That division of water, which I have here outlined, is the one that is presented in the Boulder Canyon Project Act. At the time that that act was passed there was a great deal of negotiation toward a lower basin compact.

I might say that that seemed to represent the compromise agreement that the lower basin States were to enter into, under which the

three States of Arizona, California, and Nevada would divide the main stream waters on the basis of 2,800,000, 4,400,000, and 300,000 acre-feet, respectively. In each case an acre-foot of water was the same in each State. Whatever burdens would fall on any 1 acre-foot would be the same kind of burden for any other State.

Mr. MURDOCK. Would you turn to your paper again, toward the bottom of page 10. [Reading:]

California, by required Self-Limitation Act, a maximum of 4,400,000—58⅔ percent.

of the total for the lower basin. Is that what you mean?

Mr. DEBLER. It is 58⅔ percent of the waters available from the main stream in the lower basin.

Mr. MURDOCK. That is the first time I have seen those broken down in that way. Arizona is 37½ percent?

Mr. DEBLER. That is right.

Mr. MURDOCK. Nevada, 4 percent?

Mr. DEBLER. Yes.

Mr. MURDOCK. I wish you would explain that phrase qualifying the middle item:

"California, by required Self-Limitation Act," I would like to have that stressed.

Mr. DEBLER. I think the easiest way to do that, Mr. Chairman, is to read from the Boulder Canyon Project Act, where that is contained.

Mr. MURDOCK. Yes, that is best. Read the law; and then you do not have to express an opinion.

Mr. DEBLER. That is right.

Mr. MURDOCK. That is reasonable.

Mr. WHITE. What page is that on? Where is California required to meet and by its legislature put a limitation upon itself?

Mr. DEBLER. That is right. I have here this 1948 volume, on the Hoover Dam Documents by Wilbur and Ely; and in that volume it is on page A215.

Mr. MURDOCK. You quoted it in your paper. Would you give us a page reference on your paper? Is it page 2?

Mr. DEBLER. It is also in my paper; that is true.

Mr. MURDOCK. Yes. It begins on page 3, I believe, and goes on to page 4.

Mr. DEBLER. It is on pages 3 and 4, right at the top of the page. That is probably the easiest place to get it.

* * * and, further until the State of California, by act of its legislature, shall agree irrevocably and unconditionally with the United States and for the benefit of the States of Arizona, Colorado, and Nevada, New Mexico, Utah, and Wyoming * * * that the aggregate annual consumptive use (diversions less returns to the river) of water of and from the Colorado River for use in the State of California, including all uses under contracts made under the provisions of this act and all water necessary for the supply of any rights which may now exist, shall not exceed 4,400,000 acre-feet of the waters apportioned to the lower basin States by paragraph (a) of article III of the Colorado River compact, plus not more than one-half of any excess or surplus waters unapportioned by said compact, such uses always to be subject to the terms of said compact.

That limitation by California upon herself was required in order to secure approval of this compact by the United States.

California then proceeded to do that, using the very words that are in the Boulder Canyon Project Act, in its statute of March 4, 1929.

Mr. MURDOCK. Are you well enough acquainted with the history of that congressional act to explain why that provision was put in there? Can you explain how the younger States in the basin tried to protect themselves?

Mr. DEBLER. As I recall that, Mr. Chairman, it was primarily the upper basin that was afraid of excessive expansion of uses in California, and at a later time of the claim that California should be permitted to go ahead and have water for all the projects that they then had in mind.

Arizona was also a very interested State, of course, and one of the reasons that Arizona did not ratify the compact until 1944 was that from the time that the compact was signed in 1922 until the Boulder Canyon Project Act was really fully debated, about 1925 and 1926, there were negotiations between Arizona and California for a compact, and it became evident then that California intended to make and desired to make a much greater use of the Colorado River than appeared to be equitable in the eyes of Arizona.

Mr. MURDOCK. What evidence, then, do you have of that?

Mr. DEBLER. At this time that is just my memory of the correspondence and the debates and the discussions of those years.

Mr. MURDOCK. Do you have any evidence of California's later intent to use more than 4,400,000 acre-feet plus any possible surplus of water?

Mr. DEBLER. Well, I have heard at these hearings, particularly before the Senate, the representatives of California unequivocally state that they needed the full 5,362,000 acre-feet to take care of the projects that are authorized and existing.

Mr. MURDOCK. What facilities do they have for taking care of that amount of water?

Mr. DEBLER. The canals which have been built by California, or which have been built for California——

Mr. MURDOCK. You mean, in California?

Mr. DEBLER. And in California, as they come out of the river, generally speaking, are of a size adequate to use that amount of water in the various diversions.

Mr. MURDOCK. As an engineer would you say that those facilities are larger than is required to use that assured amount of water?

Mr. DEBLER. They could be made to use somewhat more, but that was what they were intended to use.

Mr. ENGLE. Will the gentleman yield?

Does the gentleman think there is any impropriety in California building a larger aqueduct than is necessary for 4,400,000 acre-feet?

Mr. DEBLER. Not at all. I would say that California was strictly within her rights, and if she so elected it is thoroughly proper for California to build those canals any size she wishes.

Mr. ENGLE. That is true; because California is entitled to half of any surplus of excess water, is that not correct?

Mr. DEBLER. I do not know just what the California ideas were with regard to surplus waters.

Mr. ENGLE. But the compact provides, does it not, that they get 4,400,000 acre-feet and half of any surplus? If there is any surplus California gets half of it. Therefore, if they build an aqueduct which would only hold 4,400,000 acre-feet and subsequently had some excess

or surplus they would be put to great expense and inconvenience in enlarging the aqueduct. It seems to me just good sense.

Mr. MURDOCK. I get the point, exactly.

How much possible surplus could there be over the 4,400,000 acre-feet? Could you give that approximately? Would the surplus be that much extra?

Mr. DEBLER. With the present apportionments and with our present-day estimates of the average flows, the total surplus for the entire system is only 220,000.

Mr. MURDOCK. According to that somebody has been figuring on a pretty big half of a surplus, have they not?

Mr. DEBLER. I do not know, Mr. Chairman, just what they have been figuring on.

Mr. MURDOCK. I would like to pursue this just a little bit further.

What is the capacity of the All-American Canal from the diversion dam to the Mexican border?

Mr. DEBLER. It starts with a capacity of 15,000 second-feet. At the syphon drop power plant, where most of the water is taken off for the Yuma project, right opposite the city of Yuma, the capacity reduces to 13,000 second-feet. A few miles further down, at the Pilot Knob power plant, where water is being delivered to Mexico, the capacity reduces to 10,000 second-feet; and that is the capacity as the canal enters the Imperial Valley.

Mr. MURDOCK. Translated into acre-feet, what would 15,000 second-feet mean?

Mr. DEBLER. If the canal were to be——

Mr. MURDOCK. Running full all the time.

Mr. DEBLER. Running full all the year round, that would be roughly 11,000,000 acre-feet a year.

Mr. MURDOCK. In other words, there is a canal that can divert from the Colorado River at the Imperial diversion dam 11,000,000 acre-feet?

Mr. DEBLER. That is right.

Mr. MURDOCK. There is another diversion I want to speak of, but I do not want to get away from this yet.

Did I understand you to say that the All-American Canal is reduced to 10,000 second-feet from Pilot Knob on into Imperial Valley?

Mr. DEBLER. Ten thousand second-feet.

Mr. MURDOCK. Yes. It is 13,000 second-feet in the last stretch of the canal down to Pilot Knob, is it not?

Mr. DEBLER. That is right.

Mr. MURDOCK. But from Pilot Knob, which is right on the border, from that point on into California into the Imperial Valley it is only 10,000 second-feet?

Mr. DEBLER. That is right.

Mr. MURDOCK. There is a difference of 3,000 second-feet. How much is 3,000 second-feet in terms of acre-feet?

Mr. DEBLER. It is about 2,169,000 acre-feet per year.

Mr. MURDOCK. Suppose that the canal is running full down to Pilot Knob. What would become of that 2,169,000 acre-feet at Pilot Knob?

Mr. DEBLER. That could be dumped either into the Alamo Canal, which serves Mexico, or into the Colorado River.

Mr. MURDOCK. Did you say 2,169,000 acre-feet?

Mr. DEBLER. Two million, one hundred and sixty-nine thousand acre-feet per year.

Mr. MURDOCK. That is what we are talking about.

Mr. ENGLE. Will you yield?

Mr. MURDOCK. Just a moment, please. I want to establish something here.

Is that not a bottleneck? If you carry that much water down to Pilot Knob you cannot carry it on into Imperial Valley. It has to be dumped into Mexico some way or other, does it not?

Mr. DEBLER. That is right.

Mr. MURDOCK. When was this canal built?

Mr. DEBLER. The All-American Canal, I believe, was started about 1935 or 1934. I am not too sure; but it was right in there some time.

Mr. MURDOCK. It was begun and planned after the Limitation Act of 1929; is that not true?

Mr. DEBLER. That is right.

Mr. MURDOCK. I think somebody has some explaining to do. We have heard our friends from California affirm that they believe in keeping their irrevocable covenants, and the act of 1929 was such an irrevocable covenant made between the State of California on the one hand and the United States of America on the other, for the benefit of the six other States named alphabetically.

Yet they have built an expensive, permanent canal costing upward of, perhaps, $40,000,000, which is supposed to last 1,000 years, to take care of the California share for Imperial Valley and some surplus, but able to take care of twice the amount of the limitation. I want that emphasized in the record so that we can look at it, to compare profession and practice.

Mr. WHITE. Mr. Chairman, at the proper moment I wish you would yield to me for a question.

Mr. MURDOCK. I will yield in just a moment.

Mr. WHITE. Just one question.

Mr. MURDOCK. There is another diversion you speak of, Mr. Debler. Take the Los Angeles aqueduct. What is its capacity?

Mr. DEBLER. It was constructed for a nominal capacity of 1,600 second-feet, and intended originally to convey the 1,100,000 acre-feet of water contracted for by the metropolitan water district. It is now proposed, however, to carry in addition to that water the 112,000 acre-feet contracted to San Diego.

Mr. MURDOCK. Therefore to the 11,000,000 acre-feet which the All-American Canal will divert and carry for a distance, there is then to be added the 1,100,000 acre-feet, making something over 12,000,000 acre-feet, which California has constructions completed, but not paid for, to carry water, after the State of California limited herself to 4,400,000 acre-feet plus surplus.

Now I yield to Mr. White.

Mr. WHITE. I just want to ask one question.

You spoke of water drafted at Pilot Knob. Does the United States not get credit from Mexico for that amount of water delivered at that point?

Mr. DEBLER. To the extent that water is delivered at the Pilot Knob wasteway in accordance with the delivery schedules set up.

Mr. WHITE. We have a treaty with Mexico set up to deliver so much water?

Mr. DEBLER. I will finish this statement, sir.

That is delivered to that point within the schedules that Mexico sets up under its treaty; it is credited against the required delivery to Mexico.

Mr. WHITE. Mexico, of course, would not let that water go to waste, would she? Would she demand additional water in the place of that water at some other point?

Mr. DEBLER. The main reason for that 3,000 second-feet was of course for utilization for power purposes prior to the time that the Colorado River would be rather fully utilized.

Mr. WHITE. As I understand it, you have to have a continuous flow at Pilot Knob to energize that power plant the year round. Mexico may not want that water at all seasons. You say they can dump the water. The point I want to find out is this: we have a canal that carries a certain capacity to that point and is reduced from there on. We have to release part of the water at that point. That is for delivery to Mexico. Do we get credit from Mexico as to other waters, and let that water go to waste?

Mr. DEBLER. Mr. White, the Mexican treaty contemplates delivery at three separate points. One, right there at the Pilot Knob power plant; two, in the river below Yuma, sort of opposite the power plant, you might say; and, three, at what is called San Luis, a town at the south border of the Yuma Valley, where a delivery has been made for many years.

Under the treaty Mexico can each year specify how it wants those deliveries divided, subject to certain limits on the use of the All-American Canal.

To the extent that the deliveries at the Pilot Knob power plant comply with that schedule the uses receive credit for delivery.

Mr. WHITE. Thank you, sir. Now, Mr. Chairman, I yield and thank the chairman for the courtesy of letting me develop that point.

Mr. MURDOCK. Yes, Mr. White. I think I would like to supplement the answer given, because I think you are not clear on one thing.

We spoke about dumping water at Pilot Knob, in Old Mexico, by an oversized canal that could easily carry more than 2,000,000 acre-feet to that point where it could be dumped. In fact, it can carry much more than that. You understand, however, that there is not a power plant there yet.

The witness brought with him this morning the "Hoover Dam documents," by Wilbur and Ely, which is a public document which no doubt all of you have, House Document No. 717, second edition. I want to call attention to the fact that the last three items in this collection are communications.

The very last letter is a reply from the State Department in answer to Chairman Hewes, of the Imperial irrigation district, concerning this very matter. Please note the proposal.

You find in these two letters signed by Chairman Hewes, of the Imperial irrigation district, to the State Department, and especially in the second letter, on pages A915–917, about a power plant, that the Imperial irrigation district is asking certain things. One request is control of the All-American Canal, including the diversion dam, as I

understand it, and then asking to build a power plant at Pilot Knob with a capacity that would use more than 5,000,000 acre-feet of water annually.

Now, I want the committee to understand that when that water goes through the wasteway of the power plant it is in Mexico, and not capable of being used in the United States.

The next to the last letter in that collection, bearing on that very point, is attempting to get a power plant. The last letter is a rather noncommittal reply from the State Department to the effect that some arrangements might be worked out.

That was to me a very alarming letter. I wrote the Secretary of State, while General Marshall was still Secretary, and I said, in effect:

It does not make any difference about the contract of 1932. It is against good public policy for the United States of America, the State Department, representing our dealings in foreign affairs, to let the control of the All-American Canal and the Imperial Diversion Dam fall into the hands of any private organization, because it now has an international use and obligation, and it is the duty of the State Department to see that some agency of the United States Government—especially two, the State Department and the Department of the Interior—keep control of that diversion works and the All-American Canal.

Mr. WELCH. May I interrupt at this point, Mr. Chairman?

Mr. MURDOCK. If you do not get me off the subject, Mr. Welch.

Mr. WELCH. The water at the Pilot Knob power plant, as you have described, after it is used would go into Mexico.

Mr. MURDOCK. Yes, sir.

Mr. WELCH. Is that water over and above the amount of water provided in the treaty between this country and Mexico?

Mr. MURDOCK. Yes, sir; that undoubtedly is a part of their plan. Let me show that from their own correspondence.

I am referring now to this letter dated January 9, 1948, to the Honorable George C. Marshall, Secretary of State, and signed by Mr. Evan T. Hewes, president of the board of directors of the Imperial irrigation district, I believe, and I am referring also to a reply from the State Department of August 4, 1948, which alarmed me.

I understand since that time that my fears that the State Department might fall for the suggestion were not altogether justified. I think the matter has possibly been safeguarded; but I wanted to call it to the attention of the committee, that here is an attempt made to build a works at Pilot Knob that will take a large volume of water out of the river over and above the California limitation, and possibly 10 times the amount legally required for Mexico, and dump it in Mexico.

Mind you, Congressman Welch, it is much over the treaty requirements. The Mexican treaty requires only 500,000 acre-feet of water annually to go down through the All-American Canal to be delivered at Pilot Knob.

Mr. WHITE. Mr. Chairman, do you not think you can be reassured by the fact that the Imperial Valley irrigation district or the Department of the Interior has no power to alter or modify the terms of a treaty with Mexico, without ratification of the Senate?

Mr. MURDOCK. No, that does not give me complete assurance, Congressman White. If they got what they sought, I believe they could if they wished to breach the treaty.

Let me restate that, Congressman Welch. It is true that the treaty calls for 1,500,000 acre-feet annually for Mexico. That is the treaty requirement, but the treaty also requires that for a period of years 500,000 acre-feet of that shall be delivered, as the witness said, at Pilot Knob. Now, I would be glad enough to see power produced by that, at the Pilot Knob drop under the right circumstances and control.

Mr. WHITE. If the water were not used by Arizona at the diversion, it would be surplus when it got down there?

Mr. MURDOCK. Pilot Knob is right on the border; yes.

Mr. WHITE. But it is way below any place where Arizona could divert the water.

Mr. MURDOCK. Yes, Arizona could not use water dropped there. While I am on this, Mr. Debler, you speak of the Los Angeles aqueduct having a capacity of 1,100,000 acre-feet?

Mr. DEBLER. That is right. That is what it was originally built for.

Mr. MURDOCK. It was originally built for that. Have you ever heard of any talk about enlarging that aqueduct?

Mr. DEBLER. Not except just a few hints that California could use a whole lot more water over in the Los Angeles area. Just how to get it over there had not been thought about much, apparently, but there is a possibility of enlarging that aqueduct.

Mr. MURDOCK. Would it be possible to keep that Los Angeles aqueduct running 100 percent every day in the year, within the California limitation?

Mr. DEBLER. Yes.

Mr. MURDOCK. In other words, with a quantity of water of approximately 4,400,000 acre-feet, more or less, it is possible to furnish 1,100,000 acre-feet to Los Angeles without any jeopardizing the Los Angeles water supply.

Mr. DEBLER. You say, "without jeopardizing the Los Angeles water supply"?

Mr. MURDOCK. Yes.

Mr. DEBLER. I do not quite understand you there, Mr. Chairman.

Mr. MURDOCK. Now, Los Angeles counts on 1,100,000 acre-feet of water, which is more than the great city of New York is now using; and they could get that water—could they not—within the California limitation.

Mr. DEBLER. That is an internal matter there, Mr. Chairman. It is a matter which the Californians have to decide among themselves, as to who gets which share of the water.

Mr. MURDOCK. So they do. For that reason, I suggest that the gentlemen who have the metropolitan water district as their clients would be better protecting the interest of those clients in the State of California than in Washington.

But, this is a mathematical question I ask: Is it possible to subtract 1,100,000 acre-feet of water from 4,400,000 acre-feet?

Mr. DEBLER. That is right. That leaves 3,300,000.

Mr. MURDOCK. You are a good mathematician.

Mr. ENGLE. Wait a minute. You do not get 3,300,000 with that subtraction if you charge California for the evaporation and losses on the river; do you?

Mr. DEBLER. That is without deducting it. I had not gone into that.

Mr. ENGLE. There is 600,000 acre-feet of water there which, if Arizona does not get it under its contention, would come out of the 4,400,000 acre-feet; is there not?

Mr. DEBLER. That is right.

Mr. ENGLE. That would make a different figure, then?

Mr. MURDOCK. Are those evaporation losses computed to be as much as 3,300,000 acre-feet?

Mr. ENGLE. I said 600,000 acre-feet, approximately.

Mr. DEBLER. Congressman Engle is correct. California's share averages about 600,000, or pretty close to it.

Mr. MURDOCK. Suppose that we take the 600,000 acre-feet away from the 4,400,000 acre-feet. That leaves 3,800,000 acre-feet.

Mr. DEBLER. About that.

Mr. MURDOCK. You can still get 1,100,000 acre-feet out of that amount; can you not?

Mr. DEBLER. And leave quite a little more.

Mr. ENGLE. But we are given 4,400,000 net, Mr. Chairman.

Mr. MURDOCK. Never mind about that. I am just presenting California with her true picture.

You are right, Mr. Debler; these matters were fixed by internal State affairs. I resent anyone trying to convince this committee, Congress, and the American people that by Arizona coming here and asking for 1,100,000 acre-feet of water it is jeopardizing the water supply of the cities on the west coast. Now, if they want their billion gallons of water daily, which they ought to have, let them fix it themselves out of their legally recognized quota. That is what I am talking about the hoax putting city needs against Arizona's claim.

Mr. WHITE. Mr. Chairman?

Mr. MURDOCK. Mr. White.

Mr. WHITE. Mr. Chairman, we can spare a lot of our surplus water out of the Columbia River if you can find some way to get it.

Mr. MURDOCK. I hope the other gentlemen will feel the same way about it.

Mr. WHITE. It is all over my land now.

Mr. ENGLE. May I ask Mr. Debler a question?

Mr. MURDOCK. Mr. D'Ewart has a question first.

Mr. D'EWART. I have a couple of questions.

Including the Gila River, there goes to the lower basin 8,500,000 acre-feet, leaving out evaporation and so forth. Not considering the Gila River, you have 7,500,000 acre-feet to divide among the four or five States. What I am trying to determine is: What acre-feet are allotted to each State on which there is no dispute? Tell me if these figures are correct: 4,400,000 to California, 2,662,000 to Arizona, 300,000 to Nevada, and 138,000 to Utah and New Mexico. That is 7,500,000 acre-feet. Is there any dispute about those figures so far?

Mr. DEBLER. Yes. The division set up in the Boulder Canyon Project Act was 2,800,000 acre-feet to Arizona, 300,000 acre-feet to Nevada; and that, together with the limited 4,400,000 acre-feet to California, made the 7,500,000 acre-feet.

Mr. D'EWART. What I did was to add California's 4,400,000 with Nevada, Utah, and New Mexico, and subtracted that from the 7,500,000, and I came out with 2,662,000 acre-feet for Arizona.

Mr. DEBLER. Yes. What you did, Mr. D'Ewart, was that you deducted the Utah and New Mexico use from Arizona.

Mr. D'EWART. Yes.

Mr. DEBLER. You deducted it from the 2,800,000, and got 2,662,000.

Mr. D'EWART. I see; 2,800,000.

Mr. DEBLER. I see no reason for deducting the use by those two States from Arizona. There would be just as much reason to deduct it from the 4,400,000 that California uses.

Instead of doing it that way, because the Boulder Canyon Project Act did not mention those States, in my statement I deducted that 138,000 acre-feet ahead of the three States mentioned in the Boulder Canyon Project Act.

Mr. D'EWART. The first question is: From what figure is the Nevada, Utah, and New Mexico water to be deducted? Is there any question about that?

Mr. DEBLER. Nevada was definitely mentioned in the Boulder Canyon Project Act, along with Arizona and California.

Mr. D'EWART. I see.

Mr. DEBLER. The act did not mention Utah and New Mexico. Consequently, what has been done in my statement, because amounts for Utah and New Mexico were not set, is that I have taken from the blue book of the Bureau of Reclamation what they consider to be the ultimate possible development in the States of New Mexico and Utah; and it is shown to be 138,000. I deduct that first of all from that total supply for the lower basin, and then divide the rest between Arizona, California, and Nevada as contemplated by the Boulder Canyon Project Act.

Mr. D'EWART. Does California accept that?

Mr. ENGLE. California does not.

Mr. D'EWART. What water is in dispute?

Mr. ENGLE. There are three classes of water in dispute. The III (b) water under the compact; the additional 1,000,000 acre-feet which the lower basin is entitled to——

Mr. D'EWART. I was coming to that.

Mr. ENGLE. That is 1,000,000 acre-feet. There is approximately 600,000 acre-feet in dispute, which is evaporation losses. Then there is the difference between what California contends Arizona is charged with on the Gila and what Arizona contends Arizona is charged with, which amounts to another 1,000,000,000 acre-feet. Those are the disputes.

Mr. D'EWART. On the question of the Gila, the dispute is whether it should be considered as surplus waters to be divided, or whether it is allotted wholly to California?

Mr. ENGLE. That is the III (b) water.

Mr. D'EWART. That is the III (b) water.

Mr. ENGLE. Our contention is that III (b) water is not allotted water; and, therefore, Arizona and California should split that 1,000,000, which would be 500,000 each way.

On the Gila the difference is whether you take the inflow-outflow method of computation, or whether you take on-the-site use computation of beneficial consumptive use. We contend that Arizona is charged with all the water that they actually used to grow spuds and everything else. Arizona contends it is only charged with the amount

of water which it reduces, what would be the theoretical flow of the Gila River at its confluence with the Colorado.

Is that right, Mr. Debler?

Mr. DEBLER. Yes. The depletion of the Colorado River itself.

Mr. WHITE. Let me ask a question, Mr. Chairman.

Mr. MURDOCK. Mr. D'Ewart has the floor.

Mr. D'EWART. One more question before I yield.

We have had before the Subcommittee on Indian Affairs the matter of the Navajo and the irrigation up there. In your figures on pages 10, 11, and 12, where do the waters allegedly the property of the Navajo Indians appear? Here is the question: Out of what waters in your tabulations on pages 10, 11, and 12 will the water come that belongs to the Navajos for the San Juan irrigation project? Whose allotment under the compact would that come from?

Mr. DEBLER. That is the upper-basin water; it is not the lower-basin water.

Mr. D'EWART. Part of it. Not all of it.

Mr. DEBLER. The main part of the Navajo Reservation, and substantially all irrigation, is in the upper basin.

Mr. D'EWART. It does not not come out of the lower basin?

Mr. MURDOCK. Not for the Navajos or the Hopis.

Mr. D'EWART. That clears that up.

Mr. DEBLER. It is mainly New Mexico water.

Mr. MURDOCK. Mr. White?

Mr. WHITE. Mr. Debler, due to the physical conditions, there is no way in the world that California could get any water out of the Gila River; is there?

Mr. DEBLER. No. The Gila River is on the opposite side of the Colorado.

Mr. WHITE. The mouth of the Gila is way below any place California could divert water?

Mr. DEBLER. Until the All-American Canal was built, Mr. White, California did divert some of the Gila River water, because the Gila River entered the Colorado River above the intake for the Imperial canal until the All-American Canal was built. Until that time California was diverting some of the Gila River water.

Mr. WHITE. Was that not the main bone of contention between California and Arizona in signing the compact; that California wanted to have the Gila waters included in the volume that Arizona would get, and Arizona's contention was that that water was there in the State and entered the river so far down that it was not available to California, and was entirely Arizona water? Was that not the main trouble, and the reason Arizona did not ratify the compact?

Mr. DEBLER. That is not my memory of it. The main difficulty, as I remember it, was the division of the main-stream waters.

Mr. WHITE. The trouble was that they wanted to include the Gila waters in the main stream waters, and Arizona's contention was that it was wholly in the State of Arizona and should not be included in the main stream waters of the Colorado River. For that reason, they refused to ratify the compact.

Mr. DEBLER. Well, these arguments about the Gila River were prior to the compact. Originally, the thought was to just divide the main-

stream waters, leaving the Gila River out of it. Then, of course, the trouble came up of trying to leave one river out of the compact.

Mr. WHITE. Yes.

Mr. DEBLER. The idea being that, if you left one river out, a lot of States would want other rivers left out.

Mr. WHITE. Was the river they wanted left out of the compact the Gila?

Mr. DEBLER. That was the Gila River. When the compact was finally signed up, it included the entire Colorado River system.

Mr. WHITE. There was a great deal of pressure put on Arizona to ratify the compact. It was done right here on the floor of the House. I can remember when money was stricken out of the appropriation bill for Arizona, due to the fact that Arizona failed to ratify the compact. Was there not a great deal of pressure put on Arizona to force them to ratify the compact?

Mr. DEBLER. Yes; there was a lot of it.

Mr. MURDOCK. Have you concluded?

Mr. WHITE. I just would like to compliment the witness on one of the finest engineering reports that has ever come to my attention. It is exhaustive. It is complete. It takes in not only the engineering features, but the legal features. It is going to make a splendid reference, and I commend the members of the committee to retain this report in their files, because it brings out all the facts.

I just want to enlarge on this a little bit. There is a statement that the compact was signed by Arizona on November 24, 1922. The Arizona representative did sign?

Mr. DEBLER. That is right.

Mr. WHITE. But the legislature refused to ratify?

Mr. DEBLER. That is right.

Mr. WHITE. It ran along for 22 years—to be exact, until 1944—before it was ratified?

Mr. DEBLER. That is right.

Mr. ENGLE. Will the gentleman yield to me?

I would like to ask at this point whether or not Arizona considers itself to be a beneficiary of the basic Colorado River compact?

Do you think, Mr. Debler, that your ratification 22 years after the signing of the compact makes you a part of it?

Mr. DEBLER. Well, I think Arizona is just as much a part of it as any other State.

Mr. ENGLE. Can you point to any place where Congress has consented to a seven-State compact?

Mr. DEBLER. It originally consented to a seven-State compact, but they also put in a proviso that the Boulder Canyon Project Act would be effective if six States at that time signed. To my way of looking at it, there was a provision for both six- and seven-State signatures.

Mr. ENGLE. Yes; but the six-State compact is predicated upon California passing the Self-Limitation Act. Is that not true?

Mr. DEBLER. Yes; that is very true, but that was for the benefit of all the States in the United States.

Mr. ENGLE. I understand that.

Mr. DEBLER. Including Arizona.

Mr. ENGLE. What I am trying to determine is whether or not Arizona claims the benefit of the limitation under the six-State compact and the benefits under the seven-State compact as well?

Mr. DEBLER. Certainly.

Mr. ENGLE. In other words, you want to retain the benefits of the Limitation Act placed on California because Arizona would not come into the seven-State compact, and then 22 years later acquire the benefits of the seven-State compact. Is that it?

Mr. DEBLER. That is exactly what was intended.

Mr. ENGLE. I understand that this Boulder Canyon Project Act had a limitation of 6 months in it on the seven-State compact. If the seven-State compact was not ratified in 6 months, then the six-State compact would be entered into with the Limitation Act. Is that not correct?

Mr. DEBLER. As I see it, the only purpose of that 6-month provision was merely to permit the project to go ahead without waiting for ratification by Arizona, but it in no way deprived Arizona of anything she could have gotten by ratification prior to that time.

Mr. ENGLE. That is right; but do you think you can come along 22 years later and claim those benefits?

Mr. DEBLER. I should think so. I cannot see anything wrong with that.

Mr. ENGLE. I just want to raise the point; I have great doubt about it.

Mr. WELCH. May I ask a question, Mr. Chairman?

Mr. MURDOCK. Had you finished, Mr. White?

Mr. WHITE. I wanted to go into one little subject here, Mr. Chairman.

I will yield to the gentleman from California first, though.

Mr. MURDOCK. Go ahead, Mr. Welch.

Mr. WELCH. By what means could the Imperial irrigation district, a private corporation, acquire ownership of the All-American Canal?

Mr. MURDOCK. I will answer that pretty briefly. The All-American Canal was built, as I understand it—I will be corrected if I am wrong—by the Bureau of Reclamation under a contract of 1932. It was repayable somewhat as most of these works are when built by the Government. However, there is a peculiar provision in the contract, which I will want to discuss with the committee a little later. I think that we ought to say that the title to the All-American Canal is in the United States. Is that right, Mr. Debler?

Mr. DEBLER. The legal title is. The beneficial title to that canal, after completion, was contemplated to be in a project, like it is with all Bureau projects.

Mr. WELCH. The present title to the All-American Canal is in the United States Government?

Mr. DEBLER. It is, and there will so remain until Congress takes action to the contrary.

Mr. WELCH. If it were to be transferred to the ownership of a private corporation, it would have to be done by an act of Congress, would it not?

Mr. DEBLER. That is my understanding.

Mr. WELCH. Mr. Chairman, I have heard it said that the Imperial Irrigation District, a private corporation, has large interests in the

Alamo Canal in Mexico, together with vast acreages of fertile land that could be irrigated from the Alamo Canal. Would that possibly be a motive for releasing water from the projected Pilot Knob power plant into Mexico and into the Alamo Canal, which in turn could be used for the irrigation of a vast acreage which I am told the corporation is a large stockholder?

Mr. MURDOCK. That is a question that would take some little time to answer, but it should be answered, for it touches the very thing that I fear. What is the motive of some of the witnesses that appear in opposition on this bill before this committee? Such may prove to be the case, judging from testimony in former congressional hearings. It is an important point.

Mr. WHITE. Mr. Chairman?

Mr. MURDOCK. Yes.

Mr. WHITE. If I understood it correctly, the letter and application was not to take title to the canal, but to take the control of the canal.

Mr. MURDOCK. You are right. What they were asking for was full and complete control, on the assumption that the private corporation would carry out the international obligations for the State Department, at a saving to Uncle Sam of quite a sum of money, and they asked to do that, and I have opposed it.

Mr. WHITE. Is that Alamo Canal a Mexico project?

Mr. MURDOCK. That was Mr. Welch's question. I think the succeeding witnesses will show that there is a relationship which this committee needs to look into.

Mr. WHITE. Trying to get an interlocking directorate, or something like that.

Mr. WELCH. Mr. Chairman, without attempting to indicate my position as to the issue between the State of California and the State of Arizona over the allocation of water of the Colorado River, if what I have heard and briefly stated here be true, some people should be put under oath as to the ownership and financial interest in the Alamo Canal and the vast acreage within the Republic of Mexico.

Mr. MURDOCK. Congressman Welch, I think this is a matter that ought to be investigated fully by this committee. Ordinarily we do not put witnesses under oath, but we have already had extensive hearings both before the House and the Senate, and those must be brought in to answer your question.

Mr. WELCH. This committee has the right to put witnesses under oath.

Mr. D'EWART. Mr. Chairman, I have one question.

Mr. ENGLE. Mr. Chairman.

Mr. MURDOCK. Just a moment, please. May I continue? We are about to close for lunch, at least. I want this record to show that I am not trying to take any water away from the great cities of the west coast, or the Los Angeles Metropolitan Water District.

They have the aqueduct, and they built it with their own money. I take off my hat to them for having made that investment.

The thing I want this committe to understand quite thoroughly—and I hope other witnesses coming along will cinch this matter—is this: If you do not furnish Arizona the water which she is asking for in this legislation it will go on down as surplus, and it will be used for the profit of people who do not have a claim to it.

Mr. WHITE. Mr. Chairman.

Mr. ENGLE. Now, Mr. Chairman, I have been trying to be recognized here for 25 minutes.

Mr. WHITE. I yield to the gentleman.

Mr. ENGLE. I think I am entitled to some consideration.

Mr. WHITE. I yield to the gentleman from California.

Mr. MURDOCK. Mr. White yields to you.

Mr. ENGLE. I want to say to the chairman that all that California wants is what California is legally entitled to. If California is legally entitled to 4,400,000 acre-feet of water plus one-half of the surplus, whatever that is, what California does with it is California's own business. I do not think California is going to dump any water into the Gulf of Mexico.

Mr. MURDOCK. They have been dumping it into the Salton Sea.

Mr. ENGLE. We are not going to get into that now. I think that can be properly shown as a necessary function of any water program.

However, what California does with its water is not Arizona's business. All we want to happen is for this great marble building or temple near here, over which is written the words, "Equal Justice Under Law," to have its occupants sit down and tell us what we are entitled to.

When we have a decision as to what is allocated to us under the contract we are not going to argue with Arizona about what they do with their water.

Now, Mr. Chairman, I want to read from the Boulder Canyon Project Act, section IV (a), which says:

This act shall not become effective unless and until (1) the States of Arizona, California, Colorado, Nevada, New Mexico, Utah, and Wyoming shall have ratified the Colorado River compact mentioned in section 13 hereof, and the President by public proclamation shall have so declared, or—

and I emphasize this word "or," because this word "or" in the compact places it in the alternative—

or (2) if said States shall fail to ratify the said compact within 6 months from the date of the passage of this act then until six of the said States—

six of the said States—

including the State of California, shall ratify said compact—

and I emphasize this—

and shall consent to waive the provisions of the first paragraph of article XI of said compact, which makes the same binding and obligatory only when approved by each of the seven States signatory thereto, and shall have approved said compact without conditions save that of such six-State approval and the President by public proclamation shall have so declared and found, until the State of California, by act of its legislature—

and then I cease quoting.

It goes on to mention that California must put a limitation upon itself.

The reason I want that in the record at this point, Mr. Chairman, is that I want to make it perfectly clear that there is no seven-State compact. There is no seven-State compact which has been agreed to by the other six States. There is no seven State compact which has been consented to or ratified by Congress.

My point, and the one I was making with this witness, is that Arizona cannot claim and accept the benefits of the Limitation Act im-

posed upon California, because Arizona failed to ratify under the terms of this act; and then turn around 22 years later and claim the benefits of a seven-State compact which does not exist; without first disgorging the benefits which accrued under the Limitation Act, and getting the consent of the other six States to a seven-State compact, in addition to the consent of the Congress of the United States.

Mr. WELCH. May I state further, briefly, Mr. Chairman?

Mr. MURDOCK. Yes, Mr. Welch.

Mr. WELCH. I want this for the record. I shall go as far as any member of the California delegation or any resident of my State of California in protecting the rights of the State of California; but I, on the other hand, want it definitely understood that I have no interest in a private corporation referred to as the Imperial Irrigation District of California, a private corporation, which may have an interest in dumping the water after it is used as the Pilot Knob power plant into Mexico and into the Alamo Canal, for irrigation of their private holdings in the Republic of Mexico. I make that distinction. I want it definitely understood.

I repeat again: I will go the full distance for my State, but I have no concern in selfish interest.

Mr. ENGLE. Neither am I; and, for a further matter, I am not interested in red herrings.

Mr. MURDOCK. Mr. Welch, I greatly appreciate your statement. What is the pleasure of the committee with regard to an afternoon session?

Mr. WHITE. Can you get permission from the Speaker?

Mr. MURDOCK. We do not have a session today, and it is not necessary.

Mr. WHITE. Before I yielded to the gentleman from California, and following the remarks of the chairman, I was about to observe that if it had not been for the solemn compact entered into, which enabled the Boulder Canyon project, there would have been no water in certain seasons of the year to have any dispute over. The people of the State of California made it possible to regulate the flow.

Mr. MURDOCK. We have held hearings so late that possibly we had better not attempt to have a meeting this afternoon, but instead have one tomorrow at 9:30 a. m. Would that be satisfactory?

Mr. MILES. May I say something before we go?

Mr. D'EWART. I have one other question, too.

Mr. ENGLE. Mr. Chairman, is that an understanding; that we do not meet this afternoon?

Mr. MURDOCK. That is right.

Mr. MILES. I want to make this statement: I certainly do appreciate the witness' testimony, because he is the first one I have heard who has recognized and mentioned the rights of New Mexico to this water.

Mr. MURDOCK. Mr. D'Ewart?

Mr. D'EWART. I live 2,000 or 3,000 miles away from this project, so I hope that someone will show me what connection the Alamo canal has with H. R. 934, this bill.

Mr. MURDOCK. It is one of those alternatives that I spoke of. If we do not pass some such legislation as the bill before us, there is going to be a lot of water called surplus but belonging to someone else that

will go down into that canal for somebody's benefit. That is the connection. It will be tragic for the losers if that happens.

Mr. WELCH. Off the record.

(Discussion off the record.)

Mr. MURDOCK. That will conclude the testimony of Mr. Debler. We thank you, sir.

Mr. DEBLER. I would like to make a little request, if I can, Mr. Chairman, that my paper in its entirety be printed just as is in one place.

Mr. MURDOCK. Without objection, it is so ordered.

(The document is as follows:)

STATEMENT BY E. B. DEBLER, CONSULTING ENGINEER FOR THE STATE OF ARIZONA BEFORE THE HOUSE COMMITTEE ON PUBLIC LANDS ON H. R. 934 AND 935 EIGHTY-FIRST CONGRESS, FIRST SESSION, CENTRAL ARIZONA PROJECT WATER SUPPLY

SOURCE

Waters for the project are to be diverted from the Colorado River by pumping from Lake Havasu, impounded by Parker Dam built by the Bureau of Reclamation at the expense of the Metropolitan Water District of Los Angeles, to facilitate diversion by that district, and for other purposes.

Availability of water is controlled by the Colorado River compact, the Boulder Canyon Project Act, and the treaty with Mexico.

COLORADO RIVER COMPACT

The Colorado River compact, signed at Santa Fe November 24, 1922, by representatives of Arizona, California, Colorado, Nevada, New Mexico, Utah, and Wyoming, was approved by Congress in section 13 of the Boulder Canyon Project Act of December 21, 1928, with a waiver of that part of article XI requiring approval of the compact by all of the States, such approval by the Congress being conditional on acceptance of the waiver and approval of the compact by California and at least five other States. The States, except Arizona, complied promptly. Arizona ratified on February 24, 1944.

The compact provisions pertinent to the Central Arizona project are as follows:

ARTICLE III

(*a*) There is hereby apportioned from the Colorado River system in perpetuity to the upper basin and to the lower basin, respectively, the exclusive beneficial consumptive use of 7,500,000 acre-feet of water per annum, which shall include all water necessary for the supply of any rights which may now exist.

(*b*) In addition to the apportionment in paragraph (*a*), the lower basin is hereby given the right to increase its beneficial consumptive use of such waters by 1,000,000 acre-feet per annum.

(*c*) If, as a matter of international comity, the United States of America shall hereafter recognize in the United States of Mexico any right to the use of any waters of the Colorado River system, such waters shall be supplied first from the waters which are surplus over and above the aggregate of the quantities specified in paragraphs (*a*) and (*b*); and if such surplus shall prove insufficient for this purpose, then the burden of such deficiency shall be equally borne by the upper basin and the lower basin, and whenever necessary the States of the upper division shall deliver at Lee Ferry water to supply one-half of the deficiency so recognized in addition to that provided in paragraph (*d*).

(*d*) The States of the upper division will not cause the flow of the river at Lee Ferry to be depleted below an aggregate of 75,000,000 acre-feet for any period of 10 consecutive years reckoned in continuing progressive series beginning with the 1st day of October next succeeding the ratification of this compact.

(*f*) Further equitable apportionment of the beneficial uses of the waters of the Colorado River system unapportioned by paragraphs (*a*), (*b*), and (*c*) may be made in the manner provided in paragraph (*g*) at any time after October 1, 1963, if and when either basin shall have reached its total beneficial consumptive use as set out in paragraphs (*a*) and (*b*).

The compact (art. IIIa) apportions to each of the upper and lower basins in perpetuity a total of 7,500,000 acre-feet for beneficial consumptive use annually and (art. IIIb) grants the further right to the lower basin to increase its beneficial consumptive use by 1,000,000 acre-feet annually. While article IIIb does not use the word "apportionment" with respect to the 1,000,000 acre-feet, article IIIf clearly earmarks this as apportioned water by grouping it with the apportioned waters of IIIa and IIIc, and by designating as surplus waters available for further apportionment only the waters remaining after either basin shall have reached its total allowance under IIIa and IIIb. Article IIIc establishes the basis for supplying any right later recognized in Mexico and article IIIf leaves the apportionment of any remaining surplus water to be made after October 1, 1963. By the terms of the compact (art. IIId), the States of the upper division cannot cause the flow of the Colorado River at Lee Ferry to be depleted below an aggregate of 75,000,000 acre-feet for any period of 10 consecutive years, and in addition thereto must deliver one-half of the Mexico requirement not met from the surplus remaining beyond the apportionments of 16,000,000 acre-feet to the two basins.

The compact does not define "beneficial consumptive use," nor have the States acted under article VI of the compact to secure such clarification.

The compact in article IIId does place a limitation on such "beneficial consumptive use" with respect to the upper basin in periods of low run-off by designating a specified minimum 10-year delivery of water at Lee Ferry, the downstream limit of the upper basin. It appears only reasonable to conclude then that the intention in article IIIa was to permit the upper basin to deplete the flow of the Colorado River at Lee Ferry by an average of 7,500,000 acre-feet per year, subject to the specified minimum delivery under article IIId. Likewise it is concluded that it was the intention in article IIIa, IIIb, and IIIc to permit the lower basin and its component States to deplete the Colorado River at the international boundary by an average of 8,500,000 acre-feet per year, with each basin to make up one-half the deficiency when remaining surplus waters are inadequate to supply Mexico the amount accorded that nation.

BOULDER CANYON PROJECT ACT (CH. 42, 45 STAT. 1057)

This act, approved December 21, 1928, in section 4 (a), contains the following provisions pertinent to the central Arizona project:

"This act shall not take effect * * * unless and until (1) the States of Arizona, California, Colorado, Nevada, New Mexico, Utah, and Wyoming shall have ratified the Colorado River compact * * * (2) if said States fail to ratify the said compact within six months from the date of the passage of this Act then, until six of said States, including the State of California, shall ratify said compact * * * and, further until the State of California, by act of its legislature, shall agree irrevocably and unconditionally with the United States and for the benefit of the States of Arizona, Colorado, and Nevada, New Mexico, Utah, and Wyoming * * * that the aggregate annual consumptive use (diversions less returns to the river) of water of and from the Colorado River for use in the State of California, including all uses under contracts made under the provisions of this act and all water necessary for the supply of any rights which may now exist, shall not exceed four million four hundred thousand acre-feet of the waters apportioned to the lower basin states by paragraph (a) of article III of the Colorado River compact, plus not more than one-half of any excess or surplus waters unapportioned by said compact, such uses always to be subject to the terms of said compact.

"The States of Arizona, California, and Nevada are authorized to enter into an agreement which shall provide (1) that of the 7,500,000 acre-feet annually apportioned to the lower basin by paragraph (a) of article III of the Colorado River compact, there shall be apportioned to the State of Nevada 300,000 acre-feet and to the State of Arizona 2,800,000 acre-feet for exclusive beneficial consumptive use in perpetuity, and (2) that the State of Arizona may annually use one-half of the excess or surplus waters unapportioned by the Colorado River compact, and (3) that the State of Arizona shall have the exclusive beneficial consumptive use of the Gila River and its tributaries within the boundaries of said State, and (4) that the waters of the Gila River and its tributaries, except return flow after the same enters the Colorado River, shall never be subject to any diminution whatever by an allowance of water which may be made by treaty or otherwise to the United States of Mexico but if, as provided in paragraph (c) of article III of the Colorado River compact, it shall become necessary to supply

water to the United States of Mexico from waters over and above the quantities which are surplus as defined by said compact, then the State of California shall and will mutually agree with the State of Arizona to supply, out of the main stream of the Colorado River, one-half of any deficiency which must be supplied to Mexico by the lower basin. * * *"

The more important features of this section of the Boulder Canyon Project Act are (1) limitation of use by California to a maximum of 4,400,000 acre-feet of IIIa water, plus one-half of any unapportioned water, which was accepted by California in a statute dated March 4, 1929, and (2) Arizona to have exclusive use of its Gila River waters, and (3) in case Mexico is not fully supplied from surplus waters unapportioned, requiring the lower basin to make up a deficiency, such deficiency will be borne equally by Arizona and California out of the main stream of the Colorado River. Again, it will be noted the Congress, only 6 years after the signing of the Colorado River compact and at a time when there was a full and frank discussion of the numerous contentions and interpretations of the compact, intended that apportionments were to be based on their effect on Colorado River flows, for the upper basin at Lee Ferry, and for the lower basin at the international boundary where delivery is made to Mexico, since surplus waters available for use by Mexico could be measured only at the international boundary where delivery is made to Mexico.

TREATY WITH MEXICO

A treaty relating to the division of the waters of the Rio Grande and of the Colorado and Tijuana Rivers was signed by representatives of the two Governments on February 3, 1944, and, together with the protocol signed November 14, 1944, and clarifying reservations, were ratified by the United States Senate on April 18, 1945, and by the Mexican Senate on September 27, 1945.

The treaty guarantees Mexico a delivery of 1,500,000 acre-feet annually collectively at a number of points on the international boundary in the vicinity of Yuma. This quantity may be reduced in time of extraordinary drought to the same degree that consumptive uses are reduced in the United States.

Mexico is also to receive, without acquiring a permanent right thereto, up to 200,000 acre-feet of additional water when a surplus exists in the supply for users in the United States.

CONTRACT BY THE STATE OF ARIZONA WITH THE UNITED STATES FOR WATER

By an agreement dated February 9, 1944, with the United States, Arizona contracted for the storage of water in Lake Mead and for the delivery thereof at points on the Colorado River to be agreed upon, for irrigation and domestic use. The portions of the contract particularly pertinent to the central Arizona project are as follows:

"Subject to the availability thereof for use in Arizona under the provisions of the Colorado River compact and the Boulder Canyon Project Act, the United States shall deliver and Arizona, or agencies or water users therein, will accept under this contract each calendar year from storage in Lake Mead, at a point or points of diversion on the Colorado River approved by the Secretary, so much water as may be necessary for the beneficial consumptive use for irrigation and domestic uses in Arizona of a maximum of 2,800,000 acre-feet.

"The United States also shall deliver from storage in Lake Mead for use in Arizona, at a point or points of diversion on the Colorado River approved by the Secretary, for the uses set forth in subdivision (*a*) of this article, one-half of any excess or surplus waters unapportioned by the Colorado River compact to the extent such water is available for use in Arizona under said compact and said act, less such excess or surplus water unapportioned by said compact as may be used in Nevada, New Mexico, and Utah in accordance with the rights of said States as stated in subdivisions (*f*) and (*g*) of this article.

"The obligation to deliver water at or below Boulder Dam shall be diminished to the extent that consumptive uses now or hereafter existing in Arizona above Lake Mead diminish the flow into Lake Mead, and such obligation shall be subject to such reduction on account of evaporation, reservoir, and river losses, as may be required to render this contract in conformity with said compact and said act.

"Arizona recognizes the right of the United States and the State of Nevada to contract for the delivery from storage in Lake Mead for annual beneficial consumptive use within Nevada for agricultural and domestic uses of 300,000 acre-feet of the water apportioned to the lower basin by the Colorado River compact,

and in addition thereto to make contract for lake use of one twenty-fifth of any excess or surplus waters available in the lower basin and unapportioned by the Colorado River compact, which waters are subject to further equitable apportionment after October 1, 1963, as provided in article III (*f*) and article III (*g*) of the Colorado River compact.

"Arizona recognizes the right of the United States and agencies of the State of California to contract for storage and delivery of water from Lake Mead for beneficial consumptive use in California, provided that the aggregate of all such deliveries and uses in California from the Colorado River shall not exceed the limitation of such uses in that State required by the provisons of the Boulder Canyon Project Act and agreed to by the State of California by an act of its legislature (ch. 16, Statutes of California of 1929) upon which limitation the State of Arizona expressly relies."

ARIZONA SHARE OF APPORTIONED WATERS

Arizona, California, and Nevada have not entered into a compact or agreement for a division of lower-basin apportionments of water as authorized by sections 4 and 19 of the Boulder Canyon Project Act, nor are they in agreement on such a division.

In arriving at the Arizona share of available waters, the following factors have been taken into consideration:

(*a*) The compact permits the lower basin under articles IIIa and IIIb to deplete stream flow by 8,500,000 acre-feet, as heretofore discussed.

(*b*) California, under the terms of section 4 (a) of the Boulder Canyon Project Act, and its conforming statute, is limited to an aggregate annual consumptive use (diversions less returns to the river) of 4,400,000 acre-feet plus one-half of any surplus that may be apportioned to the lower basin after October 1, 1963.

(*c*) Congress by section 4 (a) of the Boulder Canyon Project Act authorized an agreement by Arizona, California, and Nevada providing (1) for division of the 7,500,000 acre-feet of IIIa water, with Arizona apportioned 2,800,000 acre-feet and Nevada 300,000 acre-feet; (2) Arizona may use one-half of the unapportioned waters; (3) Arizona to have exclusive beneficial consumptive use of Gila Basin waters within its borders; and (4) no Gila waters subject to demand to meet Mexico requirements.

Since the California limitation statute limits that State to the use only of IIIa and surplus waters as yet unapportioned, it follows that the 8,500,000 acre-feet of Colorado River depletion apportioned to the lower basin by articles IIIa and III(b), in the absence of a lower-basin agreement, are available to the States as follows: To California not more than 4,400,000 acre-feet; to Arizona and other States, not less than 4,100,000 acre-feet. In the remainder of this statement in the interest of conservatism with respect to Arizona water supply, it is being assumed that the water contract of February 9, 1944, recognizes the right of Arizona by the water contract of February 9, 1944, recognizes the right of Nevada to a beneficial consumptive use of 300,000 acre-feet of apportioned water, and the rights of Utah and New Mexico to equitable shares of lower-basin apportioned water. While the shares of these latter States have not been fixed by agreements, the report, The Colorado River, dated March 1946, by the Bureau of Reclamation, page 184, presents the estimated ultimate depletion by the lower-basin portions of these States as follows:

	Acre-feet
New Mexico	37,000
Utah	101,000
Total	138,000

Nevada in the same report is estimated to be able to deplete the stream by 256,800 acre-feet annually, compared with an Arizona recognition in its contract with the United States of 300,000 acre-feet.

The lack of synchronism in the high and low run-off periods of the Gila and Colorado Rivers, the exceedingly large ground storage capacity available in the Phoenix area to regulate Gila River run-off, and the freedom of Gila River from water demands for Mexico use, makes it advisable to segregate the Arizona water allotment as between Gila River uses and uses of the Colorado River and its other tributaries. Arizona (and New Mexico) in most years will fully divert Gila River flows with an inflow to Colorado River of 70,000 acre-feet, being that part of the 166,000 acre-feet of Gila River waters to be released from the Phoenix area for a salt balance with ultimate development, reaching the Colorado River.

Operations in that area in 1941 showed an ability to reduce Gila River outflow from an estimated 3,700,000 acre-feet under natural conditions (p. 285, March 1946 on Colorado River, U. S. Bureau of Reclamation), to 590,000 acre-feet. With the increased diversion and storage capacity contemplated within the Gila Basin, it is estimated that flood outflows would be limited to remnants of the 1905, 1916, and 1941 floods with an average outflow of 64,000 acre-feet for the entire 47-year period. Depletion of Colorado River flows by Gila Basin development would then be as follows:

		Average annual acre-feet
Natural outflow from Gila River		1,272,000
Ultimate outflow of waters produced in Gila Basin:		
Return flow for salt balance	70,000	
Flood waters	64,000	
		134,000
Depletion		1,138,000
Depletion by New Mexico		24,000
Depletion by Arizona		[1] 1,114,000

[1] In round numbers 1,100,000 acre-feet.

The following tabulations present the results of the applications of the compact and pertinent laws, as heretofore discussed.

In the following tabulations, quantities are acre-feet per year.

Comparison of apportionments with long-time average flow

Long time (1897–1943) average flow at international boundary	[1] 17,720,000

[1] From p. 12 of the Blue Book (March 1946 report, Bureau of Reclamation).

Apportionments pursuant to the Colorado River compact:		
Upper basin by art. III (a)	7,500,000	
Lower basin by art. III (a) and III (b)	8,500,000	
Mexico by treaty pursuant to art. III (c)	1,500,000	
		17,500,000
Surplus, unapportioned and subject to apportionment after 1963, in accordance with art. III (f)		220,000

Division of lower basin apportionment authorized by Boulder Canyon Project Act

[Gila River, assigned entirely to Arizona with amount of water not stated but at the time generally assumed to be 1,000,000 acre-feet]

	Acre-feet	Percent
Main stream:		
Arizona	2,800,000	37½
California, by required Self-Limitation Act, a maximum of	4,400,000	58⅔
Nevada, main stream	300,000	4
Total	7,500,000	100
Utah and New Mexico, not mentioned, estimated in blue book at	138,000	

Division of lower basin available water

Since the Boulder Canyon Project Act in authorizing a lower basin compact failed to designate any water for the States of Utah and New Mexico, the contemplated use by these States is herein deducted from the total supply ahead of the division between Arizona, California, and Nevada.

Evaporation losses from the main stream reservoir is similarly deducted since all three States receive benefits from these reservoirs by reason of regulation of their water supplies, diversion from the dams and reservoirs, and use of power produced at the dams.

Since Arizona and New Mexico will deplete Gila River by 1,138,000 acre-feet instead of the 1,000,000 acre-feet in mind in the Boulder Canyon Project Act, a suitable adjustment is made to avoid penalizing California and Nevada for this extra Gila River use.

The resulting division is:		
Apportioned to lower basin		8,500,000
Less Gila River use contemplated at time of Boulder Canyon Project Act		1,000,000
Main stream use contemplated by act		7,500,000
Less:		
Use by New Mexico above Hoover Dam	13,000	
Use by Utah above Hoover Dam	101,000	
Main stream reservoir evaporation	870,000	
		984,000
Available main stream water for further use		6,516,000
Arizona share 37½ percent of 6,516,000		2,432,000

Arizona utilization of Colorado River System

Available water after deduction for evaporation from mainstream reservoirs:		
Gila River depletion assumed in Boulder Canyon Project Act		1,000,000
Main stream water		2,432,000
Total		3,432,000
Utilization:		
Contemplated Gila River depletion by Arizona and New Mexico		1,138,000
Main stream water available for Arizona use		2,294,000
Present use above Hoover Dam	64,000	
Present use on Williams River	3,000	
Parker Valley (Colorado River) (Indian) project, authorized	250,000	
Gila project, authorized	600,000	
Yuma project	130,000	
Total present and authorized		1,047,000
Available for additional projects		1,247,000
Contemplated for central Arizona project:		
Diversion	1,200,000	
Return to Colorado River	88,000	
		1,112,000
Balance for further projects		135,000

Low run-off period 1930–46

Main stream water:		
Minimum delivery at Lee Ferry		7,500,000
Net gain Lee Ferry to international boundary exclusive of Gila River (small reduction in inflow offset by reduction in valley loss)		180,000
Gila River ultimate outflow		150,000
Total		7,830,000
Lower basin long-time use	6,516,000	
Main stream reservoirs, etc	600,000	
Mexico	1,500,000	
		8,616,000
Deficiency to be secured by draw-down at Lake Mead		786,000
Necessary total draw-down in 17-year period		13,362,000
Available for draw-down		18,000,000

Mr. MURDOCK. The subcommittee stands adjourned until 9:30 tomorrow morning.

(Thereupon, at 12:45 p. m., Friday, May 6, 1949, an adjournment was taken until 9:30 a. m., Saturday, May 7, 1949.)

THE CENTRAL ARIZONA PROJECT

SATURDAY, MAY 7, 1949

HOUSE OF REPRESENTATIVES,
SUBCOMMITTEE ON IRRIGATION AND RECLAMATION
OF THE COMMITTEE ON PUBLIC LANDS,
Washington, D. C.

The subcommittee met at 9:30 a. m., Hon. John R. Murdock (chairman) presiding.

Mr. MURDOCK. The committee will come to order, please. The Subcommittee on Irrigation and Reclamation has reconvened this morning to have further hearings on H. R. 934.

Mr. Charlie Carson, of Phoenix, Ariz., is our next witness. The committee is well acquainted with Mr. Carson, but we would like to have him identify himself for the record rather fully.

Mr. WELCH. Mr. Chairman, before we proceed, may I ask what is the correct title of the corporation?

Mr. CARSON. The Imperial irrigation district.

Mr. MURDOCK. There are officials of the Imperial irrigation district of California scheduled as witnesses, and if it is not exactly officially correct, we will have it corrected for the record.

Mr. CARSON. Yes.

Mr. MURDOCK. Proceed, Mr. Carson. You are the last affirmative witness for Arizona. What you do not cover I will have to cover.

STATEMENT OF CHARLES A. CARSON, PHOENIX, ARIZ., COUNSEL FOR THE ARIZONA INTERSTATE STREAM COMMISSION

Mr. CARSON. Mr. Chairman, my name is Charles A. Carson. I live and practice law in Phoenix, Ariz. I am chief counsel for the Arizona Interstate Stream Commission and also a special counsel for the State of Arizona on Colorado River matters and a representative authorized to speak on behalf of the Governor of Arizona.

My only compensation for all of the services I render in connection with water matters is paid by the Arizona Interstate Stream Commission.

Mr. Chairman, there are very few members of the committee here this morning. Mr. Engle requested that I stay until Monday morning for cross-examination, which I will do; so I think we can make more progress now if I may be permitted to put some statements in the record and furnish copies to each member of the committee and to the clerk for those who are not here and have them printed in the record in one place and then go ahead with a short oral statement this morning. If that is agreeable to the committee, I will proceed along that line.

Mr. MURDOCK. Without objection, Mr. Carson's prepared statement which has been supplied the committee may be inserted in the record as is, and each member will be furnished with a copy by Mrs. McMichael, and the witness will confine himself to a summary of this or other pertinent matters connected with it.

Mr. CARSON. This statement is headed "Statement of Charles A. Carson, Chief Counsel of Arizona Interstate Stream Commission." I would appreciate it if that could be printed in the record at one place.

Mr. MURDOCK. It will be, exactly as furnished.

(The statement above referred to is as follows:)

STATEMENT OF CHARLES A. CARSON, CHIEF COUNSEL OF ARIZONA INTERSTATE STREAM COMMISSION

My name is Charles A. Carson. I practice law in, and my home is in Phoenix, Ariz. I am a member of the firm of Cunningham, Carson, Messinger, and Carson, and have been a member of that firm, formerly known as Cunningham and Carson, for more than 22 years. I have practiced law in Phoenix, Ariz., for more than 25 years. I have served as deputy county attorney of Maricopa County, Ariz.; as city attorney of the city of Phoenix; as a special assistant attorney general of the State of Arizona; and as counsel for the Colorado River Commission of Arizona. I have also served as a special attorney in the Lands Division of the Department of Justice, in connection with acquisition of properties in Arizona for the United States during the war. I also served as a member of the enemy alien hearing board of Arizona during the war. I also served as a member of the board of bar examiners of Arizona, as a member of the commission appointed by the supreme court of Arizona to integrate the State bar of Arizona; and I served for some 14 years as a member of the board of governors of the State bar of Arizona, and was twice president of the State bar of Arizona. I am now, and have been since 1934, admitted to practice in the Supreme Court of the United States; I have served on various committees for revision of rules of procedure in Federal and State courts, and on various committees of the American Bar Association. I began the practice of law in Phoenix in the offices of Judge John C. Phillips, who later became Governor of Arizona, and of Judge W. S. Norviel, who was Arizona's compact commissioner and who signed on behalf of Arizona the Colorado River compact in 1922.

I became very much interested in the Colorado River question at that time; but I was not employed in a professional capacity on the matter until early in 1933. I served as a special assistant attorney general and as counsel for the Colorado River Commission of Arizona from 1933 to 1935. While I was not thereafter employed professionally until the latter part of 1941 or early 1942, I was during all those years, at various times, called upon for advice to the Colorado River Commission, to the governor, and to the legislature of Arizona. I was employed by the Colorado River Commission from 1942 until it was abolished by act of the legislature in 1945. Thereafter, I was retained directly by the governor's office until the present Arizona Interstate Stream Commission was created early in 1948. Since that time, I have been and now am chief counsel for the Arizona Interstate Stream Commission and special attorney for the State of Arizona on Colorado River matters and adviser to the governor of Arizona on Colorado River matters. However, I am paid for such services only by the Arizona Interstate Stream Commission.

Of course, I have very carefully studied the hostory of the Colorado River question, and have been active in it since 1933.

I believe it would be helpful if I very briefly reviewed the history of the matter, dividing that history into four periods; first, prior to 1922, when the Colorado River compact was signed; second, from the signing of the Colorado River compact to the passage of the Boulder Canyon Project Act in December 1928; third, from the passage of the Boulder Canyon Project Act in 1928 to March 1939, when the Arizona Legislature offered to California and Nevada a compact in the terms prescribed by the Boulder Canyon Project Act; and fourth, from 1939 to date.

Prior to 1900, when Arizona was a sparsely inhabited Territory, the California Development Co. obtained rights good under California law to divert 10,000

cubic feet per second of the waters of the Colorado River for use in Mexico and the Imperial Valley of California through the Alamo canal, which ran through Mexico and back into the Imperial Valley.

The development of the Imperial Valley of California and adjacent portions of Mexico was undertaken by the same promoters as one project. However, in Mexico they were required to organize a Mexican corporation known as the Sociedad de Irrigacion y Terrenos de las Baja California, S. A., all of the stock of which was owned by the original promoters of irrigation in Mexico and the Imperial Valley, and all of the stock of which was later transferred to the officers of the Imperial Irrigation District of California when that district upon its organization took over the property and rights of the California Development Co. Such stock was so held in 1945 by the officers of the Imperial Irrigation District, as testified to by them in the hearings on the treaty with Mexico, which were held before the Committee on Foreign Relations of the United States Senate early in 1945. That company was required by the Mexican Government to and did enter into an agreement with that Government which provided that half of the water carried through the Alamo canal to which the water rights had been established for diversion in California of 10,000 cubic feet per second, would be delivered for use to irrigate all lands susceptible to irrigation in Lower California in Mexico. Assuming continuous flow, the water thus contracted by the promoters of the Imperial Valley, the obligations and rights of which were taken over by the Imperial Irrigation District of California, required delivery for use in Mexico of 3,600,000 acre-feet of the waters of the Colorado River. The Imperial Irrigation District of California and its predecessors charged varying sums through the years for rental of the diversion works at Rockwood Heading and Hanlon Heading and so much an acre-foot for the water delivered for use in Mexico.

That practice continued at least until early 1945, as testified to by Mr. Hewes, the president of the Imperial Irrigation District; Mr. M. J. Dowd, at that time chief engineer and manager of the irrigation district and now a consulting engineer for that district; and Mr. Phil Swing, who was then an attorney representing California interests and who had been attorney for the Imperial Irrigation District.

The provisions concerning the contract with Mexico were presented by Mr. Frank Clayton, attorney for the United States section of the International Boundary Commission, on page 178 of part 1 of the hearings on the treaty with Mexico in 1945, and are matters of record. The testimony of Mr. Swing concerning the sale of water to Mexico is set forth at pages 401, 402, 483 of part 2 of the same hearings.

At that hearing Mr. Hewes produced a copy of the proposal that the Imperial Irrigation District had made to the Mexican Government to sell water to Mexico, by delivery to Mexico through the All-American Canal, which proposal is in the record of the hearings on the Mexican water treaty at pages 1644–1646 of part 5.

The proposal was made in the year 1941, and Mr. Hewes testified that unless the treaty was made reducing Mexico's claim to the waters of the river the Imperial Irrigation District proposed to make some such arrangement with Mexico (p. 1648, pt. 5, Mexican water treaty).

In the Arizona Enabling Act, under which Arizona was admitted as a State, the United States reserved all dam sites and rights-of-way on both sides of the Colorado River across Arizona; and the State, in the constitution adopted, agreed to such reservation.

In 1922 the Colorado River compact was signed at Santa Fe, N. Mex., with its terms as set out.

HISTORY, 1922–28

Following the signing of the Colorado River compact, Arizona tried to work out with California and Nevada a tri-State compact which would carry out the understanding that had been reached between them before Mr. Norviel signed the compact for Arizona, that immediately after its signing a tri-State compact between California, Nevada, and Arizona would be executed, providing that the million acre-feet of III (b) water set forth in the compact was for the exclusive beneficial consumptive use of Arizona to compensate Arizona for the inclusion of the Gila system in the over-all definition of the Colorado River system, which agreement California refused to make. It is only fair to say that Arizona at that time, and I submit with justification, believed that Arizona was entitled to the use of the waters of the Gila River, and in addition thereto to the use of an amount equal to the use in California of the main stream of the Colorado River.

This they believed to be true, and I submit with justification, for the reason that Arizona then had and now has a great deal of excellent land that could be irrigated if the water were available; and in view of the further fact that California contributes practically no water to the Colorado River and has only some 3,500 square miles in the natural basin of the Colorado River, whereas Arizona contributes large quantities to the Colorado River, and has some 103,000 square miles, practically the entire State, in the natural basin of the Colorado River.

During that period various attempts were made to negotiate, and all attempts failed. Then in 1927 at a meeting of the governors of the seven States of the basin, in Denver, Colo., Governor Young of California suggested an informal arbitration between Arizona, California, and Nevada. The four governors of the upper division States, Adams of Colorado; Emerson of Wyoming; Dillon of New Mexico, and Dern of Utah; undertook such informal arbitration; and they made a finding which is set out at page 232 in my testimony on S. 1175, which is a part of the record of this committee, and at page 378 of part 2 on the hearings on H. R. 5434. They recommended settlement, but their recommendation was not accepted by California. It has always been my understanding that it was accepted by the Arizona representatives at that conference. The recommended settlement provided that Nevada should have 300,000 acre-feet, California 4,200,000 acre-feet, and Arizona 3,000,000 acre-feet from the main stream of the Colorado River, and that Arizona should have the exclusive beneficial consumptive use of the Gila River, in addition to the quantities mentioned from the main stream of the river.

It will be noted that the proposed settlement cut down Arizona's claim to mainstream water from 3,600,000 acre-feet to 3,000,000 acre-feet. It has been testified in some of these hearings by California witnesses that Arizona agreed to accept that award conditioned only upon a further provision that the waters of the Gila should never be subject to diminution by any treaty demands of Mexico. If that be true, however, that condition was incorporated in the Boulder Canyon Project Act and was accepted by the Congress.

The provisions of section 4 (a) of the Boulder Canyon Project Act were adopted by the Congress from the recommendations made by the four governors of the upper division States, except that Congress took 200,000 acre-feet from Arizona and added it to California, making the congressional apportionment 300,000 acre-feet to Nevada, 4,400,000 acre-feet to California, and 2,800,000 acre-feet to Arizona. I submit that the provisions of 4 (a) make it clear that such was the intent of Congress, and that Congress required California to accept such division by requiring California as a condition to the effectiveness of the Boulder Canyon Project Act and the construction of the works therein authorized, to adopt the California Self-Limitation Act, which California did adopt in March 1929, by act of its legislature, irrevocably and unconditionally agreeing with the United States and I say with the Congress of the United States, since the reciprocal legislation amounted to a legislative compact for the benefit of the other States of the basin, made through the agency of the Congress of the United States, "That the aggregate annual consumptive use (diversions less returns to the river) of water of and from the Colorado River for use in the State of California, including all uses under contracts made under the provisions of the act, and all water necessary for the supply of any rights which may now exist, shall not exceed 4,400,000 acre-feet of the waters apportioned to the lower basin States by paragraph (a) of article III of the Colorado River compact, plus not more than one-half of any excess or surplus water unapportioned by said compact, such uses always to be subject to the terms of said compact."

HISTORY, 1928–39

Following the passage of the Boulder Canyon Project Act, Arizona filed an action in the Supreme Court of the United States attacking the constitutionality of that act. No allegations concerning the waters of the Gila River were material in that action, and indeed California had not at that time, and did not until approximately 1944, to my knowledge, make any claim that beneficial consumptive use of water was not measurable by the resulting depletion of the main stream of the Colorado; so any allegations made in that action or statements in briefs in that action by either side were not material to any questions here presented, and were made without any consideration being given to the questions now raised by California as to whether or not III(b) water is apportioned water to the lower basin, and as to whether or not consumptive use should be measured by depletion of the main stream of the Colorado River, and were not considered in either con-

nection. It is therefore entirely unfair for California now to claim that they relied upon such irrelevant, immaterial, and inadvertent statements on either side.

The Supreme Court upheld the constitutionality of the act, and also specifically upheld the constitutionality of the provisions of section 13 (c) and (d), which provided that all rights-of-way across Federal lands, and remember, that in the Enabling Act and in the Constitution of Arizona the United States had reserved all rights-of-way clear across the State of Arizona on both sides of the Colorado River, for the use of which such rights-of-way were necessary or convenient to the use of the waters of the Colorado River, or for the generation or transmission of electrical energy generated by the Colorado River, should be on the express condition and with the express covenant that the rights of the users of such waters should be subject to and controlled by the Colorado River compact, and that such conditions and covenants attach and run with the right to use water and attach as a matter of law whether set out or referred to in the instrument evidencing such right-of-way and other privileges from the United States or not.

The Boulder Canyon Project Act is also unique in another particular in that it provided in section 13 (b) that the rights of the United States as well as the rights of those claiming under the United States in or to waters of the Colorado River and its tributaries, shall be subject to and controlled by the Colorado River compact.

The act is also unique in another respect in that section 5 provides that no person shall have or be entitled to have the use for any purpose of any waters stored in Lake Mead except by contract with the Secretary of the Interior. Section 5 also authorizes the Secretary of the Interior, under such general regulations as he may prescribe, to contract for the storage of water in Lake Mead and for the delivery thereof to such points on the river as may be agreed upon.

In 1929 and 1930 further attempts were made to negotiate a compact between Arizona, California, and Nevada, but failed. It is my understanding, although I did not participate in those negotiations and have no personal knowledge thereof, that the only claim there asserted, and which is here asserted by California contrary to the Arizona position, was that the million acre-feet mentioned in article III (b) of the Colorado River compact was unapportioned or surplus water. Another interesting fact in connection with the case that was filed by Arizona attacking the constitutionality of the Boulder Canyon Project Act (283 U. S. 423), is that notwithstanding the fact that Arizona at that time was disputing the constitutionality of the act and opposed appropriation for the construction of Hoover Dam, and that California, Arizona, and Nevada had been unable to agree to the terms of the tri-State compact as set out in the Boulder Canyon Project Act, and notwithstanding the fact that Arizona had filed the suit attacking the constitutionality of the act and California's right to the water set out in the act, the California agencies proceeded to negotiate the California intrastate priorities agreement and negotiated contracts with the Secretary of the Interior, Mr. Wilbur, with his assistant, Northcutt Ely (who now represents California interests), without waiting for the decision of the Court in that case, and moved to dismiss the case.

In my judgment, the Court properly dismissed the case; and the reason it dismissed the case would still prevail in any such case as California now desires to bring. I quote from the decision, next to the last paragraph appearing on page 463 of 283 U. S.:

"When the bill was filed, the construction of the dam and reservoir had not been commenced. Years must elapse before the project is completed. If by operations at the dam any then perfected right of Arizona, or of those claiming under it, should hereafter be interfered with, appropriate remedies will be available. Compare *Kansas* v. *Colorado* (106 U. S. 46, 117). the bill alleges, that plans have been drawn and permits granted for the taking of additional water in Arizona pursuant to its laws. But Wilbur threatens no physical interference with these projects; and the act interposes no legal inhibitions on their execution. There is no occasion for determining now Arizona's rights to interstate or local waters which have not yet been, and which may never be, appropriated. *New Jersey* v. *Sargent* (269 U. S. 328, 338). This court cannot issue declaratory decrees. Compare *Texas* v. *Interstate Commerce Commission* (258 U. S. 158, 162); *Liberty Warehouse Co.* v. *Grannis* (273 U. S. 70, 74); *Willing* v. *Chicago Auditorium Association* (277 U. S. 274, 289–290). Arizona has, of course, no constitutional right to use, in aid of appropriation, any land of the United States, and it cannot complain of the provision conditioning the use of such

public land. Compare *Utah Power & Light Co.* v. *United States* (243 U. S. 389, 403–405)."

Following the failure in 1929 and 1930 to reach any agreement with California, and following the decision of the Supreme Court of the United States in 283 United States, Arizona appropriated and spent considerable sums of money in making engineering investigations and studies and reports, the people of Arizona having reached the conclusion prior to that time that it was essential to divert water from the main stream of the Colorado River into central and southern Arizona.

When I was first retained as a lawyer by the Colorado River Commission of Arizona in 1933, I was requested to and did write legal opinions on Arizona's rights to water of the main stream of the Colorado River and possible courses of action to secure those rights. California had for the first time in the negotiations in 1929 and 1930 made the claim that the million acre-feet of III (b) water mentioned in the Colorado River compact was unapportioned by that compact and was hence part of the surplus that could be used in California. I was requested for an opinion, and gave it as my opinion that under the Colorado River compact and the California self-limitation statute, which had been enacted in 1929, California was precluded from claiming any rights in the millon acre-feet of III (b) water by the terms of the California self-limitation statute, because in my opinion the million acre-feet of III (b) water was apportioned to the lower basin, although not specifically to Arizona alone. It will be remembered that California had refused to carry out the understanding of the original compact commissioners that a tri-State compact between California, Nevada, and Arizona would provide that the million acre-feet of III (b) water was for the exclusive beneficial use of Arizona in compensation for the inclusion of the Gila River in the over-all definition of the Colorado River system. The Colorado River Commission of Arizona, while it agreed with my opinion, wanted, if possible, to have that point settled and determined authoritatively by the Supreme Court of the United States. Accordingly, I prepared and filed a bill asking leave to perpetuate testimony of the understanding which had been reached at Santa Fe, N. Mex., before the Colorado River compact was signed. The Court in the sixth ground of its opinion set forth at pages 358–359 of *Arizona* v. *California* (292 U. S. 341), held that the III (b) water was apportioned to the lower basin. I quote the sixth ground of the opinion:

"Sixth. The considerations to which Arizona calls attention do not show that there is any ambiguity in article III (b) of the compact. Doubtless, the anticipated physical sources of the waters which combine to make the total of 8,500,000 acre-feet are as Arizona contends, but neither article III (a) nor (b) deal with the waters on the basis of their source. Paragraph (a) apportions waters 'from the Colorado River system,' i. e., the Colorado and its tributaries and (b) permits an additional use 'of such waters.' The compact makes an apportionment only between the upper and lower basin; the apportionment among the States in each basin being left to later agreement. Arizona is one of the States of the lower basin and any waters useful to her are by that fact useful to the lower basin. But the fact that they are solely useful to Arizona, or the fact that they have been appropriated by her, does not contradict the intent clearly expressed in paragraph (b) (nor the rational character thereof) to apportion the 1,000,000 acre-feet to the States of the lower basin and not specifically to Arizona alone. It may be that, in apportioning among the States the 8,500,000 acre-feet allotted to the lower basin, Arizona's share of waters from the main stream will be affected by the fact that certain of the waters assigned to the lower basin can be used only by her; but that is a matter entirely outside the scope of the compact.

"The provision of article III (b), like that of article III (a) is entirely referable to the main intent of the compact which was to apportion the waters as between the upper and lower basins. The effect of article III (b) (at least in the event that the lower basin puts the 8,500,000 acre-feet of water to beneficial uses) is to preclude any claim by the upper basin that any part of the 7,500,000 acre-feet released at Lee Ferry to the lower basin may be considered as 'surplus' because of Arizona waters which are avilable to the lower basin alone. Congress apparently expected that a complete apportionment of the waters among the State of the lower basin would be made by the subcompact which it authorized Arizona, California, and Nevada to make. If Arizona's rights are in doubt it is, in large part, because she has not entered into the Colorado River compact or into the suggested subcompact."

It is held that there was no ambiguity and that it was apportioned water to the lower basin by the express language of the compact and the Boulder Canyon Project Act.

It is therefore clear that it is not any part of the unapportioned or surplus water, and that California by adopting her Self-Limitation Act has forever excluded herself from claiming any part of it.

During that period 1933–35 I was also requested for a legal opinion as to whether or not Arizona could maintain an action in the Supreme Court of the United States seeking an equitable apportionment of the waters available to the lower basin. I gave it as my opinion that Arizona could not do so because she was not making use of any waters upon which the jurisdiction of the Court might rest. In other words, Arizona could not allege any injury or threatened injury to any existing use of water; and hence there was no justiciable controversy. I therefore advise against and did not participate in the case of *Arizona* v. *California* reported in 298 U. S. 558. In that case California objected to the filing of the bill on two grounds. As stated by the Court:

"* * * The returns raise numerous objections to the sufficiency of the proposed bill of complaint, only two of which we find it necessary to consider. One is that the proposed bill fails to present any justiciable case or controversy within the jurisdiction of the Court. The other is that the United States, which is not named as a defendant and has not consented to be sued, is an indispensable party to any decree granting the relief prayed by the bill.

"The relief sought is: (1) that the quantum of Arizona's equitable share of the water flowing in the Colorado River, subject to diversion and use, be fixed by this Court, and that the petitioner's title thereto be quieted against adverse claims of the defendant States. (2) That the State of California be barred from having or claiming any right to divert and use more than an equitable share of the water flowing in the river, to be determined by the Court, and not to exceed the limitation imposed upon California's use of such water by the Boulder Canyon Project Act (45 Stat. 1057), and the act of the California Legislature of March 4, 1929 (Ch. 16, Stat. of Calif., 1929, p. 38). (3) That it be decreed that the diversion and use by any of the defendant States of any part of the equitable share of the water decreed to Arizona pending its diversion and use by her shall not constitute a prior appropriation or confer upon the appropriating State any right in the water superior to that of Arizona. (4) That any right of the Republic of Mexico to an equitable share in any increased flow of water in the Colorado River made available by works being constructed by or for California, shall be supplied from California's equitable share of the water, and that neither petitioner nor the defendant States other than California shall be required to contribute to it from their equitable shares as adjudicated by the Court.

"The proposed bill thus, in substance, seeks a judicial apportionment among the States in the Colorado River Basin of the unappropriated water of the river, with the limitation that the share of California shall not exceed the amount to which she is limited by the Boulder Canyon Project Act and by her statute, and with the proviso that any increase in the flow of water to which the Republic of Mexico may be entitled shall be supplied from the amount apportioned to California. Our consideration of the case is restricted to an examination of the facts alleged in the proposed bill of complaint and of those of which we mak take judicial notice."

The Court upheld both grounds of the motion to dismiss referred to in the above quotation; that is, the Court held that there was no justiciable controversy because there was no injury or threat of injury. And it also held that in that character of action seeking an equitable apportionment for future use of the United States is an indispensable party defendant and was not joined. The Court in the course of its opinion said (P. 570):

"The decree sought has no relation to any present use of the water thus impounded which infringes rights which Arizona may assert subject to superior but unexpected powers of the United States. Cf. *Wisconsin* v. *Illinois* (278 U. S. 367); see *Arizona* v. *California*, supra, 464; *United States* v. *Arizona*, supra, 183, * * *"

In the meantime, Hover Dam was rapidly nearing completion, and we in Arizona were very much concerned over the increase in the use of waters in Mexico made possible with the encouragement, assistance, and to the financial benefit of the Imperial Irrigation District of California.

91190—49—ser. 11, pt. 1——34

Arizona had tried in 1925 and 1927 to get the United States to notify Mexico that the United States would never recognize any right in Mexico to use any greater quantity of water of the Colorado River than Mexico was then using. California refused to join in that effort.

Again in 1933 Arizona made an effort to persuade the United States to notify Mexico that no greater use of the waters of the Colorado River than Mexico was then making would be recognized by the United States. Again California refused to joint in the effort, and Arizona was on both occasions unable to persuade the State Department to give Mexico any such notice.

Finally, the people of Arizona recognized that Arizona was in grave jeopardy, mainly from the increasing and potentially very large uses of water which would be made in Mexico to the financial profit of the Imperial Irrigation District of California, and also by virtue of the fact that Arizona had been unable to secure the construction of any works in Arizona for the use of any water of the Colorado River and California was building works to take more than the 4,400,000 acre-feet of apportioned water to which California had forever limited herself. We realized that by virtue of the decision of the Supreme Court of the United States in 292 U. S. 341, the million acre-feet of III (b) water had been held to be apportioned water and hence no part of the surplus. Therefore, by the California Self-Limitation Act California was precluded from claiming any part of it. Arizona recognized that it would not be able to get any water or to utilize water from the main stream of the Colorado River under conditions laid down by Congress until it ratified the Colorado River compact. Arizona desired to make the tri-State compact between Arizona, California, and Nevada authorized by the Boulder Canyon Project Act. Accordingly, I helped write chapter 33 of the Session Laws of Arizona of 1939, which was adopted by the legislature and approved by the Governor, March 3, 1939.

By that time California had begun to assert, for the first time so far as I am aware, that the word "and" in the second paragraph of section 4 (a) of the Boulder Canyon Project Act was not a conjunction, and therefore did not mean "in addition to." So in the 1939 act we made it clear that in our opinion the word "and" in the second paragraph of section 4 (a) of the act did mean "in addition to."

For purposes of comparison, the provisions of article III of the tri-State compact offered by the Legislature of Arizona to California and Nevada is here set out as follows:

"ARTICLE III

"(a) The aggregate annual consumptive use (diversions less returns to the river) of water of and from the Colorado River for use in the State of California, including all uses under contracts made under the provisions of the Boulder Canyon Project Act and all waters necessary for the supply of any rights which may now exist, shall not exceed 4,400,000 acre-feet of the waters apportioned to the lower-basin States by paragraph (a) of article III of the Colorado River Compact, plus not more than one-half of any excess or surplus waters unapportioned by said Colorado River compact.

"(b) Of the 7,500,000 acre-feet annually apportioned to the lower basin by paragraph (a) of article III of the Colorado River compact, there is hereby apportioned annually to the State of Nevada 300,000 acre-feet and annually to the State of Arizona 2,800,000 acre-feet for the exclusive beneficial consumptive use by said States of Nevada and Arizona, respectively, in perpetuity.

"(c) The State of Arizona may annually use one-half of the excess or surplus waters unapportioned by the Colorado River compact.

"(d) In addition to the water covered by paragraphs (b) and (c) hereof, the State of Arizona shall have the exclusive beneficial consumptive use of the Gila River and its tributaries within the boundaries of the State of Arizona in perpetuity.

"(e) The waters of the Gila River and its tributaries, except return flow after the same enters the Colorado River, shall never be subject to any diminution whatever by any allowance of water which may be made by treaty or otherwise to the United States of Mexico, but if, as provided in paragraph (c) of article III of the Colorado River compact, it shall become necessary to supply water to the United States of Mexico from waters over and above the quantities which are surplus as defined by said Colorado River compact, then the State of California shall and does mutually agree with the State of Arizona to supply,

out of the main stream of the Colorado River, one-half of any deficiency which must be supplied to Mexico by the lower basin.

"(f) Neither the States of Arizona, California, nor Nevada will withhold water nor require the delivery of water which cannot reasonably be applied to domestic and agricultural uses.

"(g) All the provisions of this compact or agreement shall be subject in all particulars to the provisions of the Colorado River compact."

I next set out the exact language of section 4 (a) of the Boulder Canyon Project Act, which is as follows:

"SEC. 4. (a) This act shall not take effect and no authority shall be exercised hereunder and no work shall be begun and no moneys expended on or in connection with the works or structures provided for in this act, and no water rights shall be claimed or initiated hereunder, and no steps shall be taken by the United States or by others to initiate or perfect any claims to the use of water pertinent to such works or structures unless and until (1) the States of Arizona, California, Colorado, Nevada, New Mexico, Utah, and Wyoming shall have ratified the Colorado River compact, mentioned in section 13 hereof, and the President by public proclamation shall have so declared, or (2) if said States fail to ratify the said compact within 6 months from the date of the passage of this act then, until six of said States, including the State of California, shall ratify said compact and shall consent to waive the provisions of the first paragraph of article XI of said compact, which makes the same binding and obligatory only when approved by each of the seven States signatory thereto, and shall have approved said compact without conditions, save that of such six-State approval, and the President by public proclamation shall have so declared, and, further, until the State of California, by act of its legislature, shall agree irrevocably and unconditionally with the United States and for the benefit of the States of Arizona, Colorado, Nevada, New Mexico, Utah, and Wyoming, as an express covenant and in consideration of the passage of this act, that the aggregate annual consumptive use (diversions less returns to the river) of water of and from the Colorado River for use in the State of California, including all uses under contracts made under the provisions of this act and all water necessary for the supply of any right which may now exist, shall not exceed 4,400,000 acre-feet of the waters apportioned to the lower-basin States by paragraph (a) of article III of the Colorado River compact, plus not more than one-half of any excess or surplus waters unapportioned by said compact, such uses always to be subject to the terms of said compact.

"The States of Arizona, California, and Nevada are authorized to enter into an agreement which shall provide (1) that of the 7,500,000 acre-feet annually apportioned to the lower basin by paragraph (a) of article III of the Colorado River compact, there shall be apportioned to the State of Nevada 300,000 acre-feet and to the State of Arizona 2,800,000 acre-feet for exclusive beneficial consumptive use in perpetuity, and (2) that the State of Arizona may annually use one-half of the excess or surplus waters unapportioned by the Colorado River compact, and (3) that the State of Arizona shall have the exclusive beneficial consumptive use of the Gila River and its tributaries within the boundaries of said State, and (4) that the waters of the Gila River and its tributaries, except return flow after the same enters the Colorado River, shall never be subject to any diminution whatever by any allowance of water which may be made by treaty or otherwise to the United States of Mexico but if, as provided in paragraph (c) of article III of the Colorado River compact, it shall become necessary to supply water to the United States of Mexico from waters over and above the quantities which are surplus as defined by said compact, then the State of California shall and will mutually agree with the State of Arizona to supply, out of the main stream of the Colorado River, one-half of any deficiency which must be supplied to Mexico by the lower basin, and (5) that the State of California shall and will further mutually agree with the States of Arizona and Nevada that none of said three States shall withhold water and none shall require the delivery of water, which cannot reasonably be applied to domestic and agricultural uses, and (6) that all of the provisions of said tri-State agreement shall be subject in all particulars to the provisions of the Colorado River compact, and (7) said agreement to take effect upon the ratification of the Colorado River compact by Arizona, California, and Nevada."

I leave it to the committee that the "and" before (3) as set out in the act and hereinbefore quoted means that it was the intent of Congress that Arizona should have the use of 2,800,000 acre-feet of main-stream water plus one-half of

any excess or surplus waters unapportioned by the Colorado River compact which might be available in the lower basin, and in addition thereto that the State of Arizona should have the exclusive beneficial consumptive use of the Gila River and its tributaries within the boundaries of said State.

The legislature of Arizona made a firm offer of such compact setting out its terms and provided that if it were approved within a total of 2 years thereafter the Colorado River compact should thereupon be and become by the terms of the said chapter 33 ratified for and on behalf of the State of Arizona.

I did not participate in any negotiations with California following the passage of that act, but I am informed that California refused to make such compact, and that no question of any claim that beneficial consumptive use of water should be measured in any way other than by the resulting depletion of the Colorado River, and no question of any claim that California should not bear pro rata her share of evaporation losses were brought up, which points are urged by California witnesses now.

1939 TO DATE

Following California's refusal to make such compact, I was requested by the Colorado River Commission of Arizona and by the Governor of Arizona, under an act of the legislature authorizing it, to attempt to negotiate with the Secretary of the Interior a contract for the delivery of Arizona's share of main-stream water for use in Arizona, which act provided that upon the ratification of such a contract the Colorado River compact would be ratified by Arizona. I had attempted to negotiate such a contract in 1933–35. But California and the other basin States had opposed it on the ground that Arizona was not a party to the Colorado River compact. California did not advance any theory as to the measurement of beneficial consumptive use other than by the resulting depletion of the Colorado, nor did it advance any claim that it should not bear the proportionate share of evaporation losses caused by storage of water for her benefit.

After long negotiations in the committees of 14 and 16, which at that time represented all seven States of the Colorado River Basin, and at all of the meetings at which California interests were well represented, the contract to be executed by the State of Arizona and the Secretary of the Interior was approved by all of the States of the basin except California. Nevada aided Arizona in negotiating that contract as did the other States of the basin, and Arizona helped Nevada negotiate with the approval of the other States the Nevada contract.

That contract is in evidence before you and is incorporated in the hearings on S. 1175, at page 240. It was signed on February 9, 1944; and during the same month it was ratified by the legislature of the State of Arizona. The Colorado River compact was also ratified by that legislature.

THE MEXICAN WATER TREATY

The Mexican water treaty was negotiated by the State Department and Mexico after numerous conferences with the committees of 14 and 16 representing the seven States of the Colorado River Basin, and it was signed February 3, 1944. The States of Colorado, Wyoming, Utah, New Mexico, and Arizona supported the treaty. California opposed, and was joined by the State of Nevada after the signing of the treaty.

In 1943 Mexico had increased her uses of the waters of the Colorado River, with the encouragement and aid, and to the financial profit, of the Imperial irrigation district of California, to 1,800,000 acre-feet per annum. Our engineers stated that there are approximately a million acres of land in Mexico which could be readily irrigated with the waters of the Colorado River; and we felt that unless an over-all all-time limit to the Mexican claims of the Colorado River to the lowest possible limit could be fixed by treaty with Mexico immediately Mexico might increase her uses to some five or six million acre-feet of water and then invoke the provisions of the inter-American treaty of arbitration, which had been ratified in 1935. We felt that unless immediate settlement was made by treaty and agreement with Mexico, Mexico might at some future time assert claim to the quantity of water which she was using at such future time.

By the year 1940 Hoover Dam had been completed and was filled. In 1941, according to the engineers of Arizona, the Colorado River waters flowed across the Mexican border in the quantity of 12,891,900 acre-feet. In 1942 it was in the amount of 11,748,900 acre-feet, and in 1943 10,667,200 acre-feet. It was back up close to the run-off prior to the construction of Hoover Dam and Mexico was rapidly increasing her uses.

I testified for Arizona on the treaty hearings before the Foreign Relations Committee in 1945 (pp. 248–307). I filed in that hearing a condensed statement of Arizona's position, which appears on pages 301–307 of volume 1. During that same hearing Mr. Phil Swing, representing California interests, testified on pages 401, 402, and 438 of volume 2. Mr. M. J. Dowd, chief engineer and manager of the Imperial irrigation district at that time, testified on page 713, volume 3, of that hearing; and Mr. Evan T. Hewes, president of the Imperial irrigation district, testified on pages 1644–1652 of volume 5 of the hearings as to the revenues that the Imperial irrigation district and its subsidiary in Mexico obtained through the delivery of water of the river to Mexico. Mr. Hewes produced and there is in the record at page 1644 of volume 5 a proposal made by the Imperial irrigation district to the Mexican Government on its own behalf, and on behalf of its subsidiary in Mexico, dated June 11, 1941, for a further arrangement for the delivery by the Imeprial irrigation district and its Mexican subsidiary of water of the Colorado River for use in Mexico. On page 1652 of volume 5, Mr. Frank Clayton, attorney for the United States section of the International Boundary Commission (now the International Boundary and Water Commission) gave a translation and analysis of the proposal, which indicated that under the plan set out in the proposal the Imperial irrigation district would receive an annual payment, for 20 years, of approximately $470,000, and thereafter in perpetuity approximately $340,000 a year; and that under plan No. 2 in the proposal of the Imperial irrigation district it would receive approximately $628,000 a year.

Mr. Hewes stated on page 1948 of volume 5 of the hearings, in answer to question by Senator Austin, that if the Mexican water treaty were not ratified the Imperial irrigation district would make some such arrangement with Mexico.

In the Seventy-ninth Congress and in the Eightieth Congress California interests introduced bills, which, in my judgment and in the judgment of the Colorado River Basin States committee, and I believe in the judgment of the State Department and of the Interior Department, would have the effect of rendering nugatory and abrogating the Mexican water treaty, and thus releasing Mexico from the all-time limit placed upon her claim to the waters of the river by that treaty.

I do not know whether such a bill has been introduced in the Eighty-first Congress; I am informed, however, that the Imperial irrigation district is trying to secure by other means the control of the running of water through the All-American Canal to Mexico.

In 1944 before the committee of 14 and 16 and in the hearings on the Mexican treaty before the Senate Foreign Relations Committee in 1945, it was openly argued by some of the representatives of southern California interests that if that treaty were ratified they would bring an action in the Supreme Court of the United States to set aside the Colorado River compact and the California Self-Limitation Act. None of the representatives of the other States believed that they could be successful in any such action.

In the hearings on the Gila reauthorization bill before the House Committee on Irrigation and Reclamation, California still persisted, in spite of the opinion of the Supreme Court of the United States in 292 U. S. 341, to state that the million acre-feet of III (b) water was unapportioned and hence part of the surplus, in which California could have an interest, nothwithstanding the provisions of the California self-limitation statute. California also presented its argument that resulting depletion of the Colorado River was not the proper method of measuring beneficial consumptive use of the water as between States, and further presented its argument that California should not bear its proportionate share of the reservoir losses caused by the storage of water for its benefit.

In 1946 shortly after the hearings on the Gila reauthorization bill, California withdrew from the committees of 14 and 16, which for many years had been the forum for discussion of the Colorado River matters between the States of the basin, and California severed diplomatic relations with the States of the basin. The name of the committee was changed to the Colorado River Basin States committee. Shortly thereafter, Nevada followed California by withdrawing from the committee severing diplomatic relations with the remaining five States of Arizona, Colorado, Wyoming, Utah, and New Mexico.

It was true that from 1933 to 1937, when the Colorado River Board of California was created, that southern California men representing one or another of the California agencies of southern California which claimed rights in the Colorado River, appeared at all interstate meetings concerning the river and spoke in the interests of their respective agencies.

In 1937 the Legislature of California created the Colorado River Board of California, and restricted its membership to representatives of the California agencies. The agencies were the Palo Verde irrigation district, the Imperial valley district, Coachella Valley County water district, the Metropolitan water district of southern California, the Department of Water and Power of the city of Los Angeles, and the city of San Diego. It is my understanding that the representatives of those agencies who signed the intrastate priorities agreement in California, are still acting in the interests of their respective agencies and trying to carry out their interagency priorities agreement which was signed by them on August 18, 1931; and that they feel bound to each other by that agreement, although they do not apparently feel bound by the California self-limitation statute.

Later, after having, in my opinion, somewhat belatedly determined that they should not bring an action attacking the validity of the Colorado River compact and the California self-limitation statute they gave lip service to those documents; and yet by strained constructions and twisting of words, they tried to avoid their plain meaning. Therefore, they have thought up the strained constructions and distortions which are now being presented to Congress as substantial controversies requiring immediate adjudication, in spite of the solemn agreements of their State and the plain meaning of those agreements.

The late Gov. Sidney P. Osborn, who was Governor of Arizona from 1941 until the last of May 1948 when he died, told me that he many times during the course of his gubernatorial career tried to talk to Gov. Earl Warren, of California, about Colorado River matters, but that he was always informed in those oral conversations with Governor Warren that he would not discuss it, that Arizona would have to see the Colorado River Board of California, every member of which represents one of the southern California agencies—which apparently feel bound to one another rather than by the solemn agreements of the State of California.

I myself tried to talk to Governor Warren as the representative of Arizona one time at the governors conference in Seattle, but he would not discuss the Colorado River or the position of California or of Arizona.

California witnesses have called attention to two letters, one by Gov. Earl Warren to Governor Osborn, and the other Governor Osborn's answer thereto. They fail to refer to the whole series of letters exchanged between our two governors. There were six letters in the series, which are set forth on pages 229–233 of the hearings on Senate Joint Resolution 145 before a subcommittee of this committee in May of last year and on pages 467–472 of the hearings on House Joint Resolution 225. I request that the committee read the whole correspondence where Governor Warren himself, over his own signature, completely refutes the statements in the press and inferences of representatives of these southern California interests, that Governor Osborn would not talk with Governor Warren.

Governor Osborn and Governor Warren had worked together in many matters of mutual interest to their respective States at numerous governors conferences; and I believe the two men were personal friends and respected one another. I am sure that Governor Osborn liked, respected, and had confidence in the ability and fair-mindedness of Governor Warren.

So when he received Governor Warren's letter of March 3 he hoped that it meant that Governor Warren was proposing to reassert the prerogatives of the office of governor of California, and take a personal interest in and endeavor to work out the California-Arizona situation which, as we see it, has been created by the failure of the representatives of the southern California agencies to respect the commitments made by the good people and the sovereign State of California.

Governor Osborn was fair-minded, a student of Colorado River matters, and a great governor. Neither he nor the people of Arizona had, nor have, any desire to hurt California or its people. Arizona and California are neighbors; they are part of the same trade territory. California furnishes our best market and Arizona is one of California's best customers.

Governor Osborn was always forthright, frank and honest in his dealings. On account of his personal relations with Governor Warren and his confidence in Governor Warren, in spite of the fact that Governor Warren had not set forth the basis of any claim that he intended to make for California, Governor Osborn believed that he owed Governor Warren the duty of frankness, and that if they could get to discussing the matter on the high level of governors, he could show

Governor Warren that Arizona's position was correct. Accordingly, he answered Governor Warren's letter of March 3, 1947, on March 12, 1947. Governor Warren did not answer Governor Osborn's letter until May 16, 1947. Governor Osborn answered that letter on May 23, 1947, but received no reply. Governor Osborn wrote Governor Warren again after waiting until October 10, and Governor Warren answered under date of October 16. In order to make this matter clear, I desire now to read to you those letters. They appear in the hearings on Senate Joint Resolution 145 at pages 228 to 233, and in the hearings on House Joint Resolution 225 at pages 467–472. These southern California gentlemen present to these respective committees only the first two of these letters.

You will note that Governor Warren never did take issue with any fact, statement, or conclusion of Governor Osborn's, or set forth the quantity of water that California claimed or intended to claim; or the basis for such claim.

The committees of 14 and 16 had been organized as a governors' committee to be composed of two men from each State, named by and representing directly their respective governors. So I was surprised when the letters withdrawing California representatives from the committee was presented by the Colorado River Board of California. The committee immediately changed its name to the Colorado River Basin States Committee, and requested Governor Warren, of California, to persuade the California men who had been participating in the work of the committee to return to the committee; or, if they refused, to appoint to the committee other California representatives. Governor Warren declined.

At the hearings on S. 1175 in the summer of 1947 these representatives of southern California agencies enlarged upon the arguments they had made in the hearings on H. R. 5434 the preceeding year. I, for Arizona, presented the questions raised by California to the Colorado River Basin States committee. After long and mature consideration, the Colorado River Basin States committee at a meeting at Salt Lake City, Utah, on the second day of October, unanimously adopted the statement which appears on page 155 of the hearings on Senate Joint Resolution 145, and which I would like to read to you at this time. * *

* * * * * * *

The Upper Colorado River Basin Compact Commission had been negotiating since July 1946; and it adopted the principles enunciated in the statement which I have just read to you. The upper Colorado River Basin compact was signed in late 1948, and has now been ratified by each of the five States and consent thereto has been given by the Congress. The Colorado Basin States committee in the statement of principles I have just read to you, found unanimously that the million acre-feet mentioned in article III (b) of the Colorado River compact is apportioned to the lower basin, making the total apportionment to the lower basin 8,500,000 acre-feet; and the lower basin is entitled to deplete the flow of the Colorado River at the international boundary by 8,500,000 acre-feet. It was adopted by the committee the principle that evaporation and reservoir losses should be divided on a ratable and proportionate basis among projects served by such reservoirs. Water stored for future use is on the same basis as diverted water.

In the brief filed in opposition to Senate Joint Resolution 145, appearing in the printed record of those hearings at pages 157–179, and at pages 265–287 of hearings on House Joint Resolution 225, the Colorado River Basin States committee, composed of Judge Clifford H. Stone and Frank Delaney, for the State of Colorado; L. C. Bishop and H. Melvin Rollins, for the State of Wyoming; William R. Wallace and Grover R. Giles for the State of Utah; Fred E. Wilson and John H. Bliss for the State of New Mexico; and Nellie T. Bush and Charles A. Carson for the State of Arizona, with additional members on the subcommittee to oppose litigation, including Judge J. A. Howell for the State of Utah; Martin A. Threet for the State of New Mexico; Norman B. Gray, attorney general of Wyoming; and Jean S. Breitenstein for the State of Colorado, made the flat statement:

"* * * Taking into consideration that Arizona is entitled to all the uses of the Gila River as set out in this paragraph (meaning the second paragraph of sec. 4 (a) of the Boulder Canyon Project Act), this necessarily means that Arizona is entitled in addition thereto to 2,800,000 acre-feet per annum. Which means, further, that there is ample water for the central Arizona project because California does not and cannot assert that that project will take more water than that."

I would like to read a few paragraphs of that brief, beginning on page 174 of the hearings on Senate Joint Resolution 145 * * * and on page 282 of the hearings on House Joint Resolution 225.

It seems to me that the arguments here advanced by California are fully, completely, and devastatingly answered by that portion of that brief which I have read.

I testified very fully before this committee and its subcommittee on S. 1175 and Senate Joint Resolution 145, and before the House committee on House Joint Resolution 225, and I do not believe it is necessary here to repeat its arguments, because I understand thta the full and complete record of the hearings on Senate Joint Resolution 145 and S. 1175 are before this committee for consideration without reprinting. I do believe that the statements made by the witnesses in favor of S. 1175 and in opposition to Senate Joint Resolution 145 are full, complete, and unanswerable.

PRESENT HEARINGS

It has been argued by the representatives of the southern California agencies in the hearings before this committee on S. 75 and more fully in the hearings before the Public Lands Committee on H. R. 934 and H. R. 935, which have been proceeding simultaneously, that Congress does not have the power or jurisdiction, for any purpose, to construe or interpret the Colorado River compact; and therefore that Congress is helpless to determine the question whether or not, in its judgment, there is water legally available for the central Arizona project, for the purpose of the authorization bill. They have argued that consideration of that question by the Congress is precluded and barred, and that the only tribunal having jurisdiction to determine the question of the availability of water for the project is the Supreme Court of the United States.

However, while some of their witnesses have been pressing such arguments in the legislative committees, Mr. James H. Howard, general counsel for the Metropolitan Water District of Southern California, presented a statement before Subcommittee No. 3 of the House Committee on the Judiciary in a hearing on House Joint Resolution 3 and similar resolutions, all of which are companion to Senate Joint Resolution 4, being considered by your committee, in which he conceded that Congress did have such power to determine the availability of water for a project for the legislative purpose of authorizing a project. Mr. Howard stated that in making contracts with the Secretary of the Interior the souhern California agencies had relied upon immaterial and irrelevant allegations in the bill and statements in the pleadings in *Arizona* v. *California* (283 U. S. 423). I thought that Mr. Howard was too careful a lawyer to rely upon such statements, and I checked dates. I find that he must be in error because the bill was not filed in that case until October 13, 1930. I find in the Hoover Dam Contracts, by Wilbur and Ely, published in 1933, copies of a contract for electrical energy executed by the United States, and the Metropolitan Water District of Southern California on April 26, 1930, executed a contract for the delivery of water by the United States to it. Both of said contracts were executed nearly 6 months before the Arizona bill of complaint was filed; so Mr. Howard must be mistaken.

It is Arizona's view that the questions raised by California are completely and conclusively settled by the Boulder Canyon Project Act, the California self-limitation statute, the Colorado River compact, and the Arizona contract, with the one possible question of who shall bear reservoir losses.

In that connection, it should be remembered that that question cannot arise probably for a hundred years, or until the upper basin has completely utilized all of its water and all surplus has disappeared and there occurs a shortage of water available for delivery from Lake Mead. If that time should ever arise, it is in the far, dim, and distant future; and as is the universal practice in the West, deliveries would be curtailed proportionately. In any event, it cannot now give rise to a justiciable controversy, because it may never happen. If there should be such a shortage, and it may never happen, that California should use all of the water conceivably usable by her and Arizona and Nevada should use all of the water set aside for them, deliveries to them would necessarily be reduced proportionately, in accordance with well-recognized principles of equity.

SITUATION AS TO UTAH AND NEVADA

I would like to touch briefly upon the situation of Utah and Nevada and their utilization of their shares of the waters of the Muddy River, the Virgin River, and Kanab Creek, in the lower basin. The Virgin River rises in Utah, flows through Arizona, thence through Nevada, where it enters Lake Mead. The

Muddy River is, as I understand it, entirely within the State of Nevada. Kanab Creek rises in Utah, and flows into Arizona in the lower basin. It appears to us in Arizona that insofar as Nevada and Utah are concerned, and their right to use water of those tributaries is concerned, their best interests require that the beneficial consumptive use of water be measured by the resulting depletion at the mouths of those tributaries, as Arizona contends that it should be measured and as Utah has agreed that it should be measured in the upper Colorado River Basin compact. Of course, Utah cannot properly take one position in the upper basin and a contrary position in the lower basin. However, all the tributaries are wasting streams, as is the Gila River in Arizona and New Mexico. By measuring beneficial consumptive use by the resulting depletion at the mouths of the various tributaries, all users of waters from those tributaries can use greater quantities of water than they could under the California theory of measurement of beneficial consumptive use at points of use, without regard to the effect upon the streams. Therefore, under the Arizona theory that is given above, they can use more water than they could under the California theory.

It appears to us that Nevada's best interests require that Nevada stand with Arizona upon the proposition that reservoir losses should be borne ratably and proportionately by those benefiting from the storage of water for future use, which makes possible such evaporation losses.

The Boulder Canyon Project Act and the California Self-Limitation Act provide "that the aggregate annual consumptive use (diversions less returns to the river) of and from the Colorado River for use in the State of California * * * shall not exceed 4,400,000 acre-feet."

It will be noted that the Boulder Canyon Project Act and the California Self-Limitation Act do not say water diverted into California but diverted for use in the State of California.

Section 5 of the Boulder Canyon Project Act authorized the Secretary of the Interior, under such general regulations as he may prescribe, to contract for the storage of water in the reservoir and the delivery thereof.

The Secretary did provide in the metropolitan water district contract and in the San Diego contract for storage of water in Lake Mead and delivery thereof to such agencies. In their contracts giving them the right of such storage, it is provided as follows:

"* * * provided that accumulations shall be subject to such conditions as to accumulation, retention, release, and withdrawal as the Secretary of the Interior may from time to time prescribe in his discretion, and his determination thereof shall be final: *Provided further*, That the United States of America reserves the right to make similar arrangements with users in other States without distinction in priority, and to determine the correlative relations between said district and/or said city and such users resulting therefrom."

It therefore seems clear to me that the California agencies and the Secretary contemplated in such provisions in accordance with equity, which would require, as is the practice throughout the West, that reservoir losses be shared ratably and proportionately, if that should ever become necessary.

Arizona, in the water-delivery contract, has by contract with the United States, for the benefit of Nevada, recognized the right of Nevada to use 300,000 acre-feet of water; and for the benefit of Utah has recognized the right of Utah to equitable shares of the water in the lower-basin tributaries to which Utah has access. That share has not yet been agreed upon; so for the purpose of this bill, Arizona, in her calculations, has calculated that Utah might be able to use all the water which the Bureau of Reclamation estimates is the total ultimate possible use in Utah, and has deducted the quantities calculated by the Bureau for use in Utah and 300,000 acre-feet for use in Nevada, from the total of the water apportioned to the lower basin, before calculating the quantity available to Arizona.

Arizona has appraised both Utah and Nevada that when they are ready to do so Arizona is prepared to negotiate a compact with them, apportioning the water of the Virgin River and Kanab Creek and, if Nevada desires, the waters of the Big Muddy for use in the States through which such tributaries flow, in such a manner that all of the water of said tributaries, to the greatest extent possible, would be utilized in such tributary basins without regard to the effect of such utilization on the flow of the main stream of the Colorado River, whether or not California should join in such a compact.

No parts of the three States through which such tributaries flow have access to any water except that flowing in such tributaries.

SITUATION AS TO NEW MEXICO

Likewise, Arizona has contracted with the United States to recognize the rights of New Mexico to equitable shares of the water apportioned and unapportioned in the lower basin. Those shares have not yet been fixed in amount; but for the purpose of calculating its water supply for the central Arizona project, Arizona has deducted from the quantity of water apportioned to the lower basin the ultimate possible uses in New Mexico, as estimated by the Bureau of Reclamation. That estimate, of course, is not binding on either of the States; but it is the closest approximation available to us at this time.

The water rights to the Gila River, as between Arizona and New Mexico, have been established by a Federal court decree, over which, of course, the State of Arizona has no control. The waters of the Gila River affected by that decree are fully appropriated, and rights are definitely settled, so that, as Arizona sees it, the only chance for an adequate supplementary supply of waters to lands now or heretofore irrigated along the Gila River, in either New Mexico or Arizona, is by the authorization of the Central Arizona project: the bringing in of waters from the main stream of the Colorado River to supply lower lands, mainly in Pinal County, Ariz.; and by an exchange, to release waters of the Gila River to which those lands have decreed rights to lands upstream in New Mexico and the upper valleys of Arizona, and then to provide for storage in the upper Gila River in New Mexico to store a sufficient quantity of the waters of the Gila River to provide the adequate supplementary supply for lands now or heretofore irrigated in the upper valleys of Arizona and below the dam site in New Mexico.

The best interests of New Mexico in the lower basin coincide with the interests of Arizona, because all the tributaries in the lower basin are wasting streams. If beneficial consumptive use is measured by the resulting depletion at the mouths of those tributaries, larger quantities of water could be used in New Mexico than if beneficial consumptive use of the waters were attempted to be measured at points of use, as contended by California.

REBUTTAL

I would like very briefly to rebut some arguments here made by spokesmen for California interests, very much as I did in the hearings on S. 1175, beginning at page 481.

1. It is argued that the 1,000,000 acre-feet of water mentioned in article III (b) of the Colorado compact is not apportioned to the lower basin.

I submit that the compact itself shows it is apportioned water; that the evidence in this record, including the testimony of Mr. Meeker, the statements of Mr. Carpenter, Mr. Hoover, Mr. Norviel, Mr. Lewis, and Governor Campbell, clearly disclose that the negotiators of the compact so regarded it and that the Members of Congress so regarded it when they approved the compact; and that the Supreme Court of the United States has held it to be apportioned water (*Arizona* v. *California*, 292 U. S. 341).

The particular ground of the decision to which I desire to call attention is the sixth ground of the decision reported on page 358.

2. It is argued that beneficial consumptive use is not measured by depletion of the Colorado River.

I submit that the negotiators of the compact were dealing solely with water flowing in a surface stream and that there is no way to measure beneficial consumptive use of water flowing in a surface stream except by the resulting depletion.

I further submit that article III (d) of the compact shows that the negotiators of the compact used depletion as the measure of consumptive use.

I further submit that the Boulder Canyon Project Act, the California Limitation Act, and the Arizona contract measure consumptive uses by the resulting depletion of the Colorado River.

The Arizona contract is in this record.

3. It is argued that reservoir evaporation losses are chargeable solely to Arizona; that California bears no part of them.

I submit that when water is stored in on-stream reservoirs or off-stream reservoirs, it is in equity diverted from the stream, and I further submit that equity requires that all parties benefiting from storage of water should bear ratably evaporation losses caused by such storage.

I further submit that section 8 of the contract between the United States and the Metropolitan Water District of Southern California is as follows:

"SEC. 8. So far as the rights of the allottees named above are concerned, the metropolitan water district of Southern California and/or the city of Los Angeles shall have the exclusive right to withdraw and divert into its aqueduct any water in Boulder Canyon Reservoir accumulated to the individual credit of said district and/or said city (not exceeding at any time 4,750,000 acre-feet in the aggregate) by reason of reduced diversions by said district and/or said city: *Provided*, That accumulations shall be subject to such conditions as to accumulation, retention, release, and withdrawal as the Secretary of the Interior may from time to time prescribe in his discretion, and his determination thereof shall be final: *Provided further*, That the United States of America reserves the right to make similar arrangements with users in other States without distinction in priority, and to determine the correlative relations between said district and/or said city and such users resulting therefrom."

There is incorporated in the appendix of the hearings on S. 1175 the contract between the United States and the Metropolitan Water District of Southern California, pages 209 to 306, inclusive, of the Hoover Dam contracts by Wilbur & Ely of 1933.

It is, therefore, clear that both the metropolitan water district and the Secretary of the Interior anticipated ratable sharing of such evaporation losses.

Mr. CARSON. Next, Mr. Chairman, I would also like to furnish each member of the committee and have printed in the record in one place the Colorado River Basin States Committee summary of portions of hearings before Subcommittee No. 4 of the Judiciary Committee in the Eightieth Congress on House Joint Resolution 225 and similar resolutions.

Mr. MURDOCK. Without objection, those may also be admitted following the prepared statement of Mr. Carson.

(The matter above referred to is as follows:)

STATEMENTS SUBMITTED BY THE COLORADO RIVER BASIN STATES COMMITTEE, REPRESENTING THE STATES OF COLORADO, WYOMING, UTAH, NEW MEXICO, AND ARIZONA, BEFORE SUBCOMMITTEE NO. 3 OF THE JUDICIARY COMMITTEE, THE HOUSE OF REPRESENTATIVES, EIGHTY-FIRST CONGRESS

HON. WILLIAM T. BYRNE, CHAIRMAN, AND SUMMARY OF PORTIONS OF THE HEARINGS BEFORE SUBCOMMITTEE NO. 4 ON JUDICIARY, HOUSE OF REPRESENTATIVES, EIGHTIETH CONGRESS

HON. CLIFFORD P. CASE, CHAIRMAN, PRESIDING

ON HOUSE JOINT RESOLUTION 225 AND SIMILAR RESOLUTIONS (MAY 17, 20, 26, AND 27, 1948)

On May 17, 20, 26, and 27, 1948, Subcommittee No. 4 of the Committee on the Judiciary of the House of Representatives, Eightieth Congress, held hearings on House Joint Resolution 225 and other identical or similar resolutions. These hearings having been reported, the page references in this summary are made to that printed report.

This summary deals only with the statements of those appearing in opposition to the proposed legislation. The full text of House Joint Resolution 225 appears on page 1 of the report.

There are now before Subcommittee No. 3 of the House Judiciary Committee similar resolutions, to wit, House Joint Resolution 3, and others which are identical or similar.

House Joint Resolution 3 differs somewhat in text from House Joint Resolution 225, but it is obviously intended to accomplish the same purpose. House Joint Resolution 3 reads as follows:

"Granting the consent of Congress to joinder of the United States in suit in the United States Supreme Court for adjudication of claims to waters of the Colorado River system.

"Whereas there are controversies of long standing, among the States of the lower Colorado River Basin, over the rights of those States to the use of water under certain provisions of the Colorado River compact, the Boulder Canyon Project Act, the Boulder Canyon Project Adjustment Act, and the California Limitation Act (Stats. Cal. 1929, ch. 16); and

"Whereas those controversies now adversely affect and limit the development of various projects in that basin for impounding, regulating, and using the waters of the Colorado River and its tributaries, the construction of which the Congress has heretofore authorized or may hereafter authorize, in the exercise of its constitutional powers; and

"Whereas the Secretary of the Interior, on behalf of the United States, has entered into various agreements with States, public agencies, and other parties of the lower Colorado River Basin relating to the storage and delivery of Colorado River water, and the rights of said parties to the delivery and use of water under those agreements are involved in the controversies hereinbefore referred to; and

"Whereas said States, after many years of negotiations, have been unable to settle such controversies by compact; and

"Whereas the Supreme Court of the United States in *Arizona* v. *California* (298 U. S. 558) held in effect that there can be no final adjudication of rights to the use of the waters of the Colorado River system without the presence, as a party, of the United States: Now, therefore, be it

"*Resolved by the Senate and House of Representatives of the United States of America in Congress assembled*, That consent is hereby given to the joinder of the United States of America as a party in any suit or suits, commenced within 2 years from the effective date of this joint resolution in the Supreme Court of the United States by any State of the lower basin of the Colorado River, as that basin is defined in the Colorado River compact, for the adjudication of claims of right asserted by such State, by any other State, or by the United States, with respect to the waters of the Colorado River system as defined in said compact available for use in that basin. Process in any such suit may be served upon the Attorney General."

The principal difference between the two resolutions is that under the provisions of House Joint Resolution 225 Congress would have directed the Attorney General of the United States to institute and maintain an action in the Supreme Court of the United States against certain States of the Colorado River Basin and require them to assert and have determined their claims and rights to the use of the waters of the Colorado River system. By the provisions of House Joint Resolution 3 Congress would grant consent to the joinder of the United States in suit in the Supreme Court for adjudication of claims to the waters of the Colorado River. Both resolutions seek the same objective.

Statements of those appearing in opposition to House Joint Resolution 225, in the order of their appearance, were as follows:

1. Hon. Carl Hayden, Senator from the State of Arizona (pp. 238–236).
2. Hon. Robert F. Rockwell, Representative in Congress from the State of Colorado (p. 237).
3. Hon. Frank A. Barrett, Representative in Congress from the State of Wyoming (pp. 237–239).
4. Hon. Walter K. Granger, Representative in Congress from the State of Utah (p. 240).
5. Hon. John R. Murdock, Representative in Congress from the State of Arizona (pp. 240–244).
6. Hon. Richard F. Harless, Representative in Congress from the State of Arizona (pp. 244–248).
7. Hon. Ernest W. McFarland, Senator from the State of Arizona (pp. 248–265).
8. Mr. Jean Breitenstein, attorney, Colorado Water Conservation Board (pp. 296–318, 517).
9. Mr. J. A. Howell, legal adviser to the State engineer of the State of Utah (pp. 318–329).
10. Further statement of the Hon. John R. Murdock, Representative in Congress from the State of Arizona (pp. 331–333).
11. Hon. William A. Dawson, Representative in Congress from the State of Utah (pp. 333–334).
12. Mr. Charles A. Carson, chief counsel, Interstate Streams Commission of Arizona (pp. 340–484, 487–488, 520).
13. Mr. Fred E. Wilson, attorney at law, member of the Colorado Basin States Committee, representing New Mexico (pp. 484–487).

Judge J. A. Howell made the principal statement in opposition to the resolution, first presenting the resolution of the Colorado River Basin States Committee opposing the resolution. The full text of that committee's resolution appears

on page 268. Judge Howell presented and discussed a brief which he submitted on behalf of the Colorado River Basin States Committee. This brief was signed by representatives of the States of Colorado, Wyoming, Utah, New Mexico, and Arizona.

THE COLORADO RIVER BASIN STATES BRIEF

This brief contains first an introductory statement of facts pointing out the provisions of the resolution, emphasizing that those responsible for the resolution were well aware of the fact that the Supreme Court of the United States in the exercise of its original jurisdiction will not render declaratory judgments. In order to make a determination of the rights to the use of the water of the Colorado River available for the lower basin, it will be necessary to determine the rights of all the basin States to the use of the water of the Colorado River. The brief further points out that the avowed purpose of the resolution is "for the purpose of avoiding a multiplicity of suits and expediting the development of the Colorado River Basin." It presents the question whether or not the acts proposed will accomplish the purpose. It is pointed out in this brief and by other testimony that there can be no question of a multiplicity of suits; and if one State of the Colorado River Basin brings a suit against any other State of that basin by which the rights of other States are affected, the States so affected can and would of course intervene, so that their rights might be fully protected. So far as expediting the development of the basin is concerned, the resolution, if adopted, would probably have the opposite effect and would delay the development.

After a recitation of these introductory facts, the brief presents the Colorado Basin States Committee resolution opposing the legislation.

The brief proceeds in part II with the argument. Under the argument the first proposition discussed is as follows:

"1. The jurisdiction of the Supreme Court, in the exercise of its original jurisdiction, so far as material for our consideration, extends only to justiciable controversies between the United States and one or more States, and to controversies between two or more States" (p. 272).

In support of this proposition the brief states:

"Article III section 2 of the Constitution of the United States provides, so far as material here, 'The judicial power shall extend to * * * controversies to which the United States shall be a Party;—to controversies between two or more States.' That section further provides 'In all cases * * * in which a State shall be a party, the Supreme Court shall have original jurisdiction.'

"The Supreme Court of the United States has had occasion frequently to pass upon the meaning of the foregoing constitutional provisions in suits or actions between States, and to fix the limits of its jurisdiction thereunder. It has held that it will not grant relief against a State unless the complaining State shows an existing or presently threatened injury of serious magnitude" (p. 272).

A number of cases are cited in support of this contention. Some of the most significant quotations in the cited cases are as follows:

"A potential threat of injury is insufficient to justify an affirmative decree against a State. The Court will not grant relief against something feared as liable to occur at some future time (*Alabama* v. *Arizona* (291 U. S. 286, 291))" (p. 272).

The brief goes on to state:

"The Court will not grant relief against something feared as liable to occur at some future time" (p. 272).

In *Alabama* v. *Arizona* the Court further said:

"This Court may not be called upon to give advisory opinions or to pronounce declaratory judgment * * *. In its jurisdiction in respect of controversies between States will not be exerted in the absence of absolute necessity" (p. 273).

The brief then proceeds with a discussion of the New River case (*U. S.* v. *Appalachian Electric Power Co.* (311 U. S. 377, 432), in which the Court said:

"To predetermine, even in the limited field of water power, the rights of different sovereignties, pregnant with future controversies, is beyond the judicial function" (p. 273).

The brief then proceeds with a discussion of the case of *Kansas* v. *Colorado* (206 U. S. 46), and quotes from that decision as follows:

"In such disputes as this, the court is conscious of the great and serious caution with which it is necessary to approach the inquiry whether a case is proved. Not every matter which would warrant resort to equity by one citizen

against another would justify our interference with the action of a State, for the burden on the complaining State is much greater than that generally required to be borne by private parties. Before the court will intervene the case must be of serious magnitude and fully and clearly proved. And in determining whether one State is using, or threatening to use, more than its equitable share of the benefits of a stream, all the factors which create equities in favor of one State or the other must be weighed *as of the date when the controversy is mooted*" (p. 273). [Italics supplied.]

The brief continues with the discussion of the case of *Nebraska* v. *Wyoming* (325 U. S. 558), involving the North Platte River, pointing out in particular that when this case was considered the construction of the Kendrick Dam in Wyoming had been authorized by Congress, and that this authorization was the basis of the Court's decision. This same case later was discussed by Mr. Jean S. Breitenstein.

The brief then succeeds with an additional thorough discussion of the proposition in question, citing numerous authorities in support thereof, and concluding the argument on this particular proposition with the following pertinent statement:

"It is impossible to conceive how there could from any point of view under the situation presented as to the Colorado River be a multiplicity of suits which is the only ground upon which the jurisdiction of the Court was predicated in the case of *Texas* v. *Florida*. Whatever suit be brought, and by either the United States or a State, any State whose rights are affected would either be parties or would have to voluntarily appear to protect their interests therein, and so there would only be the one suit * * *" (p. 276).

Proposition No. 2 in the brief reads as follows:

"2. There is no present justiciable controversy between the United States and the Colorado River Basin States, or any of them, or between any of said States" (p. 276).

It was pointed out that the only threat of injury advanced by the proponents of the bill was that "Arizona is asking the Secretary of the Interior to approve S. 1175 (the central Arizona project * * *." Commenting on that, the brief says:

"Well, what of it? Suppose the Secretary of the Interior is of opinion S. 1175 should be enacted, or that it should not be, or is doubtful about the matter, or has no opinion at all. Does that opinion rise to the dignity of an existing justiciable controversy? Obviously not, and his opinion is precisely in the same category as the opinions in the case of *United States* v. *West Virginia*, which the Court held did not rise to the dignity of a controversy, because whatever be his opinion, he can take no action until the Congress acts. It may act unfavorably on the bill, then there could be no controversy even at that time, much less now. Suppose it should act favorably, and the bill should become law, would the United States then want to become the moving instrumentality by which California might assert that Congress should not have passed the law? We submit not. It should require California to move to assert its right by bringing an action against Arizona, and assert that it was being injured in its rights by virtue of the authorized project" (p. 276).

The position of the committee on this particular point is clearly set forth in the following pertinent language:

"As we have shown, there is not only now no controversy between the United States and all or any of the Colorado River Basin States suggested by the California-Nevada brief, but there are in fact none, nor could there be, because those rights were protected in the Colorado River compact, as herein heretofore in our preliminary statement of facts pointed out that they are not and could not be now questioned by any of the basin States" (p. 278).

Nevada's position is discussed under this head, and it is pointed out that Nevada is concerned only because the central Arizona project bill contemplates the operation of a power plant at Bridge Canyon, above Lake Mead; and the operation of that plant will have the effect of reducing the power available to Nevada at Hoover Dam. Attention is directed to the fact that under the Colorado River compact power is subservient to the right to use the waters of the river for irrigation and domestic purposes. Therefore, the brief concludes that the real dispute is between California and Arizona, and that the points in dispute numbered three, to wit:

1. What is meant by what is called in the Colorado River compact "III (b) water"?

2. Concerns the question of uses of waters of the Gila River.

3. The issue of reservoir losses.

The meaning of "III (b) water" is discussed somewhat in detail. The pertinent provisions of the Boulder Canyon Project Act are discussed. The famous letter from Herbert Hoover to W. S. Norviel, dated November 26, 1922, was introduced in the record. That letter is reproduced on pages 279–280 of the hearings.

The brief goes on to state:

"In the light of what we have said at least from the point of view of the United States, this disposes of the contention of Nevada and California as to III (b) water, for (3) of the paragraph says that the 'State of Arizona shall have the exclusive beneficial consumptive use of the Gila River within the boundaries of said State' and it explains why III (b) water was separated from III (a) water, a separation which disturbs the writers of the Nevada-California brief if it is apportioned water. It was because it had nothing to do with the division of water between the upper and lower basin. It was Arizona's because the Gila River was Arizona's. But apart from all this argument as to III (b) water, it presents no present justiciable controversy between Arizona and California, because it does not jeopardize any of California's present use of the river's water" (p. 280).

With reference to the uses of Gila water, the matter is briefly discussed, pointing out the nature of the Gila River and what uses are made of the waters of that stream and its tributaries, that this use includes reuse and salvage waters, and that no State under the compact should be charged with waters so salvaged or reused. The conclusion on this particular point is well stated as follows:

"The short answer to this contention is, as we have already pointed out, this water in question is not III (a) water, but III (b) water, and that Arizona is entitled to all the water of the Gila River, and that therefore what is meant by 'consumptive beneficial use' in the compact becomes immaterial" (p. 281).

As to the issue of reservoir losses, it is California's contention that Arizona should stand all those losses. It is pointed out that this question may be important in the future, but it cannot be now because even if all reservoir losses were charged to California that State's present use of allotted water is not in jeopardy.

After again reviewing the three issues, the conclusion is arrived at as follows:

"Finally, what sort of disputes are these three claimed disputes? They are as to the meaning of certain provisions of the documents constituting the law of the river, which may or may not become important in the future but are not now, because they do not jeopardize any present use by California of the water of the river. They are, first: What is meant by 'III (b)' water as used in the compact? As to that, it is claimed Arizona has one opinion and California another. Second, what is the meaning of the term 'beneficial consumptive use of water' as used in the compact? As to that it is claimed the opinions of California differ from those of Arizona. Third, what is the interpretation to be given to the limit on California's use of the river, the 4,400,000 acre-feet per annum? California says that means without losses. Arizona says, so that brief claims, it means subject to losses. This demonstrates that what California really wants is a definition of these words and terms for future guidance. That can only be done by agreement or by a declaratory judgment of a court. She knows that the Supreme Court has decided it will not render declaratory judgments in the exercise of its original jurisdiction because of the constitutional limitation upon it. She cannot bring an action or suit to have their meaning fixed. So, what she proposes is that the United States shall bring the suit or action and thus indirectly give color of jurisdiction which would otherwise not exist. We say that the attempt would eventually be futile, because color of jurisdiction does not suffice. It must be existent. We say that if the bill of complaint which was filed would state all the three claimed disputes of California against Arizona as stated in the brief, and as we have shown that is all there is on the river, and then state the facts as to present use of the water of the river, and what is going to waste, it would not state a justiciable cause of action. If it went further, then it would state more than California has asked or has a right to ask" (p. 282).

The first two propositions involve legal matters. The remaining propositions are largely matters of policy.

Proposition No. 3 is not pertinent in the consideration of the present legislation.

Proposition No. 4 is stated as follows:

"4. The adoption of the proposed resolution will delay the development of the river" (p. 283).

The argument advanced in support of this point is pertinent when considering the present proposed legislation. Under this proposition, the practice of appoint-

ing a master or commissioner to take testimony is discussed. It is further pointed out that this kind of litigation almost without exception involves a great deal of time; and a determination can be made, if at all, only after long years of court procedure. Quoting from the brief on this point:

"The result of the adoption of the resolution, and the commencement of the action, pursuant thereto, instead of expediting the development of the Colorado River Basin as claimed in the resolution, will greatly delay it. The writer or writers of the California-Nevada brief are cognizant of the long delays in water litigation between States in the Supreme Court of the United States, but they claim that the issues in this case will be merely 'interpretations of statutes and other documents,' and therefore this case will differ from all previous water litigations. That statement but reinforces our claim that that is the extent of their claims, that they want these statutes and documents now construed solely for future guidance. That they cannot do as the decisions of the Supreme Court stand now, because uniformly that Court has refused to render declaratory judgments. Apparently they have not the courage to ask the Supreme Court to reverse those decisions, and parenthetically we may say they have been criticized, and so they ask the United States to pull their chestnuts, which may exist sometime, although they do not now exist, out of the fire which is not yet burning. They hope that the Attorney General, if the resolution passes, can camouflage an action to declare the meaning of certain 'statutes and documents' into a justiciable controversy, or at least be the intermediary by which they will be able to do it. We submit it would be a breach of faith to all the other basin States for the United States to lend California any aid or comfort in such an undertaking and to bring an action which would throw the rights of all the basin States and of the United States in the river in litigation which it will take many years to conclude. In other words, the inconsistency of the brief and the resolution is this: The brief claims that the disputes are confined to interpretations of instruments affecting only the rights in the river between Arizona and California. The resolution attempts to put in issue all the claims of all the States. Meantime California will endeavor to use the water to which the other States are entitled and will oppose any projects of the upper river, as she is opposing the central Arizona project, including the central Utah project now pending in Congress (S. 2095, H. R. 5233), and we can now hear her representatives shout, 'Why appropriate any of the money of the United States so needed for other projects to construct this project on the Colorado River when that river is in litigation before the Supreme Court of the United States, and it will be years and years before it will be determined whether there will be any water available for the project?' When reduced to the ultimate, this resolution is nothing but a flank attack upon the central Arizona project. But it will undoubtedly be followed, if it is adopted and the contemplated suit is brought, by frontal attacks upon every project for the development of the river. Putting it bluntly, California, having already received all the major projects needed by her to enable her to use not only the water to which she is entitled, but an amount greatly in excess thereof, wants to be in a position to use those excess waters which the other basin States are entitled to use but have not the facilities to enable them to so use.

"Then, after she has used them, she will raise the cry that she must not be deprived of them because it will ruin the wondrous civilization which has been builded upon their use. Indeed, this cry, while somewhat vague and feeble, is nevertheless audible in the resolution and in the brief. In the resolution it is intimated 'engineering, economic, and other facts' are factors to be considered in determining the rights of the basin States in the river. In the brief the immense amount of water involved is stressed. The number of people it will serve with domestic water is heralded—5,000,000 people. But vague and feeble though it now be, it will become a lusty yell once California is using water which really belongs to the other States for 5,000,000 people, or some such number. Thus, are the rights of the other States in the river to be sacrificed upon the altar of California's alleged economic needs? We submit the United States ought not to kindle the fire that will enable California to make that sacrifice and that is the purpose of the resolution and will be its effect if it is adopted and pursuant to it, the suit is brought" (p. 284).

The summary contained in the brief pertinent to the legislation now before Congress is as follows:

"1. Jurisdiction of the United States Supreme Court in controversies between States is determined by the Constitution of the United States and may not be enlarged or diminished by act of Congress.

"2. The Supreme Court has, by a long and consistent line of decisions, established the rule that a suit may not be maintained against a State by another State or by the United States unless the complainant has suffered or is immediately threatened with an injury of serious magnitude.

"3. The proposed suit by the United States against certain Colorado River Basin States does not come within the stated rule because there is no injury or threat of injury. This conclusively appears from the following irrefutable facts:

"(*a*) Every Colorado River Basin State is now using water in an amount substantially less than that to which it is fairly and equitably entitled under the documents which constitute the law of the river.

"(*b*) No project has been constructed, is under construction, or has been authorized for construction in any State which threatens to diminish the supply of water which admittedly is available to each other State under the documents constituting the law of the river.

"(*c*) Very large amounts of Colorado River water are flowing unused across the international boundary into Mexico and there is no claim that within the immediate future those amounts will be so substantially reduced as to interfere with the availability of water necessary to supply the admitted share of the proponents of the resolution.

"(*d*) There is no suggestion of any projects for development of Colorado River water which might interfere with the claimed rights of any State except projects which are of such magnitude that Federal financial is essential. Projects of that character must be authorized by Congress and financed by congressional appropriations. The availability of water for those projects is a proper concern for Congress when considering the necessary legislation. Under our Constitution and applicable decisions of the Supreme Court, Congress cannot avoid that responsibility or obtain assistance by requesting declaratory or advisory opinions of the Supreme Court.

"4. The Colorado River Basin States Committee, and the States composing that committee, affirm that they recognize as valid and binding instruments and legislation and as the law of the river the Colorado River compact; the Boulder Canyon Project Act, the California Self-limitation Act, the Boulder Canyon Project Adjustment Act, the Mexican Water Treaty of 1944 * * *.

"5. It is reasonable to assume that any Supreme Court litigation, such as that proposed, will require a period of years before ultimate determination by the Court. The practice of the Court in interstate cases involving disputes as to facts is to appoint a master or commissioner for the taking of testimony. Experience has shown that this process is long drawn out and costly. * * *

"6. The effect of the proposed litigation can only result in delay in the development of the river. Congressional authorization of projects or appropriations for construction of projects will be contested upon the ground that until the decision of the Court the availability of a water supply is uncertain.

"7. * * *

"8. The proposed legislation is unnecessary as it must be assumed that the Attorney General of the United States and the responsible officials of each State will do their duty and institute whatever litigation is necessary to protect the rights of their respective governments.

"9. The assertion that the legislation is necessary because the United States is an indispensable party to litigation involving the issues presented is without merit because (*a*) the mere presence of the United States in the suit does not create a justiciable controversy, (*b*) there is no justicable controversy and hence legislation giving the consent of the United States to suit is unnecessary, (*c*) if any State believes and can establish that it is being injured or threatened with injury by another State, a suit by such injured State may not be defeated by the assertion that the United States is an indispensable party, and (d) whenever in the future some controversy, as yet undefined either as to issues or parties, arises and in connection with such litigation it is proper for the United States to be a defendant, then will be the time for Congress to give consideration to legislation involving consent to be sued therein" (pp. 285–287).

ADDITIONAL ARGUMENT ON LEGAL QUESTIONS

A very thorough and exhaustive statement of the legal questions involved was made by Mr. Jean S. Breitenstein, attorney, Colorado Water Conservation Board, and a recognized authority on the subject of water rights. Mr. Breitenstein's statement appears beginning on page 296.

91190—49—ser. 11, pt. 1——35

He first discusses the map in evidence, showing the geographical location of the Colorado River and of the principal tributaries thereto. Commenting on the lower-basin, he said:

"In the lower basin, the principal tributaries are the Little Colorado River, which rises in Arizona and enters the main stream a short distance below Lee Ferry.

"The Virgin River, which drains part of Utah, Nevada, and Arizona; the Bill Williams River, which rises in Arizona and enters the Colorado in that State; and the Gila River.

"The Gila River rises in New Mexico, flows across Arizona to enter the main stream near Yuma, Arizona. The Gila River and its tributaries, because of their geographic location, produce water which is available for use only in the States of New Mexico and Arizona. The greater portion of the water supply of the Colorado River comes from the State of Colorado. Using approximate figures, of the virgin flow of the river at Lee Ferry, Ariz., the division point between the upper and lower basin, approximately 74 percent of that water comes from the State of Colorado. At the international boundary, approximately 64 percent of the virgin flow of the river comes from the State of Colorado.

"The State of California, which is strongly supporting the resolution before the committee, contributes no water whatsoever to the Colorado River system. The area of California within the natural basin of the Colorado River is approximately 3,500 square miles, or a smaller area than the portion of the State of Arizona which is in the upper basin of the river" (p. 297).

Having concluded his geographical comments, Mr. Breitenstein proceeded with the legal questions involved. He emphasized that the Department of the Interior and the Bureau of the Budget have indicated that approval will not be given to any new projects until there is an allocation, between the States, of the water supply available for use in each of the States. He explained that the matter of the dispute between Arizona and California was involved in the question. He further stated:

"The State of Colorado is opposed to any congressional legislation of the type being considered by the committee. We feel that any such legislation directly affects the upper basin States. It is true that the States of Colorado and Wyoming are not named as prospective parties defendant in the resolution which is presented, but each of those States is a signatory to the Colorado River compact.

"Certainly any lawsuit which would involve the interpretation and application of the compact would be a matter of vital interest to all of the States who are signatory to that compact" (pp. 298–299).

Mr. Breitenstein also contends that the proposed legislation probably would require a long period of time before a final decision could be reached; but during that time development of the river would be stymied. He said:

"We note that the resolution says that the purpose of it is to aid in the development of the Colorado River Basin. We question that statement and the sincerity of that statement. The State of California has its development now. It has the Boulder Canyon project, the dam at Boulder, now known as the Hoover Dam; also the All-American Canal, Parker Dam, the aqueduct to southern California area; Davis Dam is now under construction.

"The facilities which are now constructed in California for the use of Colorado River water have a capacity to divert from the stream more than 8,000,000 acre-feet of water annually. We believe that California is limited in her use of III (a) water to 4,400,000 acre-feet. Yet these facilities, which that State has already constructed, could use 3,600,000 acre-feet of water more than we feel is her share, her determined share of III (a) water" (p. 299).

Enlarging on the legal questions, he contends that the legislation is unwise, inasmuch as the committee knows that Congress may not enlarge or diminish the jurisdiction of the United States Supreme Court, citing authorities in support of this argument, and commenting on those authorities. He then discusses the question, "Now what is a justiciable controversy?" His conclusions on this point are as follows:

"The Supreme Court of the United States has held that it will not grant relief against a State unless the complaining State shows an existing or presently threatened injury of serious magnitude. The Court will not grant relief against something feared, as liable to occur at some future time. The rule that judicial power does not extend to the determination of an abstract question has been announced in numerous cases. For there to be a justiciable controversy it must appear that the complaining State has suffered a loss through the action of the

other State, furnishing a claim for judicial redress or asserts a right which is susceptible of judicial enforcement according to the accepted principles of jurisprudence. The mere fact that a State is plaintiff is not enough. An injunction will issue to prevent existing or presently threatened injuries, but will not be granted against something merely feared as liable to occur at some indefinite time in the future" (p. 300).

In support of this contention, he cites a number of authorities, and, commenting on these authorities, he makes the following pertinent statement:

"Now, those are the rules, and we say when you boil those down they mean that you have got to have an existing injury of serious magnitude, or an immediately threatened injury of the same type. We have neither in this instance. California is not using the amount of water to which she is admittedly entitled" (p. 300).

He proceeds with a discussion of the waters available for use in Arizona as shown by Mr. Royce J. Tipton, consulting engineer for the Colorado River Water Conservation Board, in hearings on S. 1175.

Then he makes the following statement:

"Well, now, what is the threatened injury? So far as I know, there is no project under construction or authorized in any part of the Colorado River Basin which in any way would threaten to reduce or diminish the flow of the river so as to make available to California less than 4,400,000 acre-feet of water. The only project which has been talked about at all as constituting a threat is the central Arizona project of Arizona. That project has not been authorized by Congress; but unless and until it is authorized it cannot be said that that project constitutes a threat to the State of California. So here you do not have an injury and you do not have a threat. Hence, there is not a justiciable controversy" (p. 301).

He then discusses the North Platte case, *Nebraska* v. *Wyoming and Colorado*, explaining that the reason the Supreme Court took jurisdiction over that controversy was that the Kendrick project had been authorized for construction in Wyoming, that appropriations had been made for that project, and that that constituted a threat to Nebraksa in that that project proposed to use water which properly was within Nebraska's share of the flow of the stream.

He calls attention to the decision in that case, a 5 to 3 decision, with only eight judges participating. He quotes from the two dissenting opinions, one from Justice Roberts and the other from Justice Frankfurter, the latter being joined in by Justices Rutledge and Roberts. He quotes from the last mentioned opinion as follows:

"Such controversies between States are not easily put to repose. Even when judicial enforcement of rights is required, the attempt finally to adjudicate often proves abortive. Our reports afford evidence of this fact. Kansas and Colorado came here twice at the instance of Kansas in a dispute over the flow of the Arkansas River. In a case presenting, on the whole, less difficulty than the present one, this Court entered a decree June 5, 1922, only to find it necessary to revise it on October 9, 1922. But the controversy would not down; the parties came back here on three occasions because of misunderstandings and disagreements with respect to the effect of our decree" (pp. 303–304).

In his presentation he then proceeds to point out that litigation of this kind is generally long drawn out. Factual issues are involved; and this probably means the appointment of a master or commissioner to take testimony. Such litigation not only requires a great length of time, but is also very expensive.

When questioned concerning the effect of the passage of a resolution of this character, he states, in answer to a question by Mr. Case:

"If Congress should direct this legislation, it seems to me it would constitute a legislative finding that there is such a justiciable controversy" (p. 307).

His conclusions on this matter may be summarized in an answer to a question by Mr. Case as follows:

"Mr. CASE. How do you think this is going to be settled?

"Mr. BREITENSTEIN. It seems to me, Mr. Chairman, that the pattern for this sort of a situation is furnished by the North Platte case.

"If a project is authorized in any of the States other than California, which California considers a threat to her water supply, then you come within the pattern of the North Platte case: California can bring a suit" (p. 309).

He then discusses the question as to whether or not the United States is an indispensable party to this kind of litigation, pointing out the distinction beween his case and the Arizona case, directing attention to the fact that in the Arizona case that State had not signed the compact when the action was brought; and

since the only available water was from dams constructed by the United States, the United States was an indispensable party. His contention was that if California could state a cause of action, suit could be brought by that State against Arizona, and the Attorney General of the United States could intervene when he thought the United States had any interest in the litigation.

He then pointed out that the contemplated projects on the Colorado River would have to be financed by the Federal Government, and:

"I think everyone recognizes that. It seems to me that it is the duty, the responsibility, of Congress, to make its own determination as to whether or not there is a water supply available for those projects. The central Arizona project is one mentioned most at this time. It is one on which hearings have been held. The project is badly needed by the State of Arizona.

"The Congress of the United States, in the Boulder Canyon Project Act, authorized the making of a compact between the States of California, Nevada, and Arizona. I am sure that that has been called to your attention. If not, Judge Howell will do it in his statement. That authorization for a compact provided for 2,800,000 acre-feet for the State of Arizona and the State of Arizona shall have full use of the waters of the Gila River system.

"Now, that is the existing congressional attitude on that matter and if, as we in Colorado think, the central Arizona project will use water within that amount, the supply is available for the project and if California disagrees with that, when and if the project is authorized, California can bring a suit and obtain a judicial determination on those various matters which have been presented to the committee" (p. 311).

Discussing then the question of reservoir losses, he says:

"The California people have given you their ideas on that. Our ideas are to the contrary. Now, the mere fact that there are differences of opinion on those three matters does not mean that there is a justiciable controversy.

"A difference of opinion is far different from a justiciable controversy" (pp. 311-312).

He next quoted authorities in support of this position.

He then proceeded with a discussion of the use of the phrase "beneficial consumptive use" in the compact, and how a determination of that issue would affect the upper-basin States, particularly Colorado. In answer to a question by Mr. Case, he stated:

"The compact does not define 'beneficial consumptive use.' It does not say where it shall be measured. The two differences of opinion in that regard are these:

"California says that you measure the beneficial consumptive use at the place of use. The other States, except possibly Nevada, say that it is measured as stream depletion. Now, the difference is this: California would say that if you have a ditch taking out irrigation water to a 160-acre farm, the diversion into the ditch is so much; and the return to the stream is so much. The difference between those two is 'beneficial consumptive use." (p. 314).

On this subject he also read from the testimony of Mr. Tipton, given before the Senate committee on S. 1175 in 1947. He closes his statement with the following summary:

"In closing, I would just like to say one other thing. It is up to Congress, of course, in looking after the welfare of the whole country, to decide what projects shall be financed by the Federal Government for the use of these western waters. We appreciate the fact that in southern California they have had a great growth, that they anticipate the need of additional water to take care of even greater growth in that area.

"I called your attention this morning to the fact that California, under the testimony of its own witnesses before the Senate committee on S. 1175, was using only 3,200,000 acre-feet of water annually. California has more than a million acre-feet to go before it is using up its entire share. While I am no engineer, it is simple mathematics to figure up that if you assume that an adequate supply of water for municipal uses is 150 gallons per person per day, a million acre-feet of water will sustain a population of about 6,000,000 people. That is conservative. We feel that, so far as national welfare is concerned, it is just as important to look after the hinterland and the provinces as it is to look after the big cities on the seacoast. We feel that from a national standpoint it is just as important that we in the mountains, the deserts, the valleys, have water to sustain a population, to sustain agriculture, and to sustain industry there, as it is to sustain a population in southern California, particularly when

they are seeking water which would furnish a municipal supply for more than 6,000,000 additional people.

"We are opposed to this legislation and we respectfully ask that the committee recommend against its passage" (pp. 317–318).

Judge J. A. Howell, who had presented the brief on behalf of the Colorado Basin States Committee, then proceeded with his statement, introducing a resolution of the Colorado Basin States Committee, opposing the proposed legislation and commenting on the bill before the committee. He emphasized that when a project under the Reclamation Act is brought before Congress, Congress must determine whether there is water available for the project. Judge Howell stated:

"Now, whether or not that determination is simple, as to which there is no question, or whether it is difficult, nevertheless it seems to me the onus of that determination is on Congress, and what I do not want to repeat is what Mr. Breitenstein has just said with reference to the necessity of a project being authorized, at least before there could be any justiciable controversy. It does seem to me that until some project is authorized which infringes upon the rights of some State, the question is moot and cannot give rise to a controversy cognizable before the Supreme Court in the exercise of its original jurisdiction" (p. 320).

He questions the sincerity of the resolution, pointing out that perhaps the States of California and Nevada feel that they cannot state a judiciable cause of action against any of the other States, and they hope by means of the resolution to give color of jurisdiction when otherwise there would be no jurisdiction in the Supreme Court of the United States.

He also questions the proposition that the United States is an indispensable party to any such litigation, commenting on testimony of Mr. Breitenstein. He further emphasized that if California thought it could state a cause of action against Arizona it could bring that suit without the passage of the proposed legislation.

He then analyzed the dispute between Arizona and California, discussing article III (a) of the compact and then article III (b) and surplus water, what are apportioned waters, provisions of the Boulder Canyon Project Act, and proceeds to say:

"Now, the only reason why I should like to emphasize that situation is that, as I conceive of it, there are three methods in which a compact may be made between States under the constitutional provisions:

(1) That the States go out and make a compact as settling their interests between them; and then it is ratified by the Congress, which constitutes, of course, an authorization and is equivalent to an authorization and makes a valid contract; or

(2) The Congress may prescribe the exact terms of the compact which is to be entered into by two or more States, and then, of course, I think there would be no necessity for any ratification; or

(3) The Congress may do as it did here; namely, prescribe that certain provisions should be made in this compact between Arizona, California, and Nevada, leaving it to those States to determine what other matters they might agree upon, and it would be only as to them that there would be any ratification.

"So, I submit to you that there is no necessity or reason for the passage of this resolution as it is proposed, and that, therefore, the report should be adverse upon the adoption of the resolution; and that, inasmuch as the United States, by virtue of this provision in the Boulder Canyon Project Act, has given a legislative determination as to at least two of the matters which are presented here by California as reason for the bringing of this action, so that the question as to what is meant by beneficial consumptive use, if I am correct in my interpretation of the provisions of the Boulder Canyon Project Act, is absolutely immaterial, because under that act Arizona is entitled to all of the Gila River, and whether you adopt the California method of measurement, or whether you do not, is immaterial.

"In other words, the Congress, having by legislative enactment in the Boulder Canyon Project Act determined that III (b) water is apportioned water and that Arizona is entitled to all the water of the Gila River, ought not by the adoption of this resolution reverse that determination" (pp. 327–328).

The next legal discussion is by Mr. Charles A. Carson, chief counsel, Interstate Streams Commission of Arizona, whose testimony appears on page 340 of the hearings.

He introduced for the record a portion of his testimony on the Gila bill (H. R. 5434, 79th Cong.). In that statement he discussed briefly first the Mexican Treaty, pointing out that in 1924 Mr. Harry Chandler, of the Los Angeles Times, had stated that at that time he and his associates owned 833,000 acres of land in Mexico immediately below the border, of which some 600,000 acres were irrigable from the waters of the Colorado River. At the time Arizona was admitted as a State, in 1912, these people owning this land in Mexico contended that Arizona could not divert from the main stream of the Colorado River without the consent of Congress.

Mr. Carson then proceeded to discuss the negotiations leading up to the signing of the Colorado River Compact, particularly that 1,000,000 acre-feet of III (b) water was included in the compact to compensate Arizona for uses then being made of Gila River waters. In support of this proposition, he had first introduced in evidence a letter from Herbert Hoover to W. S. Norviel, dated November 26, 1922, as follows (p. 343):

DEPARTMENT OF COMMERCE,
OFFICE OF THE SECRETARY,
Los Angeles, Calif., November 26, 1922.

Mr. W. S. NORVIEL,
State Engineer, Proenix, Ariz.

MY DEAR NORVIEL: This is just by way of registering again my feelings of admiration for the best fighter on the commission. Arizona should erect a monument to you and entitled it "1,000,000 acre-feet."

I am sending you herewith a photograph which does not purport to be a likeness, but it is a better-looking fellow than the one you have, and I send it as an excuse for writing this letter expressing my personal appreciation of this fine association which we have had.

Faithfully yours,

HERBERT HOOVER.

This statement shows that Mr. Carson next presented the testimony of Gov. Thomas E. Campbell given before the Arizona-Colorado River Commission. Mr. Campbell was Governor of Arizona in 1922 at the time the compact was signed and was present while it was being negotiated. In his testimony he recites that part of the negotiations concerning uses of the Gila River water, emphasizing the fact that there was an understanding between the compact makers to the effect that the 1,000,000 acre-feet of III (b) water was included in the compact to compensate Arizona for the then existing uses of Gila water.

Quoting from Governor Campbell's testimony:

"Q. Was anything said about designating this million acre-feet for Arizona?—A. Yes; that was discussed, and it was concluded that we could not tag that as belonging to Arizona because the plan on which we proceeded was that the waters be divided among the basins and no particular water would be allowed to any one State. If we attempted to tag it, then every other State would demand that it get a certain amount of water.

"Q. Was here any agreement between the Arizona representative and the representatives of the other lower basin States as to setting aside to Arizona the water described in paragraph 3B of the proposed compact?—A. Yes; there was a definite understanding that after the seven-State compact was ratified, so far as the three States in the lower basin were concerned, they would enter into a compact in which it would be agreed that all of the water of the Gila River would go to Arizona.

"Q. Who were present at the discussions which resulted in that understanding?—A. Mr. McClure, of California; Mr. Scrugham and Mr. Squires, of Nevada; and Mr. Norviel and myself, of Arizona" (p. 344).

In this statement Mr. Carson next included the statement of Mr. W. S. Norviel, of Phoenix, Ariz., who was the Arizona commissioner in negotiating the Colorado River Compact. This statement discloses that Mr. Norviel attended the negotiations in his official capacity, and that he objected to the compact until there was an understanding that 1,000,000 acre-feet of III (b) water would be included to compensate Arizona for Gila uses. A part of his testimony was given before the Arizona-Colorado River Commission, and was as follows:

"What discussion was had relating to the said paragraph (b) of article III and its meaning and purpose?—A. I had steadfastly refused to agree to the original draft that merely included the Gila River; and after several days of discussion and argument, during which the conference refused to exclude the Gila and I refused to accept the draft which included the Gila, a compromise was

reached in the form of article III (b), which provided the extra million acre-feet to compensate Arizona for the inclusion of the Gila River in the Colorado River System. It was fully understood by all that this million acre-feet was for the sole and exclusive use of Arizona, although the language used provided for its use by the lower basin. I have explained why such wording was used" (p. 347).

The statement of Mr. Carson's next included testimony of Mr. C. C. Lewis, also given before the Arizona-Colorado River Commission. Mr. Lewis was assistant State water commissioner for Arizona in 1927, and in his official capacity he attended the negotiations leading up to the compact. Concerning the question of III (b) water Mr. Lewis said:

"Q. What discussion was had relating to the said paragraph (b) of article III and its meaning and purpose?—A. Due to Mr. Norviel's firm refusal to sign the compact with the Gila River included, there were several days' delay and the final result was paragraph (b) of article III, with the definite understanding that this million acre-feet belonged to Arizona in compensation for inclusion of the Gila River in the Colorado River system.

"Q. Was the answer that you have given of the meaning and purpose discussed at the full meeting of all the delegates at this conference, including California and Nevada?—A. Yes" (p. 350).

The Carson statement then continues with a discussion of some of the efforts that had been made to arrive at a compact between the lower-basin States, and particularly an informal attempt that was made by the governors of the upper-basin States to arbitrate the matter. As a result of this attempt at arbitration the governors submitted a proposal at Denver on August 30, 1927, suggesting a division of the waters of the lower basin as follows:

"1. Of the average annual delivery of water to be provided by the States of the upper division at Lee Ferry, under the terms of the Colorado River Compact—

"(*a*) To the State of Nevada, 300,000 acre-feet.

"(*b*) To the State of Arizona, 3,000,000 acre-feet.

"(*c*) To the State of California, 4,200,000 acre-feet.

"2. To Arizona, in addition to water apportioned in subdivision (*b*), 1,000,000 acre-feet of water, to be supplied from the tributaries of the Colorado River flowing in said State and to be diverted from said tributaries before the same empty into the main stream. Said 1,000,000 acre-feet shall not be subject to dimunition by reason of any treaty with the United States of Mexico, except in such proportion as the said 1,000,000 acre-feet shall bear to the entire apportionment in 1 and 2 of 8,500,000 acre-feet" (p. 351).

The Arizona delegation was willing to accept the recommendations made, but California refused to accept them. Arbitration having failed, the next step in the development of the river was the passage of the Boulder Canyon Project Act in December 1928. Mr. Carson points out that Congress undertook to give effect to the recommendation of the four upper-basin States governors in several ways in that act. The statement then quotes as follows from the act:

"The States of Arizona, California, and Nevada are authorized to enter into an agreement which shall provide (1) that, of the 7,500,000 acre-feet annually apportioned to the lower basin by paragraph (a) of article III of the Colorado River compact, there shall be apportioned to the State of Nevada 300,000 acre-feet and to the State of Arizona 2,800,000 acre-feet for exclusive beneficial consumptive use in perpetuity" (p. 351).

The statement here points out that Congress reduced Arizona's claim, as approved by the upper-basin governors, from 3,000,000 to 2,800,000 acre-feet, and then continues to quote from the act "and (2) that the State of Arizona may annually use one-half of the excess or surplus waters unapportioned by the Colorado River compact; and (3) that the State of Arizona shall have the exclusive beneficial consumptive use of the Gila River and its tributaries within the boundaries of said State" (p. 352).

Mr. Carson then introduced for the record his statement made before a subcommittee of the Senate Committee on Public Lands, United States Senate, Eightieth Congress, first session, on S. 1175. This statement contains some of the same data appearing in his former statement, but in addition thereto contains a statement made by Judge Clifford H. Stone, director, Colorado Water Conservation Board, and Commissioner for Colorado on the Upper Colorado River Basin Compact Commission, which statement appears on pages 422–428 of the hearings. Judge Stone's discussion was very comprehensive, dealing principally with two questions: (1) Is III (b) water apportioned water, and (2) what is beneficial consumptive use? His conclusions are that III (b) water is apportioned water, and that California, by passage of the Self-Limitation Act, has renounced any

claim to that water and, as to beneficial consumptive use, particularly that of the waters of the Gila River. He supports Arizona's theory that this use should be measured by net depletion, and disagrees with the California interpretation, concluding with this statement:

"On the contrary, we have here submitted from the minutes of the compact commissioners what they had in mind when they considered the use of the term, and the only measure evidenced by the compact itself of beneficial consumptive use is that of depletion.

"Then, in conclusion, the Congress, we believe, will not approve an unconscionable portion in interpreting the Colorado River compact for the purposes of proposed legislation. Nor would a court give approval to any interpretation of a solemn agreement among States which would be inequitable. It cannot be assumed that the compacting States intended to apportion water between the upper and lower basins of the Colorado River by terms and conditions, the interpretation of which would limit one of the States to its existing uses of water when the compact was made with a comparatively small opportunity for future development. We submit that the States did not do so.

"California, under the compact, has proceeded with extensive development. California, according to the statements made before this committee, now claims that there is no water for the proposed central Arizona project or any other water development—future development, I mean—in the State. The California spokesmen arrive at this conclusion through the interpretations of the Colorado River compact which they asked this committee to accept. May I submit that, if these interpretations are approved by this committee or should be approved in the future by a court, the terms of the Colorado River compact would be held to deny one of the signatory States an equitable share of Colorado River water" (p. 428).

The Carson statement in question then contains a statement by Mr. R. J. Tipton, consulting engineer for the State of Arizona and the Central Arizona Project Association; a statement by Mr. R. Gail Baker, State reclamation engineer for Arizona, and a statement by Mr. E. B. Debler, consulting engineer for the State of Arizona. While these statements are constructive, they do not appear pertinent to the particular issue now before this committee.

As a part of this statement of Carson's, there was included for the record a copy of a portion of the contract by the State of Arizona with the United States for water, which was made in 1944 (p. 457). Attention is directed to the fact that this contract recognizes the rights of New Mexico and Utah to share equitably in the waters apportioned to the lower basin.

This particular portion of Mr. Carson's statement continues to page 484 of the hearings.

Later in the hearings Mr. Carson pointed out that in 1939 the Arizona Legislature passed an act in which they offered a compact to California, in terms specified as Arizona construed section 4 (a) of the Boulder Canyon Project Act. He introduced in the record a copy of that compact (pp. 487–488). It will be noted that, under the terms of the proposed compact, Nevada would receive 300,000 acre-feet and Arizona 2,800,000 acre-feet annually of III (a) water; that, in addition thereto, Arizona would receive one-half of the surplus waters unapportioned by the Colorado River Compact and the exclusive beneficial consumptive use of the Gila River and its tributaries within the boundaries of the State.

Again during the hearings Mr. Carson directed attention to certain portions of the record that he had heretofore made, emphasizing the fact that the division of the waters of the lower basin was a matter of contract law; that the rights of the United States under the provisions of section 13 (b) of the Boulder Canyon Project Act were subject to and controlled by the Colorado River Compact. He concluded with this statement:

"So it is a matter of contract, but certainly by the act of Congress we have a right to expect that Congress knows what it intended and what it will do in the future as particular projects come up for authorization, and we know that we must be able to show that there is an available water supply for a particular project, and we believe that we can do that when this S. 1175 comes before the proper committees of Congress, and we accept that burden" (p. 520).

ADDITIONAL WITNESSES APPEARING IN OPPOSITION TO THE BILL

Senator Hayden

Of particular interest were the remarks of the Honorable Carl Hayden, Senator from Arizona. Senator Hayden pointed out that he came to the House of

Representatives in 1912 and served in the House for 15 years. During that time he was active on the Irrigation and Reclamation Committee, and helped to prepare legislation authorizing the appointment of the Federal representative to join with the seven States of the Colorado River Basin for the purpose of negotiating a compact. After that act was passed, Mr. Hayden went with a delegation of Congressmen to call upon the then Secretary of Commerce, Mr. Herbert Hoover, and urged him to accept the position of Federal representative. Senator Hayden further pointed out that during the compact negotiations it was concluded that there was not sufficient available information upon which an allocation of water to each of the States could be made. It was then decided to divide the waters of the Colorado River system between the upper and lower basins. He said that there was urgent need for the compact at that time due to the fact that the Colorado River was flooding the Imperial Valley.

After the compact was negotiated, a bill was introduced in Congress to authorize the construction of a dam at Boulder Canyon. Not only Arizona but also the upper basin States demanded that before that bill was passed some limitation should be placed upon the State of California as to the use of the waters of the river, that that limitation was required by the Boulder Canyon Project Act, and it was accepted by the State of California by legislative enactment. Senator Hayden had been elected to the Senate when the Boulder Canyon Project Act was before Congress in 1928. He gives a summary concerning the controversy over that act, remarking that the record is perfectly clear that the additional 1,000,000 acre-feet of III (b) water was intended to recognize Gila River uses. He pointed out that the final agreement, after conferences, was approved by all concerned. To quote Senator Hayden on this point:

"That proposition was brought to us by Senator Pittman, of Nevada, who said that it was a complete acknowledgment of all that the Senators from Arizona had claimed. It is an acknowledgment by the Congress of the United States in approving the Colorado River compact. The California Senators had no objection. Senator Shortridge and Senator Johnson said, 'Yes; our State has limited itself. We have no interest in the Gila River because it comes into the Colorado River below any California diversion.' Based on the action taken pursuant to that agreement, Senator Ashurst and I allowed the bill to pass and become law. We thought that everything was settled to the satisfaction of all concerned" (p. 235).

Senator McFarland

The Honorable Ernest W. McFarland, United States Senator from Arizona, gave a rather detailed statement, outlining the purpose of the bill and explaining that the companion resolution in the Senate had been introduced on the last day of the hearings on S. 1175, the central Arizona project bill, and that identical arguments in support of this bill had been offered in opposition to S. 1175. He pointed out that the passage of the resolution could be interpreted as a decision by Congress that there was a judiciable controversy, and that that action would be an invasion of the jurisdiction of the Supreme Court. He said that in the present case there was no injury or threat of injury upon which a cause of action could be stated, that there could not be one until the project was authorized. He cited authorities for these contentions, particularly the case of *New York* v. *Illinois and Sanitary District of Chicago* (274 U. S. 488) and the case of *Ashwander et al.* v. *Tennessee Valley Authority et al.* (297 U. S. 288). He then observed:

"I turn now, Mr. Chairman, to the self-evident proposition that Congress has already placed an unequivocal construction upon the Colorado River compact and by the promulgation of the Boulder Canyon Project Act it has clearly expressed its views and intentions as to the division of waters of the Colorado River as between the States of California, Nevada, and Arizona. Congress authorized the making of the Colorado River compact; in due course, it approved the same; it also construed the compact, and required California to agree to its rights and obligations thereunder" (p. 254).

Under this proposition he discussed the California Self-Limitation Act and the Boulder Canyon Project Act, pointing out the intention of Congress as expressed in the Boulder Canyon Project Act in dividing III (a) water: 300,000 acre-feet per year for Nevada, 2,800,000 acre-feet per year to Arizona, and 4,400,000 acre-feet per year to California; and it further provided, of course, that Arizona should receive in addition thereto the exclusive right to the use of the Gila River waters. He explained that article III (b) had been included in the compact expressly to compensate Arizona for the inclusion of the Gila

in the Colorado River system. He offered for the record certain remarks as shown by the Congressional Record of the Seventieth Congress, second session, supporting his contention on this proposition. These remarks appear on pages 251–259.

He summarized his position on this proposition by the following language: "Let me reemphasize this point: That the intention of Congress during the course of the debate and adoption of the Boulder Canyon Project Act is made abundantly clear when the record as a whole is considered. However, I should like to say that it is unnecessary to peruse any part, or all, of the Congressional Record in an effort to find the guiding intention of the Congress, because the Boulder Canyon Project Act itself is entirely plain and understandable and clearly shows what was the intention of Congress in the enactment thereof" (p. 260).

Senator McFarland then briefly touched upon the question of the need of the two States for water, stating that in his opinion this question did not have a proper place in this hearing. He pointed out, however, that California's asserted needs were for the future to permit her to grow, while Arizona's needs were present ones, not to grow but to maintain an existing economy.

His conclusions are as follows:

"Now, Mr. Chairman and members of the committee, in conclusion I merely want to say this: That the bill S. 1175 is pending before Congress, and I think that the evidence which has been presented here by other witnesses has clearly demonstrated that there is not a justiciable cause of action, or issue, which could be presented to the Supreme Court at this time.

"So what would be the effect of the passage of this resolution? The effect would be this: That we would be delayed in the consideration of S. 1175, and I submit, Mr. Chairman, that that was the purpose of introducing the resolution. Did you ever hear of California wanting a delaying resolution passed while she was coming before Congress, getting millions of dollars to develop her own State? We never heard of that. She did not want to litigate then—not as long as she was getting her own projects developed.

"What she would do now is tie up the consideration of this project for Arizona—and not only this project, but every other project in the Colorado River Basin.

"For what purpose? What would be gained? Well, she could delay 2 years, 3 years; maybe it would take 10 years if a master were appointed; and what would happen in the meantime? She stated that she already has the projects built to divert more water; she is now only diverting some 3,000,000 acre-feet—there could not be a justiciable issue now, she is within her 4,400,000 acre-feet. But if she could delay any consideration by Congress for the authorization of other projects, she could go ahead and put more water to beneficial use, and then she would come here and say to the Congress of the United States: 'Don't take away water that is needed for irrigation of the lands where people already live and where water is needed for drinking purposes'" (p. 264).

Other witnesses

Strong opposition to the bill, and particularly to the principles involved in the bill, was expressed by the following witnesses on behalf of their respective States:

1. Hon. Robert F. Rockwell, Representative in Congress from the State of Colorado (p. 237).
2. Hon. Frank A. Barrett, Representative in Congress from the State of Wyoming (p. 237–239).
3. Hon. Walter K. Granger, Representative in Congress from the State of Utah (p. 240).
4. Hon. John R. Murdock, Representative in Congress from the State of Arizona (pp. 240–244, 331–333).
5. Hon. Richard F. Harless, Representative in Congress from the State of Arizona (pp. 244–248).
6. Hon. William A. Dawson, Representative in Congress from the State of Utah (pp. 333–334).
7. Mr. Fred E. Wilson, attorney at law, member of the Colorado Basin States Committee, representing New Mexico (pp. 481–487).

It will be observed that all of these witnesses, except for those from Arizona, represented upper basin States; and all of the witnesses from upper basin States expressed strong opposition to the legislation, not only in its present form but

to any legislation of the same kind and character. It was pointed out that the proposed legislation would necessarily involve interpretation of the Colorado River compact and the Boulder Canyon Project Act, and that all the upper basin States would be affected by any such interpretation. It was further pointed out that such a suit, if brought, could and probably would be used as an excuse to delay authorization, not only of the central Arizona project, but of any major project in the upper basin. Therefore, the resolution would not accomplish the purpose for which it was intended, to wit: to facilitate development in the basin; but to the contrary, the resolution would delay and hinder development in the basin.

Mr. CARSON. Then I would like to furnish each member of the committee and have printed in the record in one place a resolution of the Colorado River Basin States Committee relating to House Joint Resolution 3 and allied resolutions now pending before Subcommittee No. 3 of the House Judiciary Committee, together with the accompanying statement which was adopted in Denver, Colo., on April 14, 1949.

Mr. MURDOCK. Without objection, they may be admitted to the record.

(The matter above referred to is as follows:)

RESOLUTION OF THE COLORADO RIVER BASIN STATES COMMITTEE RELATING TO HOUSE JOINT RESOLUTION 3 AND ALLIED RESOLUTIONS AND STATEMENT OF THE COLORADO RIVER BASIN STATES COMMITTEE RELATING TO HOUSE JOINT RESOLUTION 3 AND ALLIED RESOLUTIONS, ADOPTED APRIL 14, 1949

RESOLUTION

Whereas, House Joint Resolution 3, and allied resolutions have as their declared purpose the granting of consent to joinder of the United States as a party to interstate Supreme Court litigation involving the use of water of the Colorado River system; and

Whereas such litigation is of vital interest to the Colorado River Basin States because of the effect thereof upon the development of water use projects dependent upon the Colorado River system for a water supply; and

Whereas the general welfare of the United States and of the affected States requires that each Colorado River Basin State make use of its equitable share of the water of the Colorado River system in order that a great natural resource be beneficially utilized rather than wasted: Now, therefore, be it

Resolved by the Colorado River Basin States Committee, consisting of the States of Arizona, Colorado, New Mexico, Utah, and Wyoming, and open to the States of California and Nevada, That House Joint Resolution 3 and allied resolutions should not be enacted by the Congress of the United States for the following reasons:

1. There is no justiciable controversy.

2. Congressional consent to suit aids the proponents of litigation by wrongfully implying that there is a justiciable controversy.

3. The proposed litigation imperils the Colorado River Basin development essential to national welfare and national defense; be it further

Resolved, That the attached statement is approved as expressing the views of this committee and that the chairman of the committee is directed to forward a copy of this resolution with the accompanying statement to any and all congressional committees which may give consideration to House Joint Resolution 3 and allied resolutions.

STATEMENT OF COLORADO RIVER BASIN STATES COMMITTEE IN OPPOSITION TO HOUSE JOINT RESOLUTION 3

I. There is no justiciable controversy.

(*a*) A justiciable controversy may not be based upon an inchoate or contingent claim. For there to be a justiciable controversy within the purview of article III, section 2 of the United States Constitution there must be an existing or immediately threatened injury of serious magnitude established by clear and convincing evidence. (See *Nebraska* v. *Wyoming*, 325 U. S. 607, 608;

Colorado v. *Kansas*, 320 U. S. 383, 391–392; *New York* v. *New Jersey*, 256 U. S. 296, 309; *Washington* v. *Oregon*, 297 U. S. 517, 529; *Missouri* v. *Illinois*, 200 U. S. 496, 521.)

(*b*) No Colorado River Basin State is now suffering any injury resulting from the action of any other basin State with respect to the use of the waters of the Colorado River system.

(*c*) The lack of injury conclusively appears from the fact that 8,000,000 to 9,000,000 acre-feet of Colorado River water is annually wasted into the Gulf of California. (Senate Executive Report No. 2, 79th Cong., 2d sess., p. 4; H. Doc. 419, 80th Cong., 1st sess., p. 13, par. 29.)

(*d*) Neither California nor Nevada can show a present injury because there is a large margin between the present uses of water in each State and the quantity of use of water which each of those States admittedly may make. (Testimony of Chief Engineer Matthew of Colorado River Board of California in summer of 1947 was that total consumptive use in California of Colorado River water was 3,230,000 acre-feet annually—see hearings on S. 1175, 80th Cong., 1st sess., p. 412; H. Doc. 419 supra (p. 184) gives as present annual Colorado River depletions in California 145,000 acre-feet consumed in basin and 2,535,000 exported or a total of 2,680,000. These amounts are far below the 4,400,000 acre-feet of annual use mentioned in sec. 4 of the Boulder Canyon Project Act and the 1929 California Self-Limitation Statute. H. Doc. 419 supra (p. 184) gives the present annual Colorado River depletions in Nevada as 43,800. This is far below the 300,000 acre-feet of annual use mentioned in the Nevada water contract.)

(*e*) California may not claim a present injury when that State permits about 1,000,000 acre-feet of Colorado River water to be wasted annually into the Salton Sea. (See testimony of Senator McFarland presenting Bureau Reclamation table as to flow into Salton Sea, hearings before House Judiciary Committee on H. J. Res. 225, 80th Cong., 2d sess., p. 262.)

(*f*) There is no threatened injury to any Colorado River Basin State because there is no water use project under construction or authorized for construction which would utilize more than the equitable share of the State in which the project is located.

(*g*) The United States Supreme Court will not render declaratory judgments or give advisory opinions in interstate litigation. (See *Massachusetts* v. *Missouri*, 308 U. S. 1, 16; *United States* v. *Appalachian Electric Power Co.*, 311 U. S. 377, 423; *United States* v. *West Virginia*, 295 U. S. 463; *Alabama* v. *Arizona*, 291 U. S. 286, 291.)

(1) In no interstate water case has the United States Supreme Court ever acted in the absence of an existing or threatened injury.

(2) In each interstate water case in which the United States Supreme Court has granted relief that relief has taken the form of an injunction to prevent existing or threatened injury.

(i) In *New Jersey* v. *New York* (283 U. S. 336), the Court entered an injunctive decree limiting exportation of water from basin in order to protect downstream areas from injury to municipal water supplies, industrial uses, agricultural uses, recreation and fisheries.

(ii) In *Wisconsin* v. *Illinois* (278 U. S. 367, 281 U. S. 179), the operations of the Chicago drainage canal were limited to prevent the lowering of the level of the Great Lakes.

(iii) In *Wyoming* v *Colorado* (259 U. S. 419), the exportations of water from the basin were limited to prevent injury to downstream senior rights in Wyoming.

(iv) In *Nebraska* v. *Wyoming* (325 U. S. 589), upstream uses were limited to protect downstream uses.

(*h*) The decision in *Nebraska* v. *Wyoming* is no precedent for the claim that the United States Supreme Court will declare rights in the absence of existing or threatened injury because in that suit the Court found out-of-priority diversions in the upper States to the detriment of the low States which constituted an exising injury and because the authorization and construction of the Bureau of Reclamation's Kendrick project in Wyoming constituted a threat of injury to Nebraska.

II. Congressional consent to suit aids the proponents of litigation by wrongfully implying that there is a justiciable controversy.

(*a*) While Congress may not add to or detract from the jurisdiction of the United States Supreme Court (*Ex Parte Yerger*, 75 U. S. 85), Congress is presumed to know the tests which have been announced by that Court as determinative of the question as to the existence of a justiciable controversy.

(*b*) The passage of a resolution granting the consent of the United States to suit would probably be sufficient in and of itself to cause the Court to permit the filing of a bill of complaint and to prevent the early disposition of the case by the Court on a motion to dismiss.

(*c*) The consequence will be that the case will follow the pattern of presentation of evidence to a master appointed by the Court with the delay and expense incident thereto.

(*d*) Under the existing factual situation such a hearing before a master can only result in the ultimate dismissal of the case upon the ground no justiciable controversy exists under the tests applied by the Court.

III. The proposed litigation imperils the Colorado River Basin development essential to national welfare and national defense.

(*a*) A balanced national economy requires the utilization of substantial quantities of the water of the Colorado River for domestic purposes, for irrigation, and for hydroelectric power generation within the interior of the country.

(*b*) The 1947 report of the Bureau of Reclamation on the Colorado River (H. Doc. 419, supra) and the recently effective upper Colorado River Basin compact furnish the basis for such development.

(*c*) It is fair to assume that the pendency of the proposed litigation will be used by those opposing such development as an objection to the Federal authorization of Colorado River water use projects upon the theory that until the litigation is settled the share of water use available to each basin State will not be fixed.

(*d*) Plans for the development of the Colorado River are based upon the documents constituting the law of the river, viz: The Colorado River compact, the Boulder Canyon Project Act, the California Self-Limitation Statute, the Mexican Water Treaty, and the Upper Colorado River Basin compact. Congress should not, by granting the requested consent, raise any question as to the integrity of these documents.

(*e*) Experience has shown that interstate water litigation in the United States Supreme Court is time consuming and costly.

(1) There was litigation on the Arkansas River between Kansas and Colorado from 1901 to 1943 (*Kansas* v. *Colorado*, 185 U. S. 125; *Colorado* v. *Kansas*, 320 U. S. 383).

(2) Litigation between Wyoming and Colorado over the Laramie River lasted from 1911 to 1940 (see *Wyoming* v. *Colorado*, 259 U. S. 419, 455; 309 U. S. 572.)

(3) The Great Lakes drainage case, *Wisconsin* v. *Illinois*, was begun in 1925 (269 U. S. 527), a decree was entered in 1930 (281 U. S. 279) and the parties have returned repeatedly to the Court since then (see citations assembled by Justice Roberts in his dissenting opinion in *Nebraska* v. *Wyoming*, 325 U. S. 589, 664).

(4) The North Platte suit, *Nebraska* v. *Wyoming* was filed in 1934 (269 U. S. 527) and decree was entered in 1945 (325 U. S. 665). Commissioner of Reclamation Page in testifying before the Senate Committee on Irrigation and Reclamation on S. 649, Seventy-eighth Congress, First session, testified that the cost of that suit to the United States at that time amounted to half a million dollars. A conservative estimate is that the North Platte suit cost the four litigants at least $1,500,000.

(*g*) The States represented by this committee can ill afford to participate in the proposed litigation. Also, they cannot afford to postpone their needed development until the judicial processes have finally come to an end.

Colorado River Basin States Committee: Arizona, Charles A. Carson and Wayne M. Akin; Colorado, Clifford H. Stone and Frank Delaney; New Mexico, Fred E. Wilson and John H. Bliss; Utah, William R. Wallace and Clinton Vernon; Wyoming, L. C. Bishop and H. Melvin Rollins.

Special subcommittee on Suit Resolution: Utah, J. A. Howell, Chairman, Oregon, Utah; Arizona, Charles A. Carson, Phoenix, Ariz.; Colorado, Jean Breitenstein, Denver, Colo.; New Mexico, Fred E. Wilson, Alubquerque, N. Mex.; Wyoming, Arthur H. Kline, Cheyenne, Wyo.

Mr. CARSON. Then I would like to furnish each member of the committee with a copy and have printed in one place the application of the Arizona Power Authority in a letter to Secretary Krug dated April 26, 1949, in which the Arizona Power Authority applies for

all of the electrical energy that may be generated at Bridge Canyon Dam.

Mr. MURDOCK. Without objection, the letter to the Secretary of the Interior may be admitted at this point in the record.

(The letter above referred to is as follows:)

ARIZONA POWER AUTHORITY,
Phoenix, Ariz., April 26, 1949.

Hon. JULIUS A. KRUG,
Secretary of the Interior, Interior Building,
Washington, D. C.

DEAR SIR: Application is hereby made for all electric energy which may be generated and developed at that certain proposed public works project known as Bridge Canyon project on the Colorado River or so much thereof as may, by law, rules and regulations, be made available for use within the State of Arizona.

Throughout its history, Arizona has been short of electric power resulting repeatedly in great damage and frequent interruptions to the entire economy of the State in the industrial, agricultural, and social fields.

A recent survey of the power field for our State indicates that after using the entire output of Parker, Davis, and Boulder Dams made available to the State of Arizona, plus the entire generation output of generating capacity within the State, Arizona will still suffer from power shortage and that such a shortage will continue until power becomes available from the proposed Bridge Canyon project.

Arizona possesses vast quantities of raw products which have remained unused and undeveloped through the history of the State because of power shortage.

Our engineers have exhaustively studied the possibility of substituting power generation within the State using our cheapest priced fuel—natural gas, but further advise us that power can be sold at Bridge Canyon much cheaper than we can supply it from any other source.

We not only have great need for additional power in order to make proper use of these natural resources, but we must have increasing quantities of power to even maintain our present economy. For a number of years past there has been a slow-down in our mineral, agricultural, woodworking, metal activities, transportation, and other industrial and commercial lines because of increasing demands for additional motive power. For the reasons stated, we trust that due consideration will be given to our application and if additional information or data may be required we stand ready to supply the same and to meet for such conferences regarding our application as you may deem advisable.

Respectfully yours,

ARIZONA POWER AUTHORITY,
M. J. DOUGHERTY, *Chairman.*

Mr. CARSON. Then, Mr. Chairman, I would like to submit for printing in the record in one place and furnish each member of the committee with a copy of the report on the central Arizona project prepared by the Doane Agricultural Service, Inc., of St. Louis, Mo., at the request of the Arizona Interstate Streams Commission. The Doane Agricultural Service has in the back of its report a statement of its experience in making appraisals of agricultural areas and projects, and I think it is a very informative report.

Mr. MURDOCK. I have examined the report. I think this is important in a number of respects. Without objection, this may be admitted to the record at this point.

(The report above referred to is as follows:)

REPORT ON CENTRAL ARIZONA PROJECT TO ARIZONA INTERSTATE STREAM COMMISSION, WAYNE M. AKIN, CHAIRMAN, STATE OFFICE BUILDING, PHOENIX, ARIZ., BY DOANE AGRICULTURAL SERVICE, INC.

SUMMARY AND CONCLUSIONS

The information developed on the agricultural phases of the central Arizona project is briefly summarized as follows:

1. The central Arizona project has been proven as well adapted to irrigation. The proposed irrigation investment carries little or no risk from the standpoint of the productive capacity of the land and its adaptation to irrigation. The lands are minerally rich and productive.

2. Farmers of the area can afford to pay $4.75 per acre-foot for the irrigation water, which is the amount proposed in the Bureau of Reclamation report.

3. The Federal taxes produced by the maintenance and stabilization of the agricultural productivity of the region affected will repay to the Federal Treasury much, if not all, of the costs of the project that are incurred by the Government for agricultural purposes.

4. The indirect benefits of the irrigation will equal or exceed the direct benefits to the farmers. These reach out across the Nation and affect many people and businesses.

5. Consumers generally will benefit by more health and protective foods and by lower food costs.

6. The central Arizona project is an important national defense project.

It is strategically located.

Food is essential for fighting a successful war.

The power that the dams will supply is urgently needed now for industries of Arizona and other Southwestern States, and will be critically needed in the event of another war.

7. These lands are located in a climate that permits crop production all year. Some of the most profitable crops are grown during the winter when fresh vegetables are scarce.

8. The central Arizona project will save a very large investment in farms, irrigation developments, homes, public improvements, utilities, civic and religious developments, and other town and city properties.

9. There will be residual or permanent values remaining long after the project investment has been repaid. There will be a going irrigation and power development remaining for use for hundreds of years, and the land will continue productive for thousands of years.

10. These soils are minerally rich and produce health foods that are shipped all across the Nation. They are especially needed by city people.

11. The diet deficiencies of the United States will increase with the growing population and the declining fertility of the cropland soils.

12. The cropland to go out of production unless Colorado River water is made available provides enough food for liberal health diets for 200,000 to 300,000 people, equal to the entire population of a city the size of Syracuse, N. Y., Dayton, Ohio, or Richmond, Va.

13. The greatly increased population of California and the other west coast States is requiring much larger supplies of milk and meat. Maintaining the fertile lands of the central Arizona project in production means cheaper milk and meat for Los Angeles and other west coast population centers.

14. Present food shortages will become more acute. The food production of the United States is less than is consumed in this country. In every year from 1925 through 1941, the United States was a net food importer.

15. "The total population will continue to grow through 1975 * * * about 20 percent or 30,000,000 people * * * a population of 174,000,000 by 1975 * * * total food consumption might reach 150 percent of the 1935–39 level by 1960 and 165 percent or more by 1975." (USDA Rept., House Committee on Agriculture.)

16. A shortage of cropland is developing. By 1975, there will be only about 2 acres of cropland per person, unless more cropland is brought into use.

"With average yields, about 2 acres will produce the food required by one person for a low-income diet. It takes 3 acres or more per person to supply the food for a liberal diet." (Report of Secretary of Agriculture, 1947.)

17. "We have no more land to lose," according to Dr. Hugh H. Bennett, Chief of the United States Soil Conservation Service. "Actually, we need more good land for crops now."

18. The central Arizona project area normally will not produce the crops that cause major surplus problems, but will produce those that help overcome deficits of meat, milk, eggs, and other health and protective foods.

Since much of the production is in the winter and there is large consumption of the foods in the Southwest, these lands tend to be noncompetitive with farm lands in the Central and Eastern States.

19. The proposed protection of the large investment of citizens in the 226,000 acres of productive cropland and the towns and industries supported by this production is in keeping with the established policies of the Federal Government.

Flood-control work is done with no obligation on the part of those protected to repay the costs. The same is true of soil-conservation work and other protective activities of the Federal Government.

This proposed protective measure, in contrast, does provide for repayment to the Federal Treasury of all reimbursable costs.

20. The Bureau of Reclamation estimates 226,000 acres of irrigated land will go out of production unless the Colorado River water is made available for irrigation to maintain the irrigation water supply.

21. The University of Arizona estimates the crop acreage to be lost may be 350,000 acres if Colorado River water is not made available. This is well over one-third of the total irrigated acreage of Arizona. If this takes place, the economic impact on both the State and the Nation will be very great.

22. Over two-thirds of the total construction cost will go into concrete dams, reservoirs, aqueducts, concrete-lined ditches, and other canals and structures that will be maintained under the project plan and will undergo limited physical depreciation because they are built of concrete and other durable materials.

23. Maintenance of the productivity of this total area will help maintain the market for industrial goods. This is of vital importance to all producers of manufactured goods.

CONCLUSIONS

Our conclusions regarding the central Arizona project, based upon the report of the Bureau of Reclamation and upon other data and information, are as follows:

1. Farmers can pay the proposed charges for the irrigation water.
2. There will be large indirect economic benefits to consumers generally and more especially to the citizens of Los Angeles and of other parts of California.
3. There are large indirect benefits to processors, transportation companies, merchants, and industries. Eastern and west coast industries will be most benefited.
4. This is an important national defense project.
5. Based on the costs allocated for repayment by irrigation, the central Arizona project is a sound investment, both for the Government and for the farmers in the project area.

This report contains 51 pages, including 2 maps.

Respectfully submitted.

DOANE AGRICULTURAL SERVICE, INC.,
TRUE D. MORSE, *President*.

MAY 28, 1948.

AUTHORITY
